Acerca de este libro

Esta es una copia digital de un libro que, durante generaciones, se ha conservado en las estanterías de una biblioteca, hasta que Google ha decidido escanearlo como parte de un proyecto que pretende que sea posible descubrir en línea libros de todo el mundo.

Ha sobrevivido tantos años como para que los derechos de autor hayan expirado y el libro pase a ser de dominio público. El que un libro sea de dominio público significa que nunca ha estado protegido por derechos de autor, o bien que el período legal de estos derechos ya ha expirado. Es posible que una misma obra sea de dominio público en unos países y, sin embargo, no lo sea en otros. Los libros de dominio público son nuestras puertas hacia el pasado, suponen un patrimonio histórico, cultural y de conocimientos que, a menudo, resulta difícil de descubrir.

Todas las anotaciones, marcas y otras señales en los márgenes que estén presentes en el volumen original aparecerán también en este archivo como testimonio del largo viaje que el libro ha recorrido desde el editor hasta la biblioteca y, finalmente, hasta usted.

Normas de uso

Google se enorgullece de poder colaborar con distintas bibliotecas para digitalizar los materiales de dominio público a fin de hacerlos accesibles a todo el mundo. Los libros de dominio público son patrimonio de todos, nosotros somos sus humildes guardianes. No obstante, se trata de un trabajo caro. Por este motivo, y para poder ofrecer este recurso, hemos tomado medidas para evitar que se produzca un abuso por parte de terceros con fines comerciales, y hemos incluido restricciones técnicas sobre las solicitudes automatizadas.

Asimismo, le pedimos que:

+ *Haga un uso exclusivamente no comercial de estos archivos* Hemos diseñado la Búsqueda de libros de Google para el uso de particulares; como tal, le pedimos que utilice estos archivos con fines personales, y no comerciales.

+ *No envíe solicitudes automatizadas* Por favor, no envíe solicitudes automatizadas de ningún tipo al sistema de Google. Si está llevando a cabo una investigación sobre traducción automática, reconocimiento óptico de caracteres u otros campos para los que resulte útil disfrutar de acceso a una gran cantidad de texto, por favor, envíenos un mensaje. Fomentamos el uso de materiales de dominio público con estos propósitos y seguro que podremos ayudarle.

+ *Conserve la atribución* La filigrana de Google que verá en todos los archivos es fundamental para informar a los usuarios sobre este proyecto y ayudarles a encontrar materiales adicionales en la Búsqueda de libros de Google. Por favor, no la elimine.

+ *Manténgase siempre dentro de la legalidad* Sea cual sea el uso que haga de estos materiales, recuerde que es responsable de asegurarse de que todo lo que hace es legal. No dé por sentado que, por el hecho de que una obra se considere de dominio público para los usuarios de los Estados Unidos, lo será también para los usuarios de otros países. La legislación sobre derechos de autor varía de un país a otro, y no podemos facilitar información sobre si está permitido un uso específico de algún libro. Por favor, no suponga que la aparición de un libro en nuestro programa significa que se puede utilizar de igual manera en todo el mundo. La responsabilidad ante la infracción de los derechos de autor puede ser muy grave.

Acerca de la Búsqueda de libros de Google

El objetivo de Google consiste en organizar información procedente de todo el mundo y hacerla accesible y útil de forma universal. El programa de Búsqueda de libros de Google ayuda a los lectores a descubrir los libros de todo el mundo a la vez que ayuda a autores y editores a llegar a nuevas audiencias. Podrá realizar búsquedas en el texto completo de este libro en la web, en la página `http://books.google.com`

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

The Smallest Magneto Telephone

DIMENSIONS.

Width	5 inches
Depth	4 inches
Height	7¼ inches

The Wesco Long Distance Residence Telephone Model No. 51 is the smallest and most compact Magneto Telephone made.

It is especially designed for use in residences where wall space is limited and where ornamental design and beauty of finish are as essential as the efficiency of the working parts.

It is equipped with our Standard Receiver, Hook-Switch, Long Distance Solid back Transmitter, 80 ohm ringer and 3-bar Generator, each part being the best that money can buy. It is also made with 4-bar Bridging Generator with 1,000, 1,600 and 2,000 ohm ringer movement.

Gould Plate Construction

The following points are clearly brought out in the accompanying illustration of a fragment of the Gould Plate.

1. Large contact surface for active material.
2. The ribbed surface developed by our "spinning" process.
3. The central web of conducting lead.
4. The current-distributing cross bars.

More than any other type, the Gould Plate fulfils every scientific requirement for economy, efficiency and long life. It will pay you to investigate. Bulletin upon request.

JUST A SUGGESTION

Take one of your busy 4-party lines and equip it with "POOLE" Lock-Outs. Leave it in service a month and then see how many of the four will stand a raise of $3.00 a year rather than go back to the old way. We know the answer, but we want your subscribers to impress on you the fact that the "POOLE" Lock-Out is a rate-raiser.

It won't cost you anything to try it, because we will loan you the Lock-Outs free and there is no other equipment required. Write today for our Booklet AL-2.

You Wouldn't Start a Horse Car Line

in this age of electric cars? Not if you wanted to make money out of the business of transportation.

Then why should you start a manual telephone exchange in this age of automatics, if you want to make money out of the telephone business?

The automatic system of telephony bears the same relation to the manual system that the electric car does to the horse car. It is the apotheosis of telephone development, as the electric car is of transportation development.

The automatic telephone system produces the best service more economically than indifferent service can be produced with manual equipment.

There is no more question as to the relative popularity of the automatic and manual telephone service where the two kinds are in competition than there is as to the relative popularity of the trolley car and the horse car.

And, as for the securities—the same comparison may be applied with the same results.

Our Automatic system has been adopted in the following cities:

Aberdeen, S. D.	Clayton, Mo.	Jonesboro, Ark.	Ocean Park, Cal.	Springfield, Mo.
Akron, Ohio.	Cleburne, Texas.	Lake Benton, Minn.	Pentwater, Mich.	St. Marys, Ohio.
Albuquerque, N. M.	Columbus, Ga.	Lewiston, Me.	Portland, Me.	Tacoma, Wash.

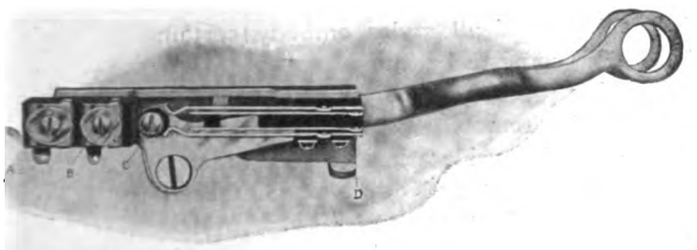
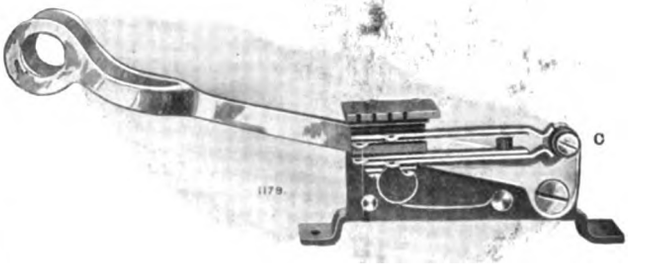
Stromberg-Carlson Efficiency and Durability are well and favorably known. The accompanying illustrations show two styles of Hook-switches, which for simplicity and mechanical construction are characteristic of Stromberg-Carlson Apparatus.



The movement of the hook downward causes the hard rubber insulated pin (C) to be drawn in between the German Silver springs, thus breaking contact, while the upward movement of the hook allows them to come together and close the circuit. The very best of materials only are used. Thorough reliability and the highest efficiency are guaranteed. Manufacturers of Telephones and Switchboards of the highest grade for all classes of service.



If you will mention your requirements and this advertisement, descriptive bulletins will be mailed free.

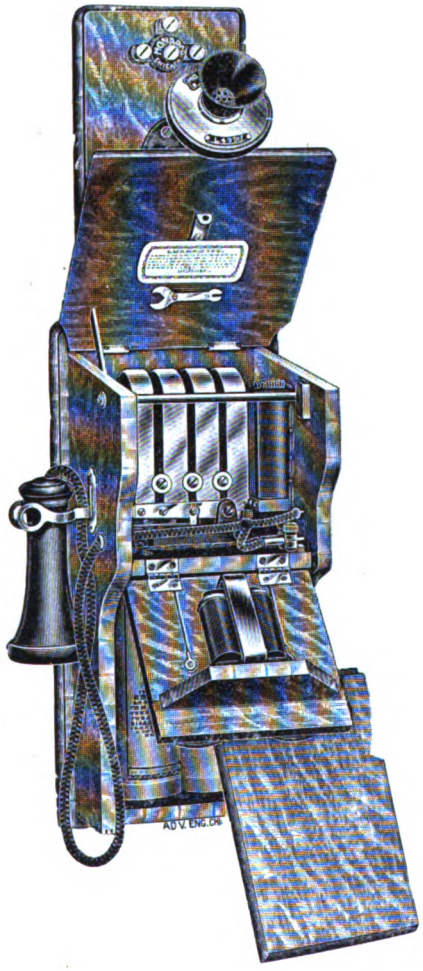
MONARCH



"Characteristics"

Monarch Telephones of all styles embody certain features which have come to be known as the "Monarch Characteristics." Perfect mechanical construction is the first and foremost. Every little detail is given the most careful consideration and the finished parts are naturally efficient and durable. Simplicity is another very desirable feature and is always noticeable in Monarch products. Convenience of assembly is given its share of study and consideration, with the result that every part can be removed easily and quickly.

The removable shelf in the telephone and the removable drop coil in the switchboard are two examples of this characteristic. Little appliances and conveniences to save time and annoyance are sought and when found are embodied in the apparatus. The gong damper on the compact telephone is one of these, which is appreciated by subscriber as well as operator.

There is a reason why Monarch Apparatus gives just the service desired. Study its characteristics and the reason is apparent. Catalogues will be sent upon request.

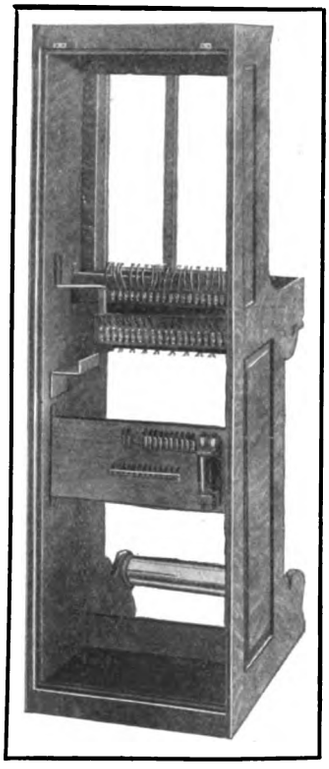
KELLOGG

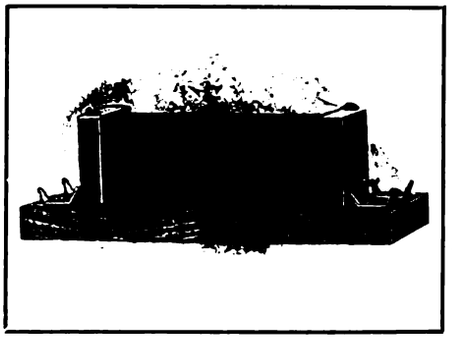
TELEPHONE APPARATUS



Magneto Switchboards

CONTAIN THE

KELLOGG INDUCTION COIL



This operator's induction coil is the result of the most careful experiments and consideration.

The size and material of this core, the ratio of the number of turns of the primary and secondary windings and the mechanical construction of this coil enable it to meet fully the most exacting requirements of both local and long distance work.

THE CORE is made up of a bundle of annealed iron wires.

THE BASE is of maple 6x2x½" with two terminals mounted at each end for the windings, one primary and one secondary lead appearing at each end.

THE SECONDARY is very highly wound, making the coil very powerful for long distance work, and also enabling the operators to talk in a low tone of voice while handling local calls. This diminishes the confusion of talking in the operating room to a minimum.

This coil should be used wherever a Kellogg transmitter is in service, in order to secure the best results.

Note the position of the induction coil in the above cut. It is easily accessible and neither interferes with nor is in the way of any other part of the apparatus in the switchboard.

Write for Bulletin "No. 9-A," which completely describes our Magneto Switchboards.

Drawing in the New York-New Haven Underground Cable

By John Putnam.

(Illustrations from Photographs by the Author.)

WHILE the method of drawing in the underground cable which was recently laid between New Haven and New York City may not be particularly new, it is conceivable that a description of the work may be of some interest to telephone men, both on account of the rapidity with which it was done and the magnitude of the construction involved. Its object was to get in place a heavy gauge cable, of the same type, and to be used for purposes of the same order as the underground toll line cables which are now working in several places in the Eastern States. Among these may be mentioned one from Boston to Brockton, Mass., about twenty miles long, and one from Boston to Worcester, Mass., a little over forty miles in length. The one from New York City to New Haven, Conn., is longer than these two put together, being approximately seventy-five miles in length. Dr. Pupin's application of the loading coil to telephony has, of course, made such underground circuits a possibility.

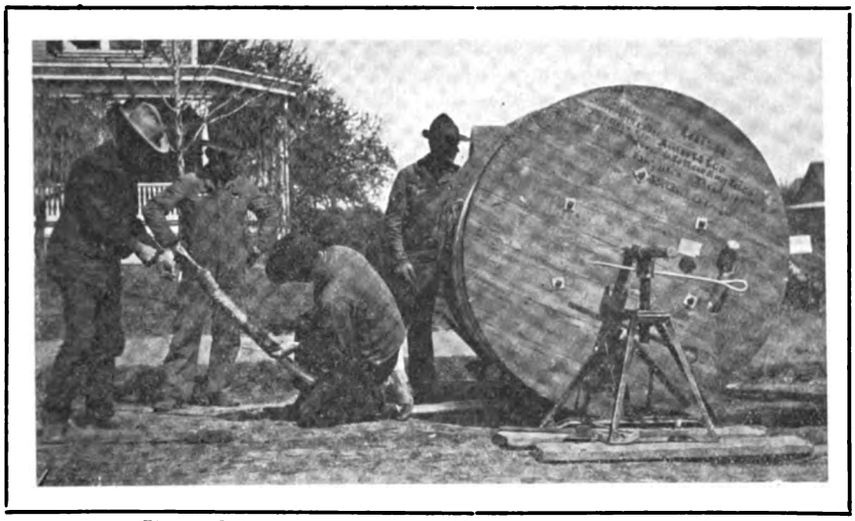

Fig. 1. Putting the grip on the cable, preparatory to drawing in.

The subway containing this cable was built in the fall of 1905. In the cities the conduit is of vitrified tile, single duct, while in the country it is of vitrified tile, multiple duct, or of creosoted wood, the last being used in rocky or swampy ground. In rocky ground there is less liability to injury to the wood duct in case of other blasting being done in the highway, and in swampy ground there is with the creosoted wood no need of cement being used. The number of ducts varies, of course, with the situation of the conduit, carefully made conduit studies determining their number in the cities. The manholes are of brick, oval in shape and with round iron covers. During the spring of 1906 work was begun drawing into this subway a toll line cable.

The picture that illustrate this article were taken just west of Bridgeport, Conn., and show the various steps in the process, we hope, interestingly. In the one showing the first operation, designated as Fig. 3, a reel of the cable has been raised from the ground by means of jacks, and two men, one standing on each side of it, are knocking off the lagging, or protecting strips, by simultaneous blows with hand axes. This seems a small matter to dwell upon, but watch the next cable gang seen do the same act, sometimes with

Fig. 2. Unreeling the cable and passing it into the manhole.

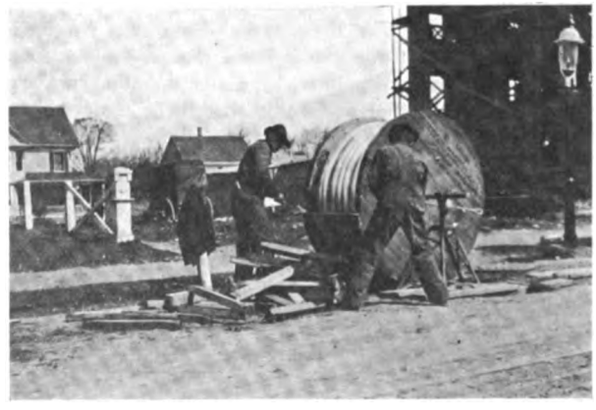

Fig. 3. Stripping the lagging from the cable reel.

173975 Digitized by Google

a crowbar, sometimes with a carpenter's hammer that has seen better days, but most always awkwardly, and it will be realized that it is not so simple. The men in the picture are experts, and in less time than it takes to tell it the lagging is strewn upon the ground and the cable is ready for the hitch attaching it to the drawing in rope.

In Fig. 1 are seen the men putting on the sleeve. Its style is the familiar wire network grip. Like the bamboo toy known as

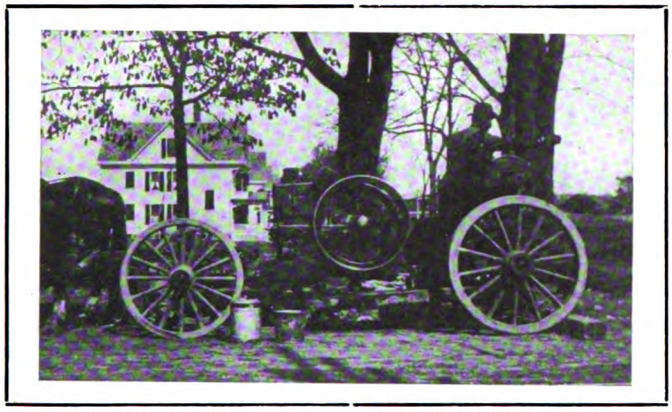

Fig. 4. Gasolene engine, mounted on truck. The engineer controls the speed of the drum with the lever in his right hand.

a "pull finger," the harder one pulls, the tighter it draws. At the end, the eye to which the pulling in rope is attached is plainly seen. The men are tying the end of the grip to the cable with marlin, in order that the first pull may not draw it off the cable, and that it may have time to tighten. The duct has, of course, been rodded and a piece of iron wire drawn into it. This wire is pulled out of the manhole near the reel, and hitched to the rear of the accompanying construction wagon. At the next manhole up the street a wire rope is fastened to the iron wire. The wagon is then driven down the street, drawing the iron line wire out of the duct and the wire rope in. When the end of the wire rope appears it is fastened to the grip on the end of the cable, and the cable fed into the manhole and through the duct. Figure 1 shows this very well, and shows this simple operation so clearly that written description would seem superfluous.

Let us then walk down the street to the farther manhole and see what the motive power is. As will be seen by reference to Figure 4, it is simply a gas engine mounted on a heavy truck. The driving wheel of the gas engine is belted to an axle, which is geared to another axle upon which is a windlass. Around this windlass is coiled the pulling in rope. By means of a lever the drum of the windlass may be made fast or loose upon the shaft, consequently the speed of the engine being constant, the driver can vary the speed with which the cable is pulled. The picture was taken while the engine was going at full speed, and if the reader will look closely he will see the blurr of the spokes of the driving wheel, and the taut wire rope that is drawing in the cable.

The next question that will occur to the intelligent construction man is how to guide the rope from the duct out of the manhole and onto the drum connected with the engine. Figure 5 answers the question and shows the means employed. An upright is formed of two heavy timbers fastened together in the form of a letter A. Two grooved pulleys, one above the other, are arranged to revolve between the two joists. It will be noticed that these pulleys are adjustable in order that they may be adapted to various heights of manhole and depths of conduit. When the upright is used, it is placed in the manhole in the position shown in the picture, and the wire rope is run from the windlass over the upper pulley, under the lower pulley, and into the duct.

NEW YORK CITY'S TELEPHONE GROWTH.

AS coming from the city having a larger number of telephones than any other of the world's great centres of population, the figures for the growth of the telephone system of New York City have a special interest. During the year just closed the net gain in the entire territory of the two companies having their headquarters in New York which, generally speaking, embraces a radius of thirty-five miles from City Hall, was 67,000 telephones—nearly 200 a day.

This has increased the system to a size which is roughly indicated by the following approximate figures:

Number of telephones in service and under contract in combined territories of N. Y. Tel. Co. and the N. Y. & N. J. Tel. Co..	389,000
Number of buildings owned and occupied by telephone companies.	60
Number of new buildings in course of construction.....	6
Number of square feet of office space occupied by telephone companies	1,094,500
Number of central offices.....	82
Total number of employees.....	17,000
Average number of people per telephone.....	14

Attention has been drawn to the fact that, although complete statistics of foreign cities are unobtainable, a comparison shows that New York has more telephones than London and the ten other largest cities of Great Britain combined; not only more than Paris, but more than all the telephones in France, Belgium, Holland and Switzerland combined, and it has more telephones than are to be found in the twenty large cities in Germany.

INDEPENDENT TELEPHONE MEN OF THE FIFTH ILLINOIS DISTRICT MEET AT PEORIA.

WHEN the members of the Fifth District of the Independent Telephone Association met at Peoria recently representatives from the various companies in the district and from outside points devoted considerable time to a discussion of the developments which will follow the entrance of Independent lines into Chicago. The meeting was held with J. S. Daily, of Chillicothe, in the chair. A constitution for the association is to be drawn up and presented at the next meeting of the association by a committee composed of C. B. Cheadle, of Joliet; H. W. Bullock, of Eureka, and G. H. Glass, of Pekin. Many prominent telephone men of the State were present at this meeting.

NEBRASKA INDEPENDENTS MEET AT KEARNEY.

DELEGATES representing the Independent telephone companies in the towns of Kearney, Shelton, Grand Island, Hastings, Kenesaw and Elm Creek met at Kearney, Neb., a few days ago. Officers of the district association were elected as follows: Dr. J. H. Lyman, of Hastings, president; Fred Ashton, of Grand Island, vice president; E. C. Krewson, of Elm Creek, secretary and treasurer. A discussion of the proposition

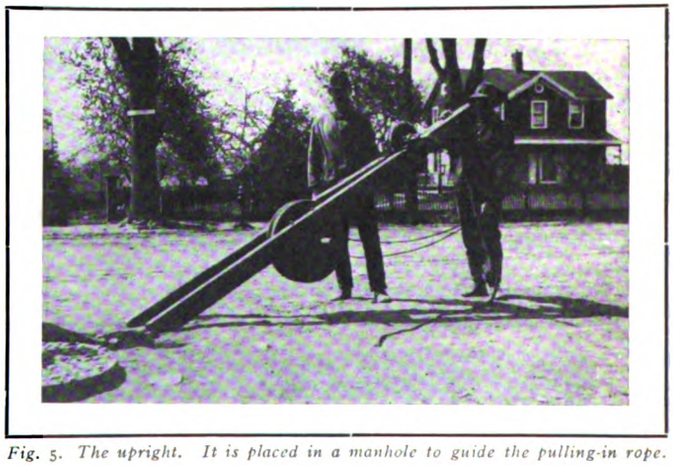

Fig. 5. The upright. It is placed in a manhole to guide the pulling-in rope.

of issuing a State directory containing the names of all independent telephone subscribers in the State was taken up, and the members expressed themselves as being in favor of the plan. As other districts have expressed a belief in the value of such a directory its publication is believed to be assured.

BOSTON ALDERMEN PASS INDEPENDENT FRANCHISE OVER MAYOR'S VETO.

AFTER it had been vetoed by Mayor John F. Fitzgerald of Boston the Board of Aldermen repassed the franchise which they recently granted to the Metropolitan Home Telephone Company. The final vote stood eleven to two in favor of the ordinance.

Toll Tickets and Collecting Forms

By Ernest A. English.

THE form of toll ticket illustrated in the figure which accompanies this article was devised especially for use in small exchanges which do a varied business both with the lines of the company which owns them and with other connecting companies. It will be observed that in the first place the ticket is unusually long and narrow, having dimensions of 5½ and 2¾ inches, respectively, for the length and width. This form was adopted in order to make it possible for the tickets to be laid upon a pasteboard backing in order to make them easy to handle at the switchboard. The operator, after filling in the information received when a call comes in, places the ticket upon this pasteboard backing and fastens it in place with a rubber band snapped over each end. Should she receive several calls and put them all through so that there are several tickets waiting for a circuit when the operator at a distant exchange is ready to establish a connection with the person desired, the operator can quickly locate the proper ticket. She has only to take off the band and she can then run very quickly through the pack of tickets and locate the proper one by the number or name at the left-hand end. The long narrow form of ticket is found to make this operation much easier than a square ticket, such as is most often used. This plan has been found to work out very well in practice, as the operator in the course of a day is able to save valuable time in the handling of a considerable number of toll calls.

This same style of ruling and printing is used for incoming

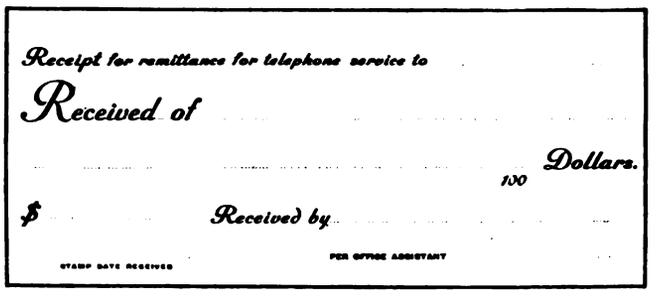
and outgoing messages. Colored forms are used for messages where collections are to be made at the distant end of the line, while white tickets are used for messages to be collected at the home office. This is the only distinction between tickets for messages in both classes, excepting in the maner of filling out. With regard to the color scheme in special cases attention may be called to the fact that an ordinary incoming ticket will be made out on a colored form, while an outgoing ticket will be made on a white form, by which it is readily distinguishable. When, however, the incoming ticket is to be charged to the person receiving the message—that is to say, when the ticket is reversed, it is made out upon the white form in the same manner as is ordinary for an outgoing ticket and the opposite of this is true for an outgoing reversed charge message. It is thus evident that all collections will be made for messages on white tickets.

Although space is provided on each ticket for very full information on each call, this is not filled in completely at the receiving station when the message is transmitted over only a short distance and between stations connected to the lines of the same company. In this case the operator at the receiving end has instructions to fill out only such parts of the ticket as are necessary to identify it for reference and the checking up of the sending station's ticket.

The space in the upper right-hand corner is only used for reverse tickets; that is to say, this is for messages on which



Receipt for remittance for telephone service to

Received of

Dollars.

$ Received by

STAMP DATE RECEIVED PER OFFICE ASSISTANT

Toll Ticket, Designed in Special Shape to Facilitate Handling at the Switchboard.

the receiving person pays the charges. The messenger charge and credit spaces are, of course, only used on tickets where it is necessary to send for a person to come to the telephone and ordinarily this charge is made against the originating end of the line. Quite frequently the messenger service is performed by one of the company's subscribers, this being especially true on outlying districts. In this case the messenger fee is credited to this subscriber and a record is made on the ticket under the head of "Messenger Credited to," at the right-hand side of the form. On the outgoing ticket the only items where a messenger service charge needs to be filled out is the "Time and Cost," while on an incoming form it is customary to at least fill out the space for "Time and Cost" of the message and "Messenger Credited to."

The headings of other spaces sufficiently explain the purposes for which they are to be used. They form a guide to the operator for the recording of all information necessary for the proper handling of all classes of messages, and fit readily into a simple system of bookkeeping, such as is frequently used by small telephone companies.

It has been found in using these tickets that it would probably be advantageous to reverse the places of the two items on the second line from the bottom, as upon the lines of the company using this ticket it is found that reference has to be made more frequently to the ticket to find out the name of the person to whom the message is credited than to whom the message is charged. If this were placed at the lower left-hand end of the ticket reference would be facilitated on removal of the rubber band which binds them to the form.

moreover a form which is familiar to the ordinary telephone user not trained to expect a special form from a telephone company. It is believed to be on this account rather pleasing to subscribers on rural lines.

PROGRESS OF INDEPENDENTS IN OHIO DISTRICT NO. 1.

THE following letter from the vice-president of the first district of the Ohio Independent Telephone Association speaks for itself. The table which is presented with it shows not merely that the Independent companies are in a very satisfactory state of development, but they are much in advance of their Bell competitors. The information was originally forwarded to the International Independent Telephone Association, to whose courtesy we are indebted for its reproduction.

J. A. Harney, Assistant Secretary, International Independent Telephone Association, Cleveland, Ohio.

Dear Sir: I attach hereto a statistical report of District No. 1 of the Ohio Independent Telephone Association, which is self-explanatory. It is interesting to note that there is an increase over March, 1906, for the same territory, in Independent telephones, of four thousand, one hundred and thirty-four (4,134), The figures shown on the attached statement are very conservative, no attempt being made to "jolly" the Independents in this district.

It is also with a great degree of satisfaction that I am permitted to mention that the telephone companies in this district are all, without a single exception, in excellent shape. Reference can be made particularly to the situation in Geauga County, in which county the various Independent companies have banded together and formed an association by themselves, and besides giving very excellent service have improved their plants by rebuilding pole lines, and replacing iron circuits with copper.

Facts could be stated also in connection with the rest of the telephone companies in this district if space permitted, which would show without question a very satisfactory condition existing.

We were unable to obtain accurately the number of Bell telephones in Cuyahoga County, but the amount credited is a very liberal estimate of the number of their subscribers taken from their claim in the newspapers.

With reference to the service of the Independent Company in this county, would mention that through the expenditure of a great deal of money the equipment is now in such excellent condition that the local company is able to furnish as good a service as any other company in the country, either Bell or Independent.

Yours very truly,

C. L. NORTON,
Vice-President of District No. 1.

November 1, 1906.

Table Showing Conditions in the First District of the Ohio State Independent Telephone Association, November 1st, 1906.

BUFFALO BELL LOSES CITY BUSINESS.

RECENTLY there has been a controversy in official circles of Erie County, New York, over telephone rates.

It has been a known fact that in years past, before competition was introduced by the Fontier Telephone Company, the Bell Company had been making the tax payers of Erie County and the City of Buffalo pay exorbitant rates for its poor service. Not many years ago the people of Buffalo were paying to the Bell Company an annual rental of $70 for the use of 500 calls, a little over one a day, and for any in excess of this number at the rate of 10 cents apiece.

Collusion with city officials has been repeatedly charged, owing to the fact that the Bell Company has received from the city, absolutely free of charge, valuable grants of franchise, rights-of-way, in fact, almost anything that was asked for. The fire and police departments have had up, from time to time, the proposition of installing their own switchboards, to reduce the amount of their large telephone bills. They have paid extremely high rates and secured such indifferent service that it was said to be no protection to the citizens.

Until recently, these departments were unable to install their own switchboards. These conditions have been overcome, however, through the general recognition by the people of the extent of the development of the Frontier Company in Buffalo, and the fire department is now installing its own private branch exchange switchboard, which will be connected with the system of the Frontier Telephone Company exclusively.

The only way the public of Buffalo can then reach any fire house or fire headquarters will be over the Independent system.

The Bell Company was approached for rates and asked by the fire department to connect with the city's system, but the management of the Bell Company refused, on the ground that the contract with the Boston trust would not allow them to connect with a system other than that established by themselves and owned and controlled by them. The result is that the city and county of Erie are preparing to completely relieve themselves from dealings with the Bell interests.

The question of most recent issue promises to be a merry fight between the board of supervisors of Erie County and the Bell Company. The latter organization has on hand its smooth talkers, their lawyers, and their columns of figures of misrepresentations. They seem now to be without special and secret influence in the city and county buildings, and are compelled to fight in the open against a body of men who have realized the people's rights and are making an effort toward fairness and justice to all concerned. The man who started the agitation, Charles F. Sturm, the county auditor, whose high reputation was attained by bringing to light the graveyard scandal, which has already sent four men to jail and promises to make it unpleasant for many others. Charles F. Sturm, known as the watchdog of the Erie county treasury, figured up one day and wondered why it was necessary to have two systems in the city and county buildings. It was reported by the various departments of the government that the Frontier was just as available for their business as the Bell and the Bell rates were much higher, and that they could create a great saving for the county by having a Frontier telephone or making the Bell Company reduce its rates.

Meetings were called and discussion heard on all sides, by the people, heads of departments, and the Frontier and Bell companies. Facts concerning the Frontier Telephone Company, set forth in large part by its contract agent, Mr. G. Barrett Rich, Jr., confirmed the impression that it was not only giving admirable service, but had developed the territory very thoroughly.

The supervisors wanted the Bell Company to come down to the price of the Frontier, and to give unlimited service. The Bell Company argued that unlimited service is a poor system for business, saying that it was desirous of giving the young business man an apportunity of installing a telephone at a reasonable cost, instead of having to pay the same price a prosperous man would pay. Imagine the Bell Company taking care of and having sympathy for a young man in business! This is rather a bad argument, as the lowest Bell business rate is $60 for 1,200 calls, against

Digitized by Google

a Frontier rate of $48 per year with unlimited service. When confronted with this argument the Bell representatives were unable to make an answer.

The Bell Company were asked by the Board of Supervisors to give unlimited service on the same basis as that given by the Frontier Telephone Company. After considering the matter one week, they declined to do so, whereupon the board by a vote of forty-seven to one ordered them to remove all their telephones within six days.

This the Bell Company has done and the only telephone service now used in any of the Erie County offices is that of the Frontier Telephone Company, which connects with the lines of the Inter-Ocean Telephone and Telegraph Company for Independent long-distance service.

ERROR OF TELEPHONE OPERATOR SAVES LIVES OF FAMILY.

RINGING the telephone bell of J. V. Boyer, of Marion, O., in error when there was no call for his line, a telephone operator was the means of saving the lives of Mr. Boyer and his wife and daughter.

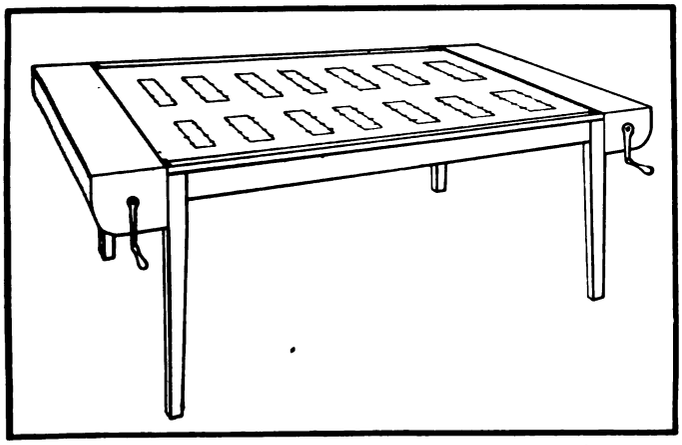
The house was afire, and when Mr. Boyer was awakened by the ringing of the bell he found his wife and daughter already unconscious from the smoke.

Filing Cable Maps

By O. R. Barnes.

SUSPENSION from the ceiling by means of suitable combinations of rollers, pulleys, ropes, etc., is the scheme for keeping their cable layout maps which has been approved and adopted by many large telephone companies. This is a convenient enough way of arranging those which show the city districts, but a very unsatisfactory method for the company whose field of operation covers many small towns. The reasons for this are not numerous and they may be simply stated; nevertheless they are good. It is obvious that a small town requires only a small map and many small maps suspended from a ceiling take up much room and present an untidy appearance. Then, too, maps hung in this manner quickly become dirty and wear out more rapidly than they should on account of the exposure to dust and other causes of injury. When such maps are taken down for a close examination they are likely to be left too long lying loose on tables and perhaps destroyed by rough or careless handling.

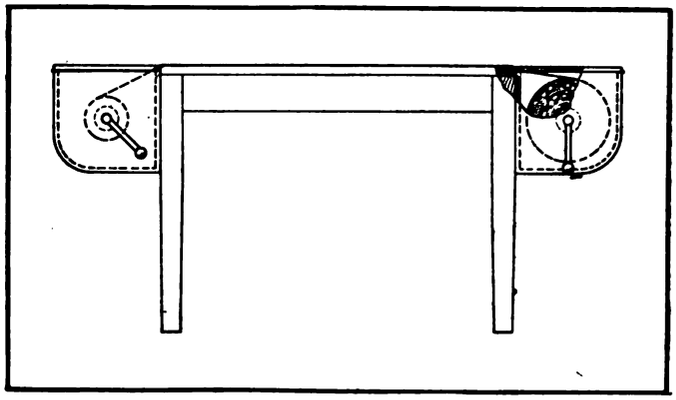
The device here illustrated overcomes many of the disadvantages of the methods mentioned. It is nothing more than an ordinary table with a box arrangement mounted on each end, in which is fitted a roller with a handle so that it can be rotated conveniently. A drum made of zinc is fitted onto the roller. A



General Appearance of Table Used for Filing Cable Maps of Numerous Small Exchange Districts.

heavy grade of linen cloth attached to both drums moves over the surface of the table as the rollers rotate. On this linen cloth, which is of sufficient length and width, are mounted the cable layout maps. The boxes have lids so that access can be had to the rollers in case they need adjusting. As the maps are mounted on the linen cloth they are numbered consecutively and a list is pasted on one of the lids giving the name and corresponding number of the various maps so as to facilitate the manipulation of the rollers in locating any particular map.

This table can also be used for the purpose of keeping record of the work in hand. Diagrams of the work to be done can be mounted on the linen cloth and as it progresses it can be checked



Side View of Table, With Roller Casing Cut Away to Show Approximate Arrangement of Parts.

off. When the work has been completed the diagram can be removed from the cloth with the aid of a wet sponge.

BUTLER COUNTY, OHIO, BEING THOROUGHLY DEVELOPED BY INDEPENDENT TELEPHONE COMPANY.

THE November issue of the directory of the Hamilton Home Telephone Company shows a considerable increase in subscribers over the numbers included in its previous issue, which came out last May. For the town of Hamilton 470 new names have been added, and not less than 640 additional subscribers have been connected to its lines through other exchanges in this territory. The Hamilton, O., *Sun*, commenting upon this remarkable growth, says that "the company's service in Butler County is almost universal, and quite indispensable to the business men."

In the make-up of the directory there are to be noted a number of interesting points. Upon the page facing the cover appear the numbers of the company's telephones, and the names of the officers and directors, as follows: Frank Hughes, president; Charles Griesmer, vice-president; J. W. Sloneker, secretary; F. W. Whitaker, treasurer; W. Gilbert Thompson, manager. Directors: E. H. Hughes, Frank Hughes, J. C. Slayback, Charles Griesmer, O. M. Blake, F. M. Barden, J. N. Sloneker, W. Gilbert Thompson and F. W. Whitaker.

On the page following are given the locations of pay stations, and after this comes a list of exchanges to which special long distance service is furnished. Rules for subscribers are given, and directions for obtaining long distance service over the lines of the United States Long Distance Telephone Company which enter the exchanges of the Hamilton Home company. Upon the pages devoted to the listing of subscribers are printed the advertisements of some of the most prominent business firms which have connections with the company's exchanges.

IN THE OPERATING FIELD

INDEPENDENT TELEPHONE MEN MEET AT LEXINGTON, ILL.

AT a recent meeting of representatives of Independent telephone companies held at Lexington, Ill., the following were present: J. Arnold, Cooksville; A. Fiesher, Fifer; Thos. Boyd, South Chenoa; Harry W. Cox, Hudson; Charles E. Monk, Fairbury; Gomer Jones, Prairoe Hall; W. E. Platt, Money Creek. G. C. Elder was appointed temporary chairman and Gomer Jones temporary secretary of the meeting. On motion of Mr. Monk the representatives of the different companies who were present voted to organize an association to be known as the Central Illinois Free Service Telephone Association. A committee was appointed to draw up by-laws and its report will be made at the next meeting of the association, which is to held in Chenoa, Tuesday, January 8.

CAMERA AND PLATES

SHOULD BE READY

BEFORE A SLEET STORM

READ the offer of prizes for the best article on building to prevent losses from sleet storms, published in American Telephone Journal, issue of December 29th, 1906. The offer is open to you ---you need not even be a subscriber---and is absolutely unencumbered by any charges or unfair conditions. Details of the offer, as they appeared in Dec. 29th issue, will be republished next week.

Read the offer carefully. Plan an article now. Keep your camera loaded. Then, when the storm comes, jump in, get your pictures, and send us the real stuff. Why can't you win that twenty?

ANNUAL MEETING OF THE SOUTH DAKOTA TELEPHONE ASSOCIATION.

ON January 9 and 10, 1907, there will be held at Sioux Falls, S. D., the fourth annual convention of the South Dakota Telephone Association. An exceedingly interesting program has been arranged. On Wednesday morning the hours from 10:30 to 12:00 will be devoted to a reception of the members and friends by the Executive Committee and officers at the Cataract Hotel. Beginning at 3 o'clock in the afternoon there will be a series of addresses by the following speakers: W. T. Doolittle, Sioux Falls, S. D.; Hon. C. B. Kennedy, Canton, S. D.; Geo. W. Burnside, Sioux Falls, S. D.; Geo. T. Hewes, Des Moines, Ia.; J. L. W. Zietlow, Aberdeen, S. D.; R. P. Crouthers, Brookings, S. D., and J. A. Steninger, Parker, S. D. The addresses of the South Dakota men will deal with the practical features of exchange operation, after a welcome by W. T. Doolittle, of Sioux Falls, and an address by the president, the Hon. C. B. Kennedy, of Canton, Mr. George T. Hewes will speak of his work in establishing and conducting a clearing house at Des Moines, Ia. In the evening addresses will be made by the following gentlemen: E. A. Bryce, Yankton, S. D., on Independent Toll Lines; H. P. Hartwell, Irene, S. D., Telephone Associations; F. C. Mariner, Northville, S. D., Needed Legislation; P. C. Holdoegel, Rockwell City, Ia., The Success of the Iowa Independent Telephone Association; A. S. Hall, Redfield, S. D., Is It to the Interest of Telephone Men That All Toll Lines Connect With Local Exchanges on Equal Terms; J. H. Shoemaker, Waterloo, Ia., Is a Toll Line Company Which Refuses Connection With an Independent Company to be Regarded as Independent?

On Thursday, January 10, the morning session will be devoted to an examination of the exhibits of manufacturers, while in the afternoon at 1:30, and at a continued meeting at 7:30, the business affairs of the Association will be discussed. At 11 o'clock in the evening there will be a banquet at the Cataract Hotel. The broad range of papers to be presented promises that the meeting will be exceedingly interesting, and it is hoped that the members will be prepared to take full advantage of the opportunity to become more closely in touch with the work of the Association. The officers of the Association are C. B. Kennedy, president, Canton, S. D.; J. A. Steninger, vice president, Parker, S. D.; E. R. Buck, secretary-treasurer, Hudson, S. D. Executive Committee: Geo. W. Burnside, Sioux Falls, S. D.; H. P. Hartwell, Irene, S. D.; M. B. Ryan, Beresford, S. D.; P. R. Crouthers, Brookings, S. D.

MEETING OF INDEPENDENT TELEPHONE MEN AT IRONTON, OHIO.

AT a meeting of the members of the Independent Telephone Association held at Ironton, O., H. P. Folsom, of Circleville, was chosen chairman, and B. F. Forgey secretary. Many interesting discussions of matters of general and local interest were held, and the members derived much pleasure and benefit from the meeting. U. T. Cox spoke at some length on the needs of the country exchanges, and the undesirable effects of free exchange. Among those who participated in the discussions were Col. H. A. Marting, F. L. Beam, Dwight E. Sapp, H. B. Mauck, L. D. Eaton, Lon Hutchinson, John Keyes, R. A. Knapp, John Ainsworth, H. S. Grimes, Dan Mossman, E. M. Hamilton, Wilson Prichard, John Woods, John Banks, Nat Burcham and others.

R. A. Knapp and U. T. Cox were appointed by the president of the meeting to present a plan for perfecting a permanent county organization.

After the business of the meeting was over the members met at a banquet in the evening, where the time was most enjoyably spent. Among the speakers at the banquet was F. L. Beam, president of the Ohio State Association, who said that the Independent companies are handling practically 85 per cent. of the business done in Ohio at the present time.

TELEPHONE KICKS PROSTRATE TROUBLE OPERATOR.

BESSIE LANE, trouble operator at the Bell exchange, say the Cleveland, Ohio, daily papers of Dec. 20th, is ill from nervous prostration brought on by receiving 60,000 wails since last January. "The continual strain brought on a collapse," said the girl Thursday. "When I woke up I thought that a horse had kicked me in the head."

QUERIES

SUPERVISION ON TRUNK CIRCUIT.—(807.)

We are about to go to work on the design of a trunk circuit. Can you tell us whether the disconnect signal should be given to the operator at the exchange nearer the called subscriber, or to the one who puts in the call? We cannot agree on this, and would like to have you give us a statement of the best plan, with the reasons why it is the best. B. R.

ALTHOUGH the wording of your question is not quite definite, we think the following reply will cover the current practice on the point concerning which you are inquiring. All supervision over a trunk connection, it is now generally agreed, should be concentrated, as far as is possible, at the position of the operator who receives the call and forwards it to a second operator for completion. The reason for this is that, as this operator is the only one who can communicate with the subscriber, she should be in a position to know immediately when the called subscriber at the distant exchange responds. She is thus in a position to deal intelligently with any communications relating to the connection which may be received from the calling subscriber. She knows instantly when the connection is completed, and thus is made aware that no further attention to a call, such as repeated ringing, etc., is necessary until one of the parties hangs up his receiver. If there should be any accidental interruption of a connection it is well to have signalling apparatus so arranged that the difficulty will be automatically indicated at the end where the call originates, as the connection may be more quickly and easily re-established through communication with the calling subscriber.

When the disconnect signal is received it should also come to the originating end, in order that the operator may clear the connection at the instant the conversation is terminated. Rapid clearing out of connections is more important at a subscriber's operator's position than at an incoming trunk position for several reasons. Among these may be mentioned that such a position handles a heavier load on an average than a trunk position, the capacity of which is limited by the capacity of the call wire to receive instructions. The face of the switchboard is also more obstructed by a given number of connections at such a position, as each subscribers' operator uses two cords for a call as against one cord per call for a trunk operator.

Other reasons for the practice can be given, but we believe the above will be sufficient to indicate the advisability of following the plan of giving the originating operator the entire control of a trunk connection. At the incoming trunk position the disconnect signal is lighted, of course, when the subscriber's operator removes her plug from the trunk—not when the called subscriber hangs up.

QUIET SUPERVISION.—(808.)

We have a two position magneto board with taps from both operators' sets wired back to the manager's office. The wiring of these taps terminates upon the respective end sets of clips of double pole double throw switches, the center points of which connect to the manager's set. Through this arrangement he can switch his telephone to either operator's set, and listen to the conversation she carries on. These lines run through condensers, and there is a condenser in the manager's talking set. The operators can hear sufficient noise when the manager takes down his telephone and cuts in on the line to enable them to detect the act, and so the efficiency of the supervision is impaired. Is there any way possible to wire this circuit so that the operators cannot hear the click when the receiver is taken down? W. M. B.

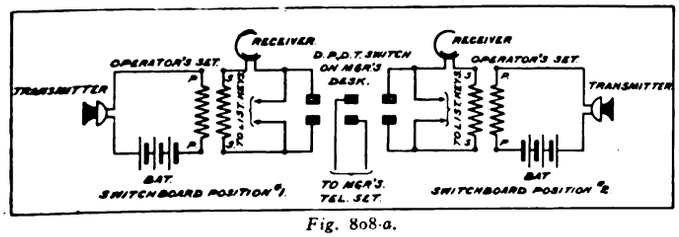

Fig. 808-a.

IN the diagram Fig. 806*a* is indicated a method of wiring the taps from operators' sets at the switchboard to the double-pole switch. You will see from this drawing that the simplest form of talking circuits is shown, from which the taps to the manager's supervising switch are taken directly off in multiple with the leads to the listening springs at the keyboard. As the switchboard is of the magneto type, we assume that there is no condenser in the receiver circuit. The only wiring necessary, then, from the switchboard to the switch will be two pairs of wires run directly and no condensers are necessary. We would also suggest that you cut the condenser out of the manager's talking circuit. In this way you will eliminate

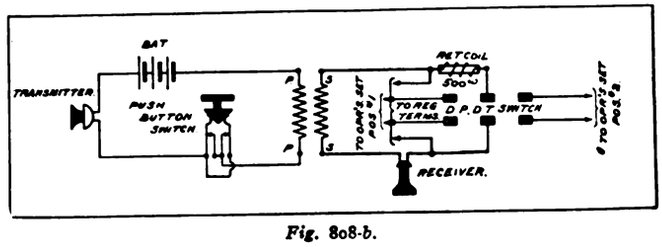

Fig. 808-b.

any possibility of a click due to a charge or discharge of this condenser, which would be likely to occur under a great variety of circumstances which can be mentioned. A condenser in a supervising circuit should be avoided wherever possible, as no arrangement of retardation coils will entirely smooth out the rush of current due to the condenser's charge or discharge.

Into the secondary circuit of the manager's telephone should be introduced a retardation coil of about 500 ohms resistance with a fair-sized iron core. This causes any variation in the current flowing through the operator's set, due to the action of this circuit in shunt with hers, to come on with comparative slowness, thus avoiding a click. It is advisable also to use some sort of a push button switch to open the primary circuit immediately before closing the supervisory switch. This key should be kept depressed during the time the manager is supervising in order to keep the operator from hearing tones transmitted from his position. The circuit for this set is indicated in a simplified form in Fig. 808*a*. It is to be noted that the retardation coil does not enter into the talking circuit when the manager's set is used with an ordinary line to which connection is made through the wires marked "To regular terminals" in the diagram.

KICK COIL TELEPHONES.—(809.)

THE subscriber who wishes to hear from operating men who have had experience with kick coil telephones is still looking for more information. Everyone who has had experience with this type of instrument is invited to write at once and tell the results obtained. Any available material will be accepted for immediate publication, and paid for at regular rates.

TRANSPOSITION.—(810.)

In constructing a telephone line one mile in length, with two six-pin arms, parallel with another line, with no other disturbance, what is the proper scheme for transpositions, with thirty-two poles and with forty poles to the mile? C. T. W.

THERE is no reason for transposing a line only one mile long unless there is a high potential transmission line on the same route. Transposition then depends on the distance between the telephone wires and the high potential circuit, and the proper plan may best be determined by experiment in each case.

THE EDITOR'S PAGE

UNDERGROUND LONG DISTANCE CABLES.

THE article on pulling in the New York-New Haven cable draws attention to a development of one branch of telephone work which is significant from more than one point of view. Perhaps the broader field for thought lies in the advances in the use of telephones for communication which have led to this concentration of wires for so considerable a distance. Telephone men are to some extent acquainted with the elaborate and expensive investigations undertaken subsequent to the announcement of Dr. Pupin's mathematical discoveries which have made it possible to transmit conversations through cable for a distance hitherto considered impracticable. The installation of these special loaded cables, each containing many wires, has since that time been completed along routes connecting a number of important cities. Their use is a convincing demonstration not only of the growth of telephone communication, but of the immense commercial value of the business messages which daily pass through such equipment.

PUSHING EXTENSIONS.

TELEPHONE companies which are now well established and have their lines run to a good proportion of the business houses and residences in their respective territories will in the future be compelled to give an ever increasing amount of attention to methods of acquiring new business. After development reaches a certain point there is usually a period when new subscribers come easily. The telephone habit seems then to be contagious, and all the solicitor has to do is to make a brief call and take the contract. Such enthusiastic reception of the mild efforts of the company, however, cannot long continue. All the people in certain classes, which may be more or less roughly defined and settled upon in advance as "easy prospects," will be found to be constant users of the service. Of the remainder many will have considered the matter and made an adverse decision. When approached some will make evasive answers, others will come out with a "No," prompt and firm, and the balance may at least be depended upon to sit back in their chairs and say "Show me." Then they must be shown, and that on the instant, too. Failure at the moment to bring forth a convincing line of argument will, unless the utmost tact is exercised, put the telephone company in the position of an adversary beaten in debate. The person approached finds himself suddenly in a new position. Before spending the money for a telephone he wished to justify the outlay. Most of the arguments in favor come from the company, those against are his own. If he gets the better he becomes firmly convinced that the time for subscribing has not come and his name may just as well be set aside for a few months. Effort is wasted. The prospect is lost.

Prevention of this kind of failures can only be accomplished through the exercise of some considerable foresight and study. The wise manager will realize that about the best preparation he can have for getting the maximum results in his own business is a good knowledge of that of his possible customers. If he has this he can proceed with a pretty fair degree of certainty. When the grocer demands to be shown the solicitor who is sent out goes primed with facts. He is able to put himself in the grocer's place. He knows how, if he were that particular grocer, he could use the telephone in such a way as to save the labor of a boy. There is something concrete. He has but to put it in words, to demonstrate it, and the contract is his. The same can be said of the method of approaching a man who owns a blacksmith shop. A single clear statement which will show how the telephone can be made an instrument to be used in carrying on his business is the thing. But the solicitor must know the blacksmith's business before he goes to the shop. Before he even sees the door he must be prepared to prove without faltering that the telephone is as essential a part of the fittings of such a place as the very forge. If he cannot do this and back up his statement solidly against possible contrary views of one who has been a blacksmith all his life he would better not undertake the job. Better to let the attempt wait a few days for the preparation than to turn the prospect into an opponent. So it goes all along the line. A large amount of business will be brought in by this sort of hammering. But the work will have to be done with skill and care to make the work worth while. And above all, let the preparation come before the trial.

Many will say this is too delicate work for the present. It is raking the field with a fine tooth comb and the time has not yet come for that. Such preparation takes too much time, costs too much money, to be wasted on isolated groups of individuals. If their development is in such a stage and the attitude of the public so settled that their judgment is correct, they must then turn to methods of broader scope. Their field lies in the creation of plans for awaking an interest. Publicity is what they will seek. Interest in the telephone service is to be aroused, and is to be aroused in a definite form. It must lead the person who is hearing about the telephone and seeing things about it in his paper and elsewhere to want one for himself. This is a fascinating field, where there is yet much to be done.

Then passing over the matter of extension sets, duplicate lines and other things which need not be touched upon there is the matter of toll service, which is of great and rapidly increasing importance. Here, again, there is required to a high degree a knowledge of local conditions. There is the advantage of partial familiarity on the part of the user with the commodity which is to be sold. When the service is good there should be little difficulty in pointing out things for which it can be advantageously used which will be new to nearly every subscriber. Ideas gathered from one will be useful to another.

Results obtained in the past indicate that the telephone business depends for its extension very much upon the amount of its use in actually developing the business of those who employ it. Strengthening his own position by contributing intelligently to the strength of the business which surrounds him will during the coming year occupy much of the attention of the alert and efficient telephone manager.

TALKING THROUGH YOUR CHEST.

PERSONS not familiar with the action of the vocal organs derive considerable amusement from carrying on a telephone conversation with the transmitter placed against their chests. With the instrument in this position the sound transmitted is reproduced with a loudness almost equal to that heard when the mouthpiece is immediately in front of the lips of the speaker. The voice of the speaker may be readily recognized, but there is sufficient alteration in the quality of tones to make it possible for a change from this position to the customary one to be readily detected.

Desk set users will do well not to attempt to muffle a transmitter by pressing it against their coats, as is sometimes done by persons who use the telephone while standing, if they wish to say things which should not be heard at the other end of the line.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

DAMAGE FROM FIRE.

Some electricity generated by an electric railway company which has a line near here escaped from its trolley wire to one of its span wires, thence to a telephone cable of our telephone company, then to a telephone cable of another telephone company in business here, thence to a gas pipe in a store building, thence to the lead connection with the gas meter in the basement, which was melted off, igniting the gas, setting fire to the floor above and damaging a stock of goods. The owner of the store wants us to pay for his loss, but we do not feel inclined to do so, as he cannot show any particular way in which we were negligent. Please give us your opinion of our liability in this case. F. H.

YOU are not liable in any way unless he can show some particular way in which you were negligent. Your negligence does not appear at all from the statement of facts you have given. See Marsh v. Lake Shore Electric R. Co., 7 Ohio C. C. (N. S.) 405, a case in which the course followed by the escaping electricity was quite as remarkable as the above, and in which no liability was found by the courts.

NOT A CASE OF DISCRIMINATION.

The Bell Telephone Company in this vicinity extended its lines through a recently settled part of the village without getting permission from the village trustees. Our company (Independent) has been in business for a number of years and has always complied with the law and never made any extension or new construction without permission from the proper authorities. The trustees have now passed an ordinance requiring the Bell people to place their wires underground, and the property owners in the locality where the extension is being put in have got out an injunction restraining the Bell people from building any farther on the surface. The contention of the Bell people is that they are being discriminated against, because we were not also required to put our lines underground. The ordinance does not require all of the Bell lines to be placed underground, but simply the new extension for which the company has not obtained permission. It does not seem to us that there is any discrimination because we are strictly within the law. Please give us your views and cite authorities if possible. L. A. T.

YOU are correct in your belief that the fact that the trustees required the extension to be placed underground without requiring your company to place your wires underground does not prove discrimintion. It was so held in a similar case entitled Village of Carthage vs. Central New York Telephone and Telegraph Co., 96 New York State, 919; 48 Miscellaneous, 423; 96 New York State, 917. In this case it was held that an injunction restraining the erection of lines pending an action to require the company building an extension to place its wires underground should not be vacated where the facts as the propriety of such action are in dispute.

HOME TELEPHONE COMPANY SEEKS REDUCED ASSESSMENT.

CLAIMING that its special franchises in Schenectady, N. Y., are overtaxed in proportion to its other property, the Schenectady Home Telephone Company is starting an action to have its assessment reduced and to have a thorough investigation of the system of assessment in the city made by the State Board of Taxation.

In its petition the company sets forth that the property in the city is assessed at 73 per cent. of its value instead of at market value as required by statute. The assessment of the special franchises of the company is said to be $70,000, and this amount is claimed to be the full value of the franchises. Thus the company is alleged to be paying taxes on an overvaluation to the extent of $18,900 according to the system in use by the city assessors.

The duty of the State Board of Taxation is to equalize the taxation and hence an appeal is made to them. It is pointed out that the system of levying assessments in this city is not in accordance with the statute, and that prejudicial acts should be investigated.

ATTORNEY GENERAL MAY HAVE ASSISTANCE IN PROSECUTING RATE CASES.

JUDGE LUDWIG, of Milwaukee, has decided that Attorney J. G. Flanders may assist Attorney General Sturdevant in prosecuting the State's case against the Wisconsin Telephone Company charging rate discriminations. The State brought suit against the Bell system to collect a forfeiture provided for in the statute which the last legislature enacted for the purpose of preventing discriminations in rates of service. The cities of the State were classified according to population and it was provided that no company maintaining telephone exchanges in more than one city of the same class should exact higher rates for service in one place than in the other.

This law was designed to prevent the Bell system from using what was charged to be unfair methods of competition against the Independent companies. It was alleged that the Bell companies would establish a ruinously low rate in one place until the Independent company was crushed out, and then would boost the rates high enough to make up for the sums lost in the competition. The law was not obeyed by the Bell system, it is alleged, and the Attorney General brought suit to collect the forfeiture. The Bell company's attorneys moved that the attorneys who appeared in the case for the Independents be forbidden to participate in the litigation, but Judge Ludwig holds that other attorneys than those representing the State may lawfully appear.

INDEPENDENTS MAY BUILD AT BLOOMFIELD, INDIANA.

THE injunction suit brought at Bloomfield, Ind., by the New Home Telephone Company whose lines cover Greene County, against James S. Edwards and other persons, of Lyons and Washington Townships, has been decided in favor of the defendants. The suit grew out of an attempt to prevent the defendants from building an independent system. A temporary restraining order was issued which has now been dissolved. The Independent promoters can proceed at their pleasure.

CHICAGO COMPANY CANNOT BE COMPELLED TO FILE STATEMENT OF GROSS RECEIPTS.

ACTION of the Circuit Court of Cook County, Ill., denying a writ of mandamus to the City of Chicago to compel the Chicago Telephone Company to file a semi-annual schedule of its gross receipts was upheld by a decision of the Appellate Court of the State on December 11.

The petition of the city prayed that the telephone company be required to file with the City Comptroller a true statement of the gross receipts and that the corporation be required to pay into the City Treasury 3 per cent. of the gross receipts.

TELEPHONE PATENTS

SWITCH FOR INTERCOMMUNICATING SYSTEM.

F. J. Ravlin and John Lofgren, Chicago, Ill., patent (No. 829,736; dated August 28, 1906; filed January 15, 1906; serial No. 296,001) and assign one-fourth to Arthur T. Averill, and one-fourth to Glenn M. Averill, Cedar Rapids, Ia., a switch for intercommunicating systems.

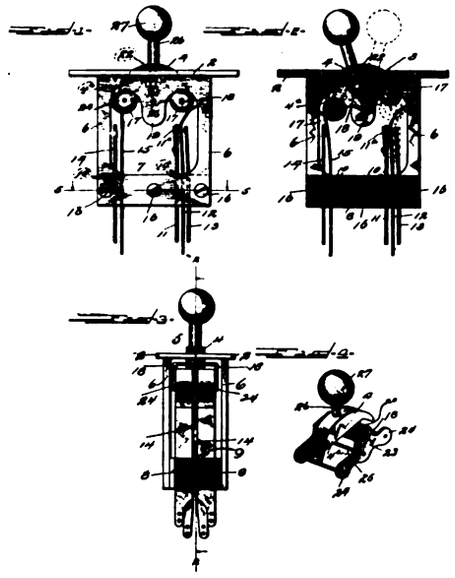
The inventors describe in this patent a combination of ratchet wheels, etc., to be operated by hand for the purpose of actuating selecting switches located at a central point in an intercommunicating system. Special arrangements of the ratchet mechanism to make it easy to operate and reliable in performance, together with an indicating device, form the basis of the patent.

OPERATOR'S KEY.

Albert Carliss, Chicago, Ill., patents (No. 836,668, dated Nov. 27, 1906; filed April 1, 1901; serial No. 53,776) an operator's key.

This patent covers a ringing and listening key with vertical springs. The top plate, 2, consists of a rectangular piece of metal provided with a central slot. Through this projects the segmental base 4, of key lever 5. This is adapted to vibrate to right or left, and maintain the closure of the slot in whatever position it may be placed. Side plates 6, extending from the lower side of plate 2, are provided with apertures at 7, to make a light construction and facilitate inspection or adjustment. Between these side plates are secured insulated pieces 8-8, separated by a thin insulating strip 9. These are clamped in place by screws 16, after switch springs have been inserted in slots 10. In each group one spring, which is flexible, projects above the others and into the path of the insulating rollers 17.

These rollers are mounted upon the tilting frame 18. This tilting frame may be made of a sheet-brass punching, and secured to the lower edge of the segmental lever base 4, by a bolt 22, an

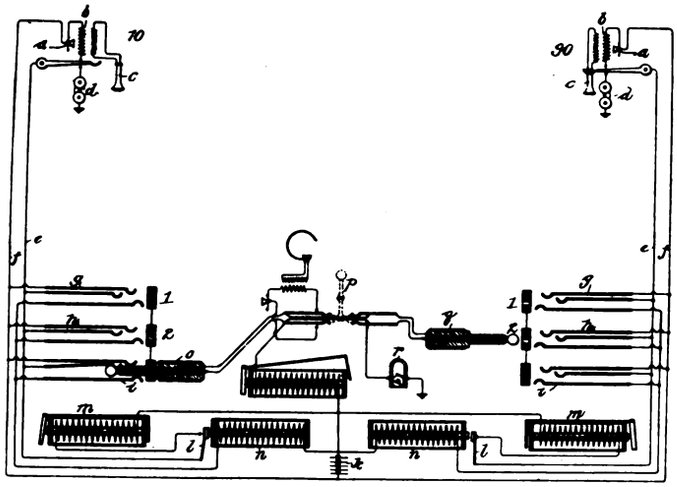


extension of which serves as a handle. Pivot 25, in the tilting frame, engages openings in the frame 6. When the key is thrown to the left, springs 15 press upon the rollers in such a way as to hold the key in its thrown position; that is, they exert their pressure at a point above the line joining the axis of the roller and the pivot 25; but as soon as the key is started back to its normal position the force of the spring facilitates its return. Other springs 12, used for ringing, are so formed as to at all times return the key lever to its normal position.

The vertical arrangement of springs enables the mechanism of the key to be compressed into a space having small horizontal dimensions.

TELEPHONE EXCHANGE SYSTEM.

W. M. Davis, Seattle, Wash., patents (No. 12,560; dated November 20th, 1906; original No. 679,731, dated August 6th, 1901; application for reissue filed October 30th, 1903; serial No. 179,243) and assigns by mesne assignments to the Stromberg-Carlson Telephone Manufacturing Company, Rochester, N. Y., a telephone exchange system.



The invention covered by this patent consists in the arrangement of the line signal controlling relay in connection with specially constructed jacks, as shown in the illustration. When a subscriber removes his telephone from the hook the magnetic signal *m* is actuated through contact *l*, which is normally closed. The insertion of the plug causes the jack spring associated with line wire *f* to be connected through a metallic ring in the plug to spring *i*. It will be seen that this completes a circuit through relay *n*, which on the attraction of its armature breaks the circuit through line signal *m*, allowing its restoration to the inoperative position.

TELEPHONE BRACKET.

Charles H. Borden, Stamford, Conn., patents (No. 834,104; dated October 23, 1906; filed August 29, 1905; serial No. 276,249), a telephone bracket.

The inventor describes a telephone bracket of the type in which two parallel arms, pivoted at the ends, are fastened to a wall or desk bracket and to a support for the instrument so as to allow of vertical and horizontal movement and at the same time retain the telephone in a vertical position. A pair of spiral springs, mounted on the base support of the arm, are used to balance the weight of the telephone. In order to counteract the increased tension of the springs when the bracket is depressed, a cam-faced nut is provided at one of the joints. The inventor intends that the action of this nut shall perfect the balance of the arm.

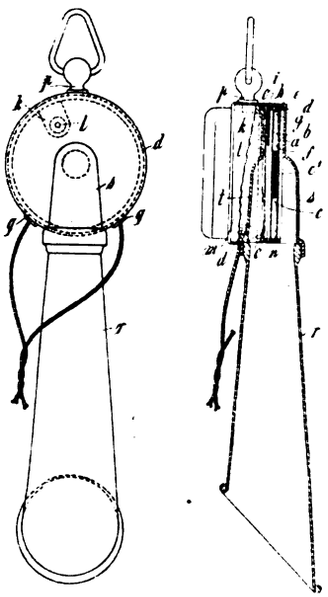
MICRO-TELEPHONE.

Arvid Andersson Lind, Malmo, Sweden, patents (No. 835,860, dated Nov. 13, 1906; filed Feb. 28, 1905; serial No. 247,792) a hand micro-telephone.

The object of this invention is stated to be to provide a transmitter which will not be subjected to air currents and reflected sound waves, which have a tendency to reduce clearness of transmitted speech.

The inventor has provided a micro-telephone in which the receiver is arranged in a special casing, *m*, which may be inserted into the casing *d*, which holds the transmitter. Into the transmitter case leads a hollow mouthpiece, *r*, which also serves as a handle. This opens directly into a recess in the case, formed by making a hollow swelling, *s*, in the back wall and a corresponding cavity, *t*, in the casing of the receiver. In the middle of this opening is mounted by a suitable mechanical arrangement a pair of transmitter diaphragms. The carbon grains, c^1 are con-



tained between the two diaphragms, and the sound waves simultaneously impinge upon both diaphragms, causing them to approach each other or become more widely separated, thus varying the resistance through the granules c^1.

The inventor states that the effect of ordinary air currents, and local sound waves due to reflection, is likely to cause both diaphragms to swing together in one direction or the other, so that these vibrations produce no effect upon transmission.

Peculiarities of construction which will be evident from a careful examination of the drawing are mentioned in the description.

ELECTRIC ALARM.

E. S. Moorer, Anderson, S. C., patents (No. 837,097; dated November 27, 1906; filed September 16, 1905; serial No. 278,739) an electric alarm.

This patent covers an arrangement of apparatus and circuits, to be connected to a telephone line at a sub-station, for giving an alarm when disturbed by fire, the movements of a burglar, etc.

TELEPHONE ATTACHMENT.

Joseph Silverman, San Francisco, Cal., patents (No. 836,407; dated Nov. 20, 1906; filed March 5, 1906; serial No. 304,285) a telephone attachment.

The object of this invention is to provide a means for controlling the position of a switch hook in a telephone instrument of the ordinary type when the receiver is permanently held by some other auxiliary device. The supporting member is a standard which may be fastened to the case of the telephone near the switch hook. Pivoted at its central point to the standard is a cylindrical plate, to the periphery of which is attached a finger adapted to be laid across the switch hook and hold it forcibly in its lower position. The necessary power for holding the finger horizontally against the tension of the switch hook spring is supplied by a spiral spring attached respectively to the standard below the finger plate, and to a pin inserted in the finger plate near its periphery, and on a radius 45° above and towards the instrument from that of which the finger is a continuation. It will be seen that a slight motion imparted to the finger will cause its rotation far enough to carry the pivoted spring past the vertical or dead point, and that this spring will cause the continued rotation of the finger until further motion is prevented by a stop acting on a recess in the plate. This provides a simple mechanism for the purpose desired, which does not prevent the hook from being easily vibrated up and down.

SELECTING AND SIGNALING SYSTEM.

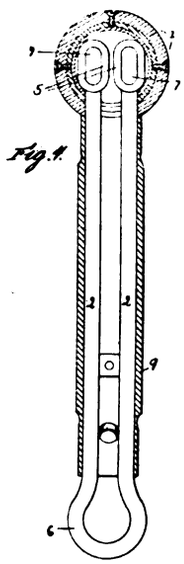
Robert J. Sheehy, New York, N. Y., patents (No. 831,687; dated Sept. 25, 1906; filed Oct. 9, 1902; serial No. 126,507) a selecting and signaling system.

The inventor provides for a step by step selective system, using alternating current and polarized relays. At each station there may be several forms of signal receiving apparatus, such as a Morse outfit, printing telegraph or a telephone instrument, any one of which may be connected to the line by the operator at the central station by means of the step by step mechanism, and it is thus evident that the invention relates more especially to railroad and municipal telegraph and signaling systems. He claims that the central office operator may select one or more of these stations on the line and connect them either with each other or with the central office, so that communication may be simultaneously had with all the stations on the line if it is desired.

HAND TELEPHONE.

Stephen C. Hougton and Frank M. Potter, Jr., Syracuse, N. Y., patent (No. 837,470; dated December 4th, 1906; filed October 5th, 1905; serial No. 281,381) and assign to the Wire and Telephone Company of America, Rome, N. Y., a hand telephone.

This patent covers the long magnet hand telephone structure manufactured by the Wire and Telephone Company of America. In the illustration is shown a long permanent horseshoe magnet 2, which supports at its extremeties the receiver and transmitter; 1 represents the receiver, having electro magnets (5), the cores of which (7) extend into engagement with the permanent magnet



to the poles of which they are secured by pins. The circularly formed heel (6) of the permanent magnet embraces the shell of the transmitter, providing for it a rigid support. A shell of suitable insulating material is molded about the lower portion of the long magnet and forms a handle for the instrument, and this also conceals the connecting cords which extend from one end to the other between the limbs of the magnet.

IN THE MANUFACTURING FIELD

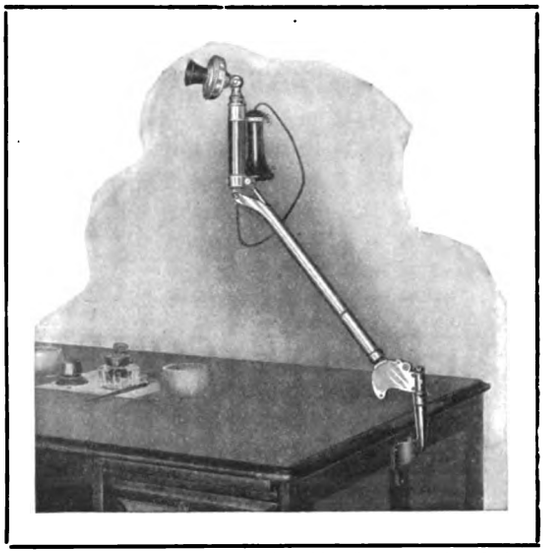
"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

A NEW TELEPHONE ARM.

AS a device for adjusting the telephone to a large variety of positions to suit the convenience of the user the Oliver Manufacturing Company, of Philadelphia, Pa., has been able to present in the "Flexiphone" an instrument not only novel in general form, but embodying constructive features of unusual merit. This success is undoubtedly largely due in a measure to the earnest co-operation of the Holtzer-Cabot Electric Company, of Brookline, Mass., which will participate with the Oliver Manufacturing Company in the manufacture and general sale of the "Flexiphone" in the United States as special licensees.

The instrument offers ample evidence of the presence of new ideas, unhampered and untrammelled by the conventions and ruts of "the way we used to do it."

The arm, as it appears in use, is shown in an illustration on this page. The attaching device is provided with an angle head, adapting it to any kind of a flat top or roll top desk, to the wall or in almost any conceivable position. The adjustable arm is of cold rolled steel with a handsome hard rubber finish, trimmed in full nickel; the arm is carried by, and longitudinally slides on, an inner supporting rod; a double cam at the base imparts just sufficient end-wise motion to the tubular arm to maintain the pedestal portion always in an upright position during the vertical swing of the arm, which also has a horizontal movement on the supporting stud of the desk attachment.

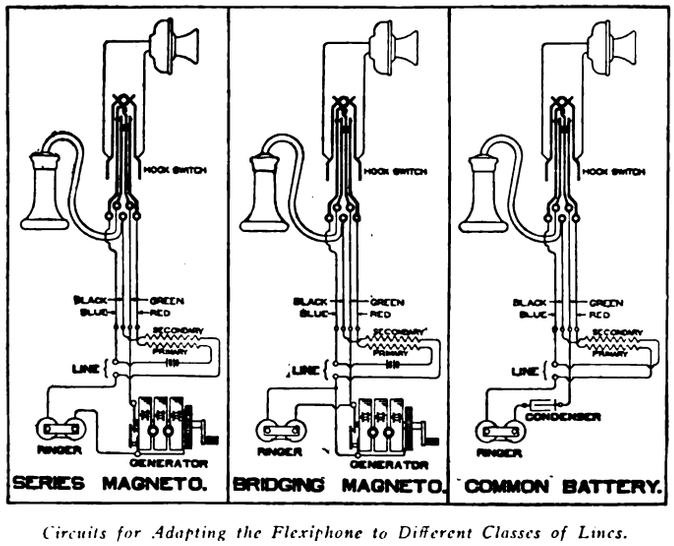


The Flexiphone, a New Adjustable Support, Attached to Desk.

A unique and convenient feature of this invention is the revolving head, carried on a hollow vertical stud at the upper end of the pedestal. This head supports the transmitter and permits it to rotate through an arc of two-thirds of the circumference of a circle in a horizontal plane, making the mouthpiece accessible at either side or in front of the arm. It always faces you. This rotative movement of the transmitter, together with the horizontal and vertical swinging of the adjustable "self-balancing" arm, makes this in fact a flexible telephone support; hence its name, the "Flexiphone." This one instrument may be used as a desk or a wall telephone and yet is without certain faults which impair the usefulness of both these types, such as the risk of fallen and broken instruments, tangled or broken cords, etc.

Some interesting results were produced by the Holtzer-Cabot company in the design of the parts that interest the telephone inspector or trouble man. Remove one screw near the head of the pedestal and the transmitter and transmitter switch springs and switch hook lift from the upper casing, all self-contained. The outer casing may now be removed, the transmitter head put back in position and the instrument stands as a complete operative telephone in which all spring contacts, cord connections, etc., are in full view, easily and instantly accessible. These cord connections are made to terminals fitted on a hard rubber block securely fastened to the frame on which the switch springs are mounted. Hard rubber is the only insulating material used. The contact springs are of german silver with pure platinum points, which when assembled by the inspector make long sliding contacts, keeping points clean and bright. These contact springs rest against stops under tension and, the hook lever being independently supported and operated by an auxiliary steel spring, the full elasticity of the contact springs is used in making perfect contacts. This switch hook acts directly on the contact springs and has no lost motion.

With the exception of the two platinum contacts of the switch springs, there are no unsoldered contacts between the desk terminals and the transmitter. This will be instantly appreciated by the practical telephone man. The "Flexiphone" will be supplied to the trade equipped for common battery, series or bridging magneto circuits, as indicated in the accompanying diagrams. This new telephone during the Electrical Trades Exposition in Chicago, January 14 to 26, will be exhibited in space 1, section E. Full information can also be obtained by writing to the company.



Circuits for Adapting the Flexiphone to Different Classes of Lines.

THE AMERICAN CONDUIT COMPANY reports so rapid and healthy a growth in its business that it has found it necessary to get larger quarters and has moved its New York office from 170 Broadway to 140 Nassau street.

THE SWEDISH-AMERICAN TELEPHONE COMPANY, Chicago, Ill., will be represented at the Chicago Electrical Show. Its space is No. 12, Section E, at which point telephone men are invited to gather.

THE COMMERCIAL ELECTRICAL SUPPLY COMPANY, St. Louis, Mo., announces the sale of a number of Vote-Berger telephones to the Western Union Telegraph Company to replace Bell instruments, which have been in use on the Western Union company's private lines from St. Louis to Kansas City and vicinity. These instruments were sold only after a careful and thorough test by the engineering department of the Western Union Telegraph Company.

The agency for our products which has since 1897 been in the hands of Messrs. Smith & Hemenway Co., New York City, has been by mutual agreement, discontinued.

Such parts as may be required by users of our apparatus will from this date be supplied by the L. M. Ericsson Tel. Mfg. Co., Buffalo, N. Y., which company will be our only representative in the United States.

They will place on the market telephone and electrical apparatus of the same high standard which has characterized our products for the past thirty years.

We solicit for the Buffalo factory the kind consideration of the Independent Telephone Public and the opportunity to figure on its requirements.

Stockholm, December 1, 1906.
A.-B. L. M. ERICSSON & CO.
Axel Bostrom, Genl. Manager.

296 Broadway, New York,
December 1, 1906.

From and after this date the agency for the L. M. Ericsson & Co., Stockholm, Sweden, which has been in our hands since 1897, has been by mutual consent discontinued, and the business will be turned over to the L. M Ericsson Tel. Mfg. Co., Buffalo, N. Y.

To our many friends and customers we extend our heartiest thanks for their patronage and solicit a continuance of their favors for the L. M. Ericsson Tel. Mfg. Co., of Buffalo, N. Y., whenever they are in the market for telephone goods.

Very truly yours,
SMITH & HEMENWAY CO.,
J. F. Hemenway, Treas.
ERICSSON TELEPHONE CO.,
J. F. Hemenway, Treas.

Since the agency for A.-B. L. M. Ericsson & Co., Stockholm, Sweden, which has up to this date, been in the hands of Messrs. Smith & Hemenway Co., New York City, has been discontinued, we shall be pleased to supply to users of the L. M. Ericsson & Co.'s apparatus such parts as may be required.

We have organized an American Company, and built at Buffalo, N. Y., a large modern factory for the manufacture of a superior grade of telephone and electrical apparatus.

With suitable modifications in the construction of our apparatus, so as to conform with the American standards, we will use our own especially designed and patented devices, and will aim to maintain the same high grade of workmanship by which the Stockholm products have been recognized for three decades.

Our policy will be strictly independent. We have no connection with or interest in any Telephone Manufacturing concern in the United States, claiming or representing by misleading names and statements, to be associated with or related to us and the Stockholm House.

With the assurance that every customer will receive from our hands a "square deal," we beg to be included in the kind consideration of the Independent Telephone Public.

Buffalo, N. Y., Dec. 1, 1906.

THE WEEK'S MESSAGES

NEW COMPANIES.

CRIPPLE CREEK, COL.—Articles of incorporation have been filed by the Crescent Telephone Company, with a capitalization of $5,000. The company proposes to construct and operate telephone lines between Cripple Creek, Divide and Florissant, and eventually to connect with points in Douglas, Park and Jefferson counties. The officers are: James D. Husted, president; Raymond Husted, vice president, secretary and treasurer; Joseph G. Long, general superintendent.

YAMPA, COL.—At a meeting recently held at Yampa, it was decided to organize an Independent telephone company, to be known as the Routt County Mutual Telephone Company. It is expected that this organization will take in all the mutual companies in the neighborhood of Yampa, Huggins, Pinnacle, Dunkley and Eddy, and possibly Hayden and Craig.

PALOMA, ILL.—The Paloma Telephone Company has been organized for the purpose of constructing and maintaining a telephone system in Paloma. Lines will also be built into the surrounding country.

ROCKWOOD, ILL.—The Ebenezer Telephone Company, Rockwood, Ill., has been incorporated with a capital stock of $500. The incorporators are Wilbur H. Morgan, Joseph M. Vickers and Lewis Harry.

PALMYRA, IND.—The Farmers' Metropolitan Telephone Company has been incorporated with a capital stock of $500. Among the incorporators are Lee Langford, Charles Ems and E. K. Hines.

DODGE CITY. KAN.—The organization of the Arkansas Valley Telephone Company has been practically completed. It has a working capital of $60,000, and the stockholders are business men in central and western Kansas. The company's lines will connect towns along the Atchiso, Topeka & Santa Fe as far west as Garden City, with eastern jobbing centers.

M'DONALD, KAN.—Articles of incorporation have been filed by the McDonald Telephone Compa.y of McDonald.

MAYWOOD, NEB.—Articles of incorporation have been filed by the Farmers' Co-operative Telephone Company, and the following officers have been elected: A. C. Barry, president, and H. H. Cleveland, secretary. The capital stock is given at $1,500.

RALEIGH, N. C.—The Capital City Telephone Company has been incorporated at Raleigh.

OKARCHE, OKLA.—The Hoebing Telephone Company, of Okarche, has been incorporated with a capital stock of $6,000. The incorporators are T. F. Hanson, John W. Thiems, of Calumet; John Hoebing, Mat Wiemel, G. D. Lovell, Henry Frederick and Charles Thiems, of Okarche.

SHERWOOD, ORE.—The Sherwood Mutual Telephone Company, with principal offices at Sherwood, has been incorporated with the following incorporators: J P. Young, L. S. McConnell and F. Langer.

SPOTTSYLVANIA, VA.—The Spottsylvania Telephone Company has been incorporated at Spottsylvania with a capital stock of $10,000. It is its intention to construct telephone lines in Spottsylvania and adjoining counties. The incorporators are G. W. Perry, J. P. H. Crismond, T. A. Harris T. W. Dew, W. B. Warren, C. R. Coleman, W. G. Dillard, N. L. Mills and A. H. Crismond.

WOODLAND, WASH.—Articles of incorporation have been filed by the Lewis River Independent Telephone Company, of Woodland. The new company has an authorized capital of $5,000, and the incorporators are R. D. Lawson, J. S. Fields and J. W. Strong.

MATEHUALA, MEX.—An Independent telephone company has been incorporated in Matehuala, State of San Luis Potosi, under the name of Benito Juarez. It is its intention to build lines in the city of Matehuala.

FRANCHISES.

HERRIN, ILL.—The Farmers' League Telephone Association, which operates in all the principal towns in Union and Jackson counties, and a part of Johnston and Williamson, has applied for a franchise to build lines in Herrin.

LA HARPE, ILL.—The city council has granted a franchise to the Farmers' Mutual Telephone Company to install and operate an exchange in La Harpe.

ST. JOSEPH, MICH.—The Lake Shore Telephone Company, which was recently granted a franchise by the city council of Benton Harbor, has made application for a similar franchise at St. Joseph, Mich.

MONTROSE, PA.—The town council has granted a franchise to the Northeastern Telephone Company to construct lines and establish an exchange at Montrose.

DEEP CREEK, WASH.—Application for a franchise to construct lines in the direction of Medical Lake has been made by the Deep Creek Telephone Company.

FINANCIAL.

ABINGDON, ILL.—The Mutual Union Telephone Company has increased its capital stock from $10,000 to $15,000.

HILLSBORO, ILL.—The capital stock of the People's Mutual Telephone Company has been increased from $10,000 to $15,000.

PARIS, ILL.—The Indiana Telegraph & Telephone Company, of Dana, Ill., has filed a trust deed to secure a bond issue of $50,000, made to the Mercantile Bond & Trust Company of Chicago. The Dana line connects with the local telephone system at Chrisman, and the object of the bond issue is understood to be the general improvement of the system.

CLEVELAND, OHIO.—The Cuyahoga Telephone Company has declared a divident of 1½ per cent on its preferred stock, for the quarter ending December 31, 1906, payable February 1, 1907, to all stockholders on record January 20, 1907. The common stock dividend of 1 per cent was also declared, payable January 20, 1907, to all stockholders on record January 12, 1907.

COLUMBUS, OHIO.—At a meeting of the board of directors of the Columbus Citizens' Telephone Company, the regular quarterly dividend of 1½ per cent was declared on the capital stock of the company, payable January 1; and the regularly quarterly dividend of 1¼ per cent on the stock of the Franklin County Telephone Company, payable on the same date.

MONROE, WIS.—The directors of the Monroe Telephone Company have declared a dividend of three per cent on the earnings of the past six months, payable February 1, 1907.

COMBINATIONS.

LEESBURG, IND.—The Wilmot Telephone Company, of Cromwell, has been acquired by J. E. Armstrong, of Leesburg, and it is the intention of the new manager to make many improvements in the plant.

RISING SUN, IND.—The farmers of Ohio and Switzerland counties have united their lines and will run a trunk line to Rising Sun.

MOOSE LAKE, MINN.—The Consolidated Telephone Company has acquired the Moose Lake Telephone Company's system both at Moose Lake and Barnum.

PURDY, MO.—The Purdy Telephone Company and the Enterprise Telephone Company have formed a merger, and stock certificates will be issued by the Purdy Company.

ELECTIONS.

COLUSA, CAL.—The Colusa County Telephone Company has elected the following officers: C. L. Schaad, president; W. T. Rathburn, vice president; J. Morris Jones, secretary; Bank of Williams, treasurer; directors, C. L. Schaad, George C. Comstock, W. T. Rathbun, J. F. Campbell and Oscar Robinson.

THE WEEK'S MESSAGES

H. Appleby; directors, G. W. Appleby, A. H. Appleby, Thomas Crane, J. H. Wright, D. D. Dorn, A. J. Peterson and F. J. Davis. The company's office is at Watts Flatts, and its exchange at Kennedy.

BLOOMINGVILLE, OHIO.—At a recent meeting of the Bloomingville Telephone Company the following officers were elected: F. P. Schnee, president; H. F. Byington, manager; J. V. Ramsdell, secretary.

BELLINGHAM, WASH.—The Farmers' Mutual Telephone Company has elected the following directors: E. Brown, Custer; W. L. Galbraith, Lynden; P. D. Harkness, Everson; James Baily, Nooksack; L. W. Norton, Blaine; J. N. Miller, Ferndale; L. G. Van Valkenberg, Sumas. Mr. Brown was re-elected president.

LIVINGSTON, WIS.—The Grant County Telephone Company has elected the following officers and directors: President, Fred Biddick; vice president, Henry Kemper; secretary and treasurer, Ira W. Griswold; directors, Stephen Dennis, C. A. Iverson, George Bickford, Henry Kraemer, John Thompson, James Harris, Carl Reichert, Fred Weinbrenner, William Martin, Joseph Griswold, Frank Smith and W. C. Livingston.

PERSONAL.

FRANK BRACELIN, Jr., has recently taken charge of the Northwestern Telephone Exchange Company's office at St. Cloud, Minn.

ARTHUR E. CALDWELL has been promoted to the position of district wire chief of the Sunset Telephone Company, with headquarters at San Jose, Cal.

A. D. EVANS has been made district fire chief, with headquarters at Janesville, Wis., by the Wisconsin Telephone Company.

M. T. GOODMAN has been elected manager of the Home Telephone Company at Clarksville, Texas.

JAMES W. HOWATT, who for the past two years has been manager of the St. Cloud exchange of the Northwestern Telephone Company, has been promoted to the position of superintendent of the district having its headquarters at Wadena, Minn.

G. V. REID, of Moosejaw, Saskatchewan, has accepted the position of superintendent of telephone and electric light plants at Kenora, Ontario.

DAN TAFT has resigned from the telegraph department of the Pennsylvania Railway to accept a position with the Greene County Telephone Co. at Waynesburg, Pa.

MISCELLANEOUS.

ARMADA, MICH.—Because of a proposed increase in rates by the Michigan State Telephone Company (Bell) the business men of Armada and over one hundred farmers are endeavoring to make arrangements with the Independent Company and sever their connections with the Bell Company.

BRADSHAW, NEB.—The Bradshaw Telephone Company is moving its Arborville central office to Polk.

HAVANA, O.—The incorporators of the recently organized Havana Telephone Company are Geo. G. Van Horn and others, and the capital stock is placed at $5,000.

WARRENTON, VA.—The plant of the Warrenton Telephone Company has been purchased by Paul C. Richards, and it is the new owner's intention to make many improvements and extensions in the system.

FREDERICK, MD.—The Frederick County Telephone and Telegraph Company has arranged for a connection with the Loudoun County (Va.) Telephone Company.

HEREFORD, TEXAS.—The Hereford Telephone Company has passed into the possession of Claude J. Blain and others of Trenton, Mo.

SPOKANE, WASH.—The Home Telephone Company is to have long distance connections between Spokane and the Pacific Coast points, arrangements having been made with the Puget Sound Telephone Company, by which the Spokane branch will be connected with points on coast from Seattle to San Francisco.

BETHEL, VT.—The Strafford Telephone Company, of which W. A. Perkins is an active director, is a rapidly growing Independent telephone company. It now has three hundred and fifty subscribers, and through arrangements with other connecting companies is enabled to give a free exchange of service with central offices hteing a total of 6,000 telephones.

GUELPH, ONT., CAN.—The Stark Telephone & Power Company of Toronto has offered to render all the assistance in its power towards the establishment of a municipal telephone system at Guelph.

New Construction in the Field

CENTRAL VILLAGE, CONN.—The Consolidated Railroad Company is considering the advisability of installing telephones at each switch along its line between Central Village and Webster for the purpose of directing the movements of its cars.

BONDVILLE, ILL.—New lines are being constructed by the Bondville Telephone Company.

KEWANEE, ILL.—Many improvements are being made in the lines of the Kewanee Home Telephone Company.

GEORGETOWN, IND.—It is the intention of the Independent Long Distance Telephone Company to establish an exchange at Georgetown.

CEDAR RAPIDS, IOWA.—The Cedar Rapids & Marion Telephone Company expects to rebuild its local exchange at a cost of about $40,000.

PIKEVILLE, KY.—The Eastern Kentucky Home Telephone Company has built a line from Pikeville, Ky., via Elkhorn City, to Clintwood, Va., giving direct communication with Wise, Morton, Coebum, Big Stone Gap, Stonega, Bristol and Knoxville, Tenn., and Whitesburg, Ky. Long distance connections will be established at Bristol, Knoxville and Big Stone Gap.

BATTLE CREEK, MICH.—The Citizens Telephone Company contemplates the erection of new lines in Battle Creek.

HONOR, MICH.—The lines of the Benzie County Telephone Company are being extended in Honor.

PINCONNING, MICH.—The Northeastern Telephone Company contemplates making many extensions in its system. A line will be erected at once from Pinconning to Crump, and later lines will be built to Mt. Forest, Rhodes, Bertie, Whitefeather, Worth and Gladwin.

SPRINGFIELD, MINN.—To take care of its rapidly increasing business, the Farmers Citizens Mutual Telephone Company expects to install a new switchboard at Springfield.

SPRINGFIELD, MO.—Construction work on the Springfield Home Telephone Company's plant is being carried on rapidly, and it is estimated that the exchange will be in operation by June 1, 1907.

GREAT FALLS, MONT.—The Independent Telephone Company of Butte, which secured a franchise at Great Falls some time ago, is to commence the construction of its system. It is the company's intention to install a thoroughly up-to-date plant at Great Falls, and to effect connections between that city and Butte, Anaconda, Helena and other cities. It is estimated that about $1,500,000 will be spent in these improvements.

BLUE HILL, NEB.—The Glenwood Telephone Company is considering the advisability of installing a new switchboard.

VALATIE, N. Y.—The Valatie Telephone Company, which has recently installed a new switchboard to take care of its increased business, expects to make other improvements in its system.

COLUMBUS, OHIO.—The police department is considering the advisability of expending $15,000 on a new telephone system.

MINERVA, OHIO.—New lines are being strung by the Minerva Telephone Company.

GROVE CITY, PA.—New lines are being built by the Mercer County Telephone Company at Grove City.

HUDSON, PA.—Additional lines are being built by the Standard Telephone Company at Hudson.

MT. PENN, PA.—The Consolidated Telephone Company is constructing a line through Mt. Penn.

PENNSVILLE, PA.—Lines to Pennsville are being built by the Tri-State Telephone Company.

WHITE HORSE, S. D.—A telephone line is to be constructed from the Cheyenne River agency to the subagencies at White Horse and Cherry Creek.

JONESBORO, TENN.—The Home Telephone Company is at work on its system at Jonesboro.

EUREKA, UTAH.—A new central office is to be opened by the Utah Independent Telephone Company at Eureka. It is the company's intention to extend its lines to other points in the near future.

BELLINGHAM, WASH.—The Farmers' Mutual Telephone Company is constructing a line to Lynden. It also contemplates the erection of a line from Ferndale to Laurel and Shettlers Corners, and also one to Maple Falls.

COLVILLE, WASH.—A farmers" telephone line has been built from Colville to Echo, and an exchange will be established at the latter city.

BRIDGEPORT, W. VA.—Additional wires are being strung between Bridgeport and Bellaire by the Belmont Telephone Company.

WHEELING, WEST VA.—It is the intention of the National Telephone Company to install new equipment in its new offices.

AMHERST, WIS.—The Amherst Mutual Telephone Company is extending its lines from Amherst to Custer via Fancher.

WINNIPEG, MANITOBA, CAN.—The Manitoba Cabinet has called for tenders for the construction of one thousand miles of telephone lines in this province, under the mandate authorizing public ownership of the system. The contract will involve the expenditure of several millions of dollars, and the funds will be provided through 20-year debentures.

20 Pair Bank No. 10.

Cook's No. 10 Protector

COOK'S No. 10 Protector is so radically different in principle and design from previously existing types of switchboard protective apparatus, and has so many vital points of improvement, that from an engineering standpoint, it belongs in a class by itself. The following features alone are enough to recommend it to every careful, conservative, conscientious telephone engineer:

1. *The heat coil is not made of wire; it cannot burn out or short circuit.*
2. *There are no loose contacts in the circuit.*
3. *There cannot be a defective coil in the circuit.*
4. *The springs of each pair are separated and insulated from all adjacent springs.*
5. *No bolt connections are used to transpose the line and the switchboard terminals; consequently there can be no loose connection in the circuit.*

Cook's No. 10 Protector is a resoldering but not a self-soldering protector.

It is mechanically and electrically simpler and better than *any* protector on the market.

Write for descriptive bulletin and prices.

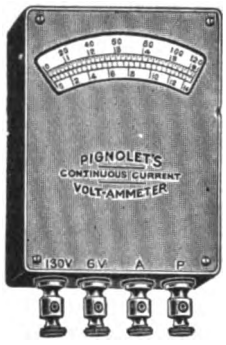
LOOKING FOR TROUBLE?



Suppose you have a line in trouble—grounded or open. You don't know the exact location, but you send out a troubleman to hunt it up and clear it. It may take him an hour or a day. Meanwhile the subscriber is getting hot under the collar and saying things about telephones in general and yours in particular.

If you have a Pignolet voltmeter or volt-ammeter you can determine the approximate location and also get an idea of the nature of the trouble. With the information your troubleman can find the fault in jig time, and you will have prevented the subscriber kicking by giving him service at the earliest possible moment.

Does it pay to be informed? You ought to know.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit

78 CORTLANDT ST., N. Y.

MICHIGAN WHITE CEDAR POLES

In addition to the several yards we have had in the past, we wish to call your attention to our new yard which is located at Escanaba, Mich.

The acquisition of this new yard enables us to ship poles by all railroads or by the lake routes, thereby enabling us to give the best delivered prices.

The location of our new yard makes it easier to secure cars, thus facilitating prompt shipment.

In many cases poles can be shipped by car-ferry, making possible a great saving in cases of shipment to Eastern points.

We are wholesalers exclusively, shipping in car lots only.

Write us for delivered prices and "Pole Booklet No. 3-A." Yours for the asking.

JUST A SUGGESTION

Take one of your busy 4-party lines and equip it with "POOLE" Lock-Outs. Leave it in service a month and then see how many of the four will stand a raise of $3.00 a year rather than go back to the old way. We know the answer, but we want your subscribers to impress on you the fact that the "POOLE" Lock-Out is a rate-raiser.

It won't cost you anything to try it, because we will loan you the Lock-Outs free and there is no other equipment required. Write today for our Booklet AL-2.

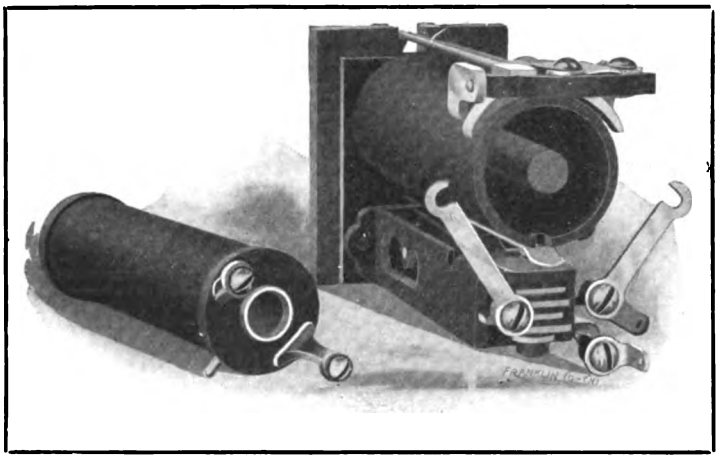
DEAN TELEPHONE APPARATUS

Our MAGNETO SWITCHBOARDS and APPARATUS embody many REFINEMENTS in design and construction such as—

The DROPS besides being self restoring are so designed that the coils may be easily and quickly removed without disturbing their magnetic circuits or mechanical adjustments.

The JACKS have platinum pointed contacts to cut off the drop windings from the line and are arranged so as to be removable from the front of the switchboard.



The NIGHT ALARM CONTACTS are also platinum pointed, mounted so as to be easily accessible for inspection from the front of the switchboard, and are provided with shields so as to be absolutely protected from injury through contact with the plug points.

In fact, all of our apparatus is of the same type of design and identical to that furnished on our largest multiple switchboard—a guarantee to you.

Our new folder No. 6, a copy of which will be mailed free on request, will give you many other interesting details.

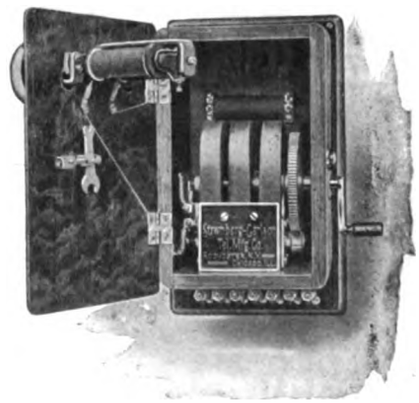
QUALITY—DURABILITY—EFFICIENCY

THESE features are essential, they assure good service and very materially increase the value of your investment. The Magneto forms a very important part in every Generator Call Telephone. The cuts shown herewith illustrate magnetos of the highest quality and greatest efficiency; they are most powerful and will successfully ring the telephones on the longest lines with the greatest number of instruments installed. Existing conditions have been carefully considered and great care and attention have been given to construction and design, with the result that our 5-bar Bridging Generator will ring over a line offering 100,000 ohms, which is much greater than the heaviest loaded rural party line.

Powerful 5-bar Bridging Generator.

Generator and Extension Bell.

Hand Generator mounted in Oak or Walnut Woodwork.



Generator and Extension Bell Open.

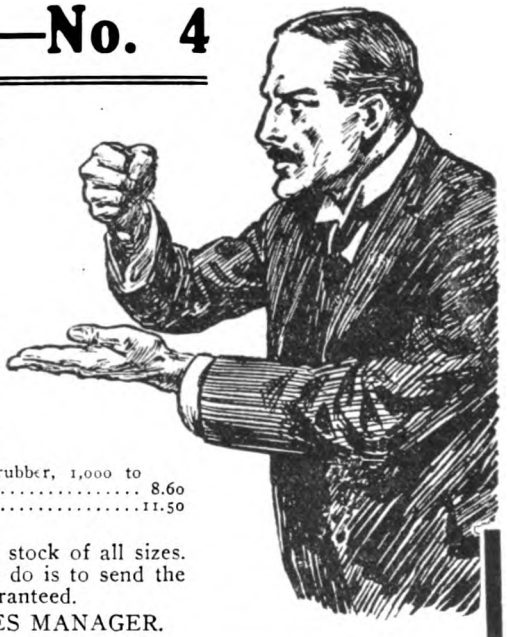
LITTLE THINGS THAT COUNT

The sleeve of the plug is loose, thus saving wear on cords. The tip connection is made within the body by a screw clamping the tip conductor of the cord. Rubber insulation makes short circuits impossible. The sleeve connection is made by turning back the sleeve conductor of the cord and screwing the end into the plug. The thread at this end is deep and coarse, making a strong perfect connection. Our catalogue describes this plug.

MONARCH TELEPHONE MFG. COMPANY, CHICAGO U. S. A.

Talks With The Buyer—No. 4



The number of answers that I received to my last talk, asking for free samples of our Ajax battery with which to make test, encourages me greatly, answers having come from great distances. The Ajax battery offer is still open; read my last talk. Now I want to call your attention to our especially attractive prices on

Rubber Covered Telephone Wires

By the placing of contract for an enormous quantity we were enabled to secure, before the advances, a particularly attractive price, of which we are giving the benefit to our customers. Prices will talk better than words. Here are a few:

No. 532, No. 19 gauge single conductor plain rubber, no braid, lots of 1,000 to 5,000 ft., per M.....$3.25
No. 533, No. 19 gauge single conductor saturated braid, 5/64 rubber, 1,000 to 5,000 ft., per M..... 4.25
No. 18, 3/32, 1,000 to 5,000 ft..... 5.55
No. 534, No. 19 gauge rubber conductor, 5/64 plain rubber insulation, no braid, one red, one black, 1,000 to 5,000 ft., per M..... 6.50
No. 538, No. 19 gauge double conductor, braided, one conductor with tracer, 5/64 rubber, 1,000 to 5,000 ft., per M..... 8.60
No. 18 gauge, 3/32 insulation, otherwise same as above.....11.50
No. 539, same as No. 538 except saturated braid for outside use; same prices.

The wire is highest quality. We carry an enormous and well assorted stock of all sizes. I don't need to talk very much about wire at such prices. All you have to do is to send the orders in. Better do it now. Add the other goods you need—prices guaranteed.

Distribution Rack

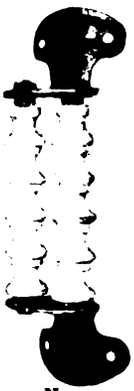
No. 1.

For Distributing from Pole-House or Can-Top Direct to Telephone.

No. 1 comes in 5 to 8 pair racks.

No. 2 comes in 10 to 16 pair racks.

Send for descriptive matter and prices.

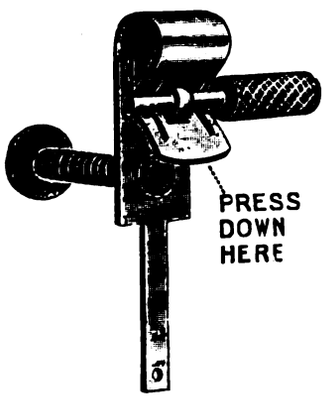


No. 2.

The W. G. Nagel Electric Co.

26-30 St. Clair St., TOLEDO, O.

A NECESSITY on distributing frames, dry batteries, and wherever permanent or temporary electrical connections are made THE No. 11 FAHNESTOCK SPRING BINDING POST was made to the special order of a large telephone company. It has an extra long lug and is well suited for use on distributing boards and other places about an exchange. Manufacturers of the leading dry batteries will supply their cells fitted with Fahnestock post without extra charge.



We carry a number of different styles in stock. Write for our new booklet. Special designs made to order.

FAHNESTOCK ELECTRIC CO.

129 Patchen Avenue Brooklyn, N. Y.

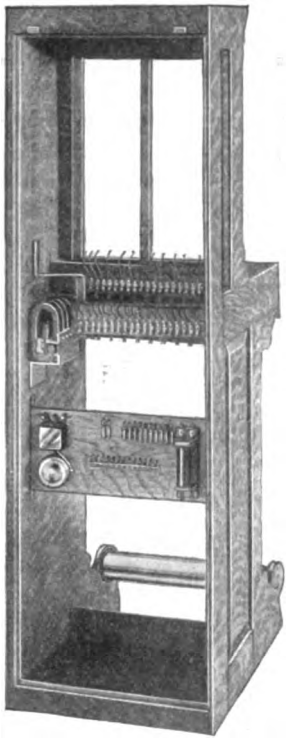
KELLOGG

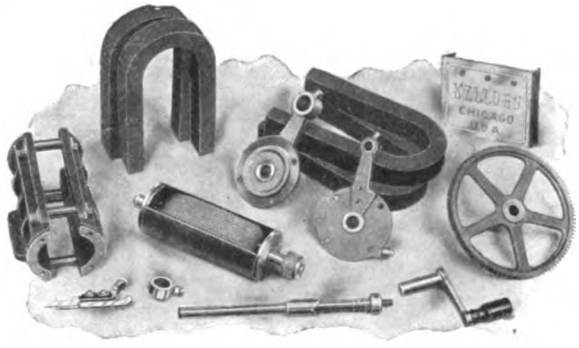
TELEPHONE APPARATUS



Magneto Switchboards

CONTAIN THE

KELLOGG HAND GENERATOR



The Kellogg generator is as nearly perfect, electrically and mechanically, as is possible to be made.

Our 4-bar generator has as great working power as any 5-bar generator of any other make.

THE ARMATURE has a shuttle-type core made from a special dense silicon iron, which is very soft and permeable. The steel shaft projections are attached to either end of the armature core by means of heavy brass discs, which accurately fit recesses turned in the end of the armature core, thereby insuring interchangeability and accurate running of the complete armature. This gives greater cross section of iron in the core proper, and larger winding space free from irregularities, than any other type.

THE WINDING is of best grade, silk-covered copper wire, wound smooth, without piling up at the ends. More iron is used and larger regular-shaped winding space is furnished, giving the armature better insulation, better insulation of winding, more output and greater durability than any other on the market.

THE TWO IRON POLE PIECES forming the frame and field of our generator are separated and securely fastened by four heavy brass posts, giving rigid construction, regardless of end plates, and allows poles to be bored out to gauge and always retain their relative positions.

THE END PLATES serve primarily as bearings for the running gear. They are most carefully and durably constructed, making it impossible for the armature to come off the centre and stick, even with the smallest clearance.

THE GEAR WHEELS are made from hard, tough brass in such a way that no matter how much worn the running is absolutely noiseless. The faces, are extra wide, cut with special shaped teeth.

THE FIELD MAGNETS are made of the best grade ½" x ¾" magnet steel, machine bent, uniformly tempered, copper-plated and oxidized. This is preferable to nickle, as the latter does not effectually prevent rusting the steel.

Note the generator is mounted in the rear of the board, with extension shaft, thus being out of the way of the operator's knees.

As our 4-bar generator will ring over most heavily loaded lines, we furnish same, unless our exceedingly powerful 5-bar generator is specified.

Write for "Bulletin No. 9A," which completely describes our Magneto Switchboards.

Sharpsville, Ind.,
Dec. 26, 1906.

Swedish-American Telephone Co.,
Chicago, Ill.

Gentlemen:

The 4 telephones recently shipped us have arrived and you are certainly to be complimented for making such superb instruments. The cabinets are fine and the wiring the finest I ever saw. Cutting the secondary and running the wires down for a condenser is a most happy thought. We will want some more soon.

Respectfully yours,
W. C. Turney,
Sharpsville Telephone Co.

You Wouldn't Start a Horse Car Line

in this age of electric cars? Not if you wanted to make money out of the business of transportation.

Then why should you start a manual telephone exchange in this age of automatics, if you want to make money out of the telephone business?

The automatic system of telephony bears the same relation to the manual system that the electric car does to the horse car. It is the apotheosis of telephone development, as the electric car is of transportation development.

The automatic telephone system produces the best service more economically than indifferent service can be produced with manual equipment.

There is no more question as to the relative popularity of the automatic and manual telephone service where the two kinds are in competition than there is as to the relative popularity of the trolley car and the horse car.

And, as for the securities—the same comparison may be applied with the same results.

Our Automatic system has been adopted in the following cities:

Aberdeen, S. D.
Akron, Ohio.

Save Yourself Trouble and Expense

By using Double Throw Switches for your first switchboard. After you have got your bearings and know about how many lines you have in service, you can substitute a regular switchboard and the switches will be available for other purposes. The best switch for the purpose is

A TRUMBULL ALL COPPER SWITCH

It makes positive connections and cannot get out of order. It is carefully made according to a new and exclusive design which overcomes all the troubles to which the ordinary switch is subject.

The switchboard employing these switches is the most economical form ever devised. It can be built and operated by a novice and is absolutely free from all troubles requiring technical knowledge for their solution. If you will drop us a line to show you are interested, we will send you full particulars and quote prices that will convince you this is the type of board you need for a start.

TRUMBULL ELECTRIC MFG. CO.

618 Woodford Ave., PLAINVILLE, CONN.

THE CALCULAGRAPH

Should be on every toll switchboard. Most large companies are using it and indorse it highly. Because it saves its cost in about six months and then keeps on making dividends.

It records the actual time a line is used.

IT MAKES NO CLERICAL ERRORS.

VOLUME XV. SATURDAY JANUARY 12, 1907. NUMBER 2

Drawing in the New York-New Haven Underground Cable

(Continued from the Issue of Jan. 5th.)

By John Putnam.

(Illustrations from Photographs by the Author.)

GUIDING the wire rope, one may see in Fig. 6 the upright, mentioned near the close of the first part of this article, as it appears when actually in use. This view shows the means adopted for controlling the speed of traction. Two separate shafts are used, one carrying the pulley and belt from the engine, the other carrying the windlass, one turning the other by means of gearing. A comparison of Figures 4 and 6 would reveal two separate gearing downs of the speed, once by belt and once by gear wheels proper. Rubber boots with long legs may be mentioned as incidental equipment very useful in these cross country manholes, as there are no sewers and they are, in the spring, very likely to contain water.

Fig. 6. The upright in place.

Figure 7 shows the whole scene at the drawing in end, the sleepy horses, the busy gasoline engine, the intent engineer, and the watchful man near the upright projecting from the manhole. Almost as rapidly as can be described, a section of cable is pulled in, the apparatus packed up and moved on to another manhole, and the same process repeated. A mile to a mile and a half of cable a day was pulled in by these means. Supposing the average length of the cable section to be 500 feet, then it would mean sixteen reels of cable a day drawn into the ducts or one every half hour. In the expressive language of the times, this is "going some."

In conclusion, it may interest the reader to look at a picture of a piece of cable as shown in Figure 8. The various familiar objects surrounding it are there to give an idea of its dimensions. The ordinary glass insulator is of about the same diameter, while the sample piece of cable is slightly over a foot long, as comparison with the two-foot rule on the wall will reveal. This cable is of the regular dry core type, paper insulation, with twisted pairs wound in reversed layers. It contains 112 pairs of copper wires, 37 pairs of No. 13 gauge B. & S. and 75 pairs of No. 16 gauge, the No. 13 wires being in the middle. In the picture on the wall at the right of the cable hangs a piece of No. 12 N. B. S. hard

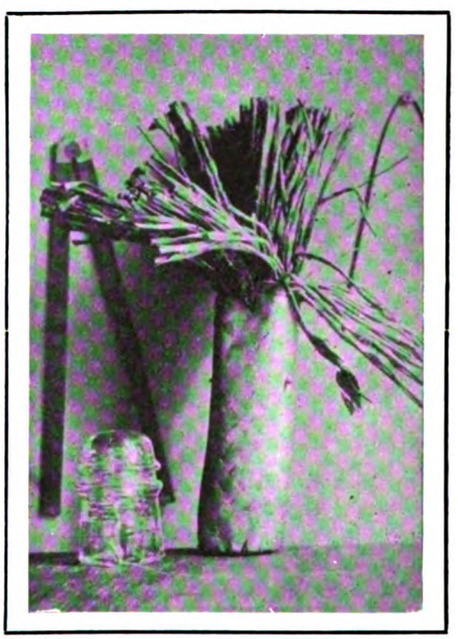

Fig 8. A sample of the New York-New Haven cable. Familiar objects show comparative size.

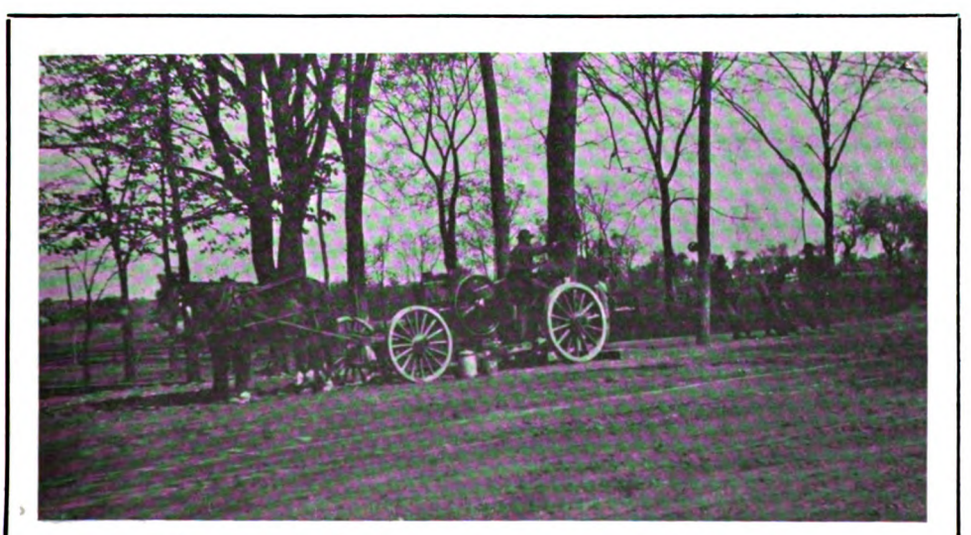

Fig. 7. The whole scene at the pulling end.

Digitized by Google

drawn copper line wire, and across it projects one of the No. 13 gauge cable conductors. In comparing the size of the two, care should be taken not to confuse the shadow cast by the No. 12 wire with the wire itself. It will then be realized that the No. 13 conductors of this cable are of pretty good size, especially when thought of in connection with the No. 22 gauge conductors of the ordinary short haul cable.

Such, then, is the method of pulling in cable by power generated in a gasoline motor. For the job in question, it was undoubtedly a very economical one, but for companies having a piece of cable to pull in now and then, it would hardly pay. In the latter case a good old horse hired from a neighboring livery stable or a couple of men of the husky variety, turning a windlass placed in a manhole, will continue to answer very well, and challenge all comers for economy, efficiency and adaptability to other pursuits when there is no cable to be pulled in.

Some European Telephone Statistics

THE figures given out by the departments having control of telegraph and telephone lines showing conditions at the end of the year 1904 have recently been made public by the governments of Hungary and Spain, and published by the *Journal Telegraphique*. These figures show that the development of these countries, as compared to corresponding areas in the United States, is very low; but the size of the systems is increasing with considerable rapidity. In Hungary the figures given out show that of exchanges in cities six were added during 1904, while the number of exchanges installed in small places brings the total number of new central offices up to 127, not counting the 16 small offices which do not form part of the government system. The total number of telephone stations in this country was during 1904 increased from 23,330 to 26,439, a total growth of 3,109 stations. This includes both pay stations and subscribers' stations. These figures are divided as follows for public telephones and ordinary subscribers' stations:

	Public Telephones.	Subscribers' Stations.
City	290	20,826
Interurban	9	11
Suburban	109	541
Departmental	705	3,038
For transmission of telegrams	17	....
	1,130	24,416

The number of telephone communications increased from 54,840,671 in 1903 to 63,319,263 in 1904, a gain of 8,472,592. In giving figures for long distance messages an interesting custom peculiar to this country is noted in the division of messages into "urgent" and "ordinary conversations." Of the former there were 28,058, while of the latter there were 727,495. In the same way local messages are divided into 61,946,956 transmitted between subscribers, and 108,034 transmitted between subscribers and pay stations. Of long distance international messages exchanged with Austria the numbers were as follows:

Urgent conversations outgoing	10,727
Urgent conversations incoming	10,977
Ordinary conversations outgoing	124,210
Ordinary conversations incoming	132,219

About eight thousand conversations coming under other classes also took place.

To Germany there were transmitted four urgent conversations and 931 ordinary; while of incoming messages from Germany there were received 37 urgent messages and 3,657 ordinary. It is said that the number of conversations for each person in Hungary was found to be 3.3, and the total revenue amount to Fr. 1,125,405 for conversations and Fr. 3,716.557 for subscriptions. The expense for maintenance of the lines includes that for keeping up the telegraph lines, and amounted to Fr. 1.833,909, with an additional amount of Fr. 56,682 for moving lines, etc.

In Spain the figures given out give a fair idea of the development throughout the country. At the end of the year 1904 the government operated eight systems in cities as follows: Cordova, Murcie, Mieres, Pola de Siero, Sama, Trubia, Leon and Escorial. The total number of subscribers for these eight exchanges was only 388, and the receipts amounted to 29,166 pesetas (a peseta being about one-fifth of a dollar). The trunk lines operated by the government brought in 25,094 pesetas. The total number of subscribers and pay stations in Spain at the end of 1904 is given as 18,575. A large number of telephone systems are operated by persons under concessions from the government, no less than 54 exchanges coming under this class. There are also 28 branch exchanges, and the number of subscribers connected to these systems is 15,594. The people holding these concessions pay to the city a tax of from 10% to 34% of the income from subscribers. In April, 1904, concessions were awarded for exchanges at Palamos and Martorel, subject to a royalty of 10% of the profit, which it is necessary to pay to the government. The following table will give an idea of the development of the principal exchanges, for which concessions were granted up to 1904:

Exchanges.	Number of subscribers.	Per cent. as revenue to State.	Price of subscriptions in pesetas.
Barcelona	3,010	33.75	180—300
Madrid	2,383	20.00	300
Bilbao	1,275	34.00	120—180
Valencia	1,097	31.50	250
Sabadell	439	22.50	125—240
Saragossa	419	20.00	100—360
Santander	396	12.00	90—500
St. Sebastien	333	21.00	180—300
S. Crux de Teneriffe	331	10.00	120—160
Toledo	294	16.00	90
Seville	265	10.00	200—300
Malaga	256	21.00	150—300
Valladolid	243	10.00	200—300
Carthagena	221	20.50	150—300
Grenada	217	10.00	150—500
Alicante	210	10.00	90—240
Las Palmas	171	12.00	200—300

Table Showing Number of Telephone Subscribers, etc., in Principal Cities of Spain.

The total receipts of the holders of these concessions in 1904 were 3,314,755 pesetas, of which the State took in taxes 809,081 pesetas. Besides the exchanges already mentioned there were at the end of the year 1904 seven telephone exchanges for official communications with 197 instruments connected with them; thirteen secondary telephone systems operating under special concessions; and 1,101 special lines carrying 2,234 stations, which yielded to the government a sum of 36,987 pesetas. In the northeastern part of Spain is a system under private control, which yields a revenue of 57,227 pesetas.

SUB-LICENSEE COMPANY IN PENNSYLVANIA DISCONTINUES CONNECTION WITH BELL LINES.

IN Edinboro, Pa., the Edinboro Telephone Company has for five years been connected with the lines of the Bell telephone company. At midnight January 1st the connection was severed, and the company which had formerly been operating under sub-license arrangements entered into an agreement for an exchange of service with the Union Telephone Company, of Erie, which is Independent. The Union Company has announced to its subscribers in Erie that conversation with Edinboro may now be carried on over direct copper metallic circuits belonging to the Independent company. This adds to the number of people available to the Erie company's subscribers the 210 people connected to the lines of the Edinboro company, which in turn derives the benefit due to its change to a strictly Independent condition.

Digitized by Google

Independent Telephone Development*

By James B. Hoge.

FEELING the hopelessless of fighting the Bell single-handed, some of the prominent men in the Independent movement invited representatives of all the known companies in the United States to come together in Detroit, Michigan, on June 22, 1897, for the purpose of forming an organization for mutual protection. This organization was effected, and a substantial sum subscribed to defray the expenses of fighting the patent cases through the Supreme Court of the United States, if necessary. One after another of these cases were carried through and won by the Independent interests.

Telephone apparatus at the time the patents expired in 1894 was very crude, the service was slow and transmission unsatisfactory. To supply the widespread demand for apparatus, Independent manufacturing companies started up almost immediately, improvements were made on the apparatus, competition between the different interests put all on their mettle, and more was accomplished between 1896 and 1900 in the way of improving the apparatus and service, and extending the use of the telephone than had been done in twenty years previous. After establishing themselves in the smaller cities, the Independents extended their lines out into the country, reaching all the post offices in a county; then the farmers began to organize companies and build, bringing their lines into the different post office centres where exchanges were installed, each county becoming a net work of wires. This service has been constantly increasing, finances for its development being in most cases furnished locally, until to-day there is over three hundred million dollars invested in Independent telephone properties, with more than three and a half million telephones installed and several hundred thousand miles of long distance toll lines connecting the different exchanges. The people in many of the larger cities, where the Bell was furnishing telephone service, were slow to appreciate the advantages to be derived from competition. They realized very often that they were paying more than their service was worth, and that there was a great deal of room for improvement in both the service and treatment, but dreaded to burden themselves with two telephones, "the double telephone nuisance," as the Bell taught them to consider it. In many cases where the citizens were willing, in fact anxious to have an Independent exchange installed, they were prevented through the Bell's control of their chosen representatives, who sometimes placed their own pecuniary gain above the welfare of the people they were elected to serve.

James B. Hoge, President of the International Independent Telephone Association.

Sometimes the Independent companies, in the early days, after obtaining franchises were unable to develop their property in the face of the greatly reduced rates, or even absolutely free service promptly offered by the Bell Company, and were forced to retire or sell out to the monopoly. Wherever this has happened, with scarcely an exception, another Independent company has been formed, proper provisions being made to prevent a like occurrence. An example may not be amiss. A few years ago an Independent plant was installed at Portland, Oregon, and forced the Bell to reduce its rates and improve service; it was not strong enough, however, to withstand the continued attacks of the Bell company, backed by other corporations and political power in control, and finally sold out; rates were at once raised and service became unsatisfactory from an operating standpoint. On December 7, 1904, an application for another Independent franchise was presented, and after a fight which brought the matter into politics, upon the petition of 10,000 voters the matter was submitted to a vote of the people the following June. The result was 12,213 votes for and 560 against the franchise. Evidently the citizens of Portland prefer competition to monopoly after having tried both.

On November 6, the citizens of Omaha, Nebraska, at the regular election ratified an Independent franchise by a vote of 7,653 to 3,625. With Omaha added to the Independent list, the Bell's one claim to the toll service of the country surrounding it has disappeared, since in all of the territory tributary to Omaha the Independents outnumber the Bell. In Nebraska the Independents have approximately seventy-five thousand (75,000) telephones. In Iowa the Independents have over one hundred and eighty-five thousand (185,000), a total of two hundred and sixty thousand (260,000) in the two States; the Bell has only, approximately, eighty thousand (80,000) in the same territory. With Omaha built it will give the Independent companies at least forty thousand (40,000) additional telephones in the two States in three years, and completes the system in that section.

At the November election, Denver, Colorado, also voted in favor of an Independent franchise. Last summer one was granted at San Francisco, and within the last ten days the Independents have been given a franchise at Milwaukee. These cities, with Omaha, are the only ones of special consequence, except Cincinnati and Chicago, west of the Ohio River, where the Independents are not strongly intrenched or building. In Chicago a franchise has already been granted and the Independent company has over forty miles of tunnel under the city streets, this tunnel also being used for hauling freight. The telephone part of this property is controlled by a number of Chicago citizens and railway and telephone interests surrounding the city. It has lately been leased with all franchise rights to a syndicate of well known active Independent operators, who have completed their arrangements to see that it is fully developed, and Independent long distance connections given the numerous cities surrounding the metropolis, who have been clamoring vainly until now for such connections.

In other lines of business, competition has been the life of trade; the telephone business has not proved an exception. When the electric light was invented, many of the (artificial) gas companies that had been charging from $3.00 to $4.00 per thousand cubic feet were inclined to believe that their business was ruined. Forced by necessity, they began to study their economies, and by marketing their by-products and the introduction of new devices for the use of fuel gas, they were enabled to develop a day and night load, as well as a winter and summer load, which made it possible for them to reduce the price of gas to an average of $1.00 per thousand cubic feet, bringing it into competition with coal for cooking and heating. To-day there is practically no limit to the amount of light and heat required in this country. So it is with the telephone; there is more business in this country to-day than both systems can properly take care of, and the more rapid their development, the greater will the demand become until every one desiring telephone service has been satisfied—and who can say whether that condition will ever be reached?

There are approximately 7,000,000 telephones connected with both the Independent and Bell exchanges in the United States. If the development throughout the country was as great as in some counties of the central States, it would require at least

*Abstract from an address delivered before the Franklin Institute, Electrical Section, at Philadelphia, November 22, 1906.

Digitized by Google

14,000,000 telephones, twice the number at present installed. Without competition, there would be less than 2,000,000 telephones in the United States at present; equipment would be crude, rates high, the service unsatisfactory, and the management arbitrary. The small towns and the rural districts and millions of residents and small business men in our cities would be deprived of the greatest convenience of modern times. Not only has competition as represented by the Independent companies offered lower rates, better service through the use of improved apparatus, more courteous treatment and developed territory hitherto untouched, but it has forced the Bell to do likewise in sheer self-defence. While installing its own 3,500,000 Independent instruments, competition has compelled the Bell to increase in eleven years to ten times the number of telephones it had in service at the expiration of its more than seventeen years of absolute monopoly.

Recognizing the necessity for improvement in telephone conditions, the government of Manitoba appointed a select committee to inquire into and report regarding the various telephone systems. A similar committee had been previously appointed by the Dominion Government and had held its sittings in Ottawa; testimony taken before it filled two large volumes of an average of about one thousand pages each. The Manitoba committee, after making a thorough investigation of its own, and carefully considering evidence presented before the Dominion committee, reported to their Assembly. This body, after careful deliberation, decided to take the necessary steps to enable the Manitoba Government to construct and operate its own telephone system, and to petition the Canadian Parliament and the Crown to permit the expropriation of the Bell Telephone Company's plant and to refuse an extension to that company's capital. The Honorable Colin Campbell, attorney-general of Manitoba, in a speech before the Assembly, attributed the telephone legislation "to the growth of the Independent telephone companies in the United States, to the costly and limited service of the Bell Telephone Company, and the natural objection of the people of Canada to a monopoly."

In commenting on the progress of the Independent companies in the United States, the committee reports that "everywhere the entrance of such companies into the field has resulted in the furnishing of satisfactory service at much lower rates than had previously obtained and in the immense extension of the use of the telephone. A noticeable feature of the telephone development in the United States was the large number of long distance lines and lines giving inter-communication in rural districts."

It goes on to show that the general result of competition in the United States has been an immense extension of the telephone in all directions, and especially to the farmer, and a great reduction in rates; that in many cases both telephones could be rented for the price formerly paid for one, and that in places where the charge for both telephones is higher than for one, it was inconsiderable and more than compensated for by the increased and improved service. Regarding the relative desirability of the single or dual systems, Attorney General Campbell says: "I agree that it is undesirable to have two companies if possible to obviate such conditions, but if we cannot get competition we cannot get a reduction of price, and if we can only get the benefit of competition for the people by entering into the operation of telephones, both as a province and as municipalities, I think we would be justified in so doing."

Among the evidence considered by the committee were communications from business men regarding the actual working of telephone competition. The following is a summary of 1,400 answer from 189 exchanges in the United States to five questions addressed by an American banker to leading business men at such places. This evidence is valuable, coming, as it does, from our fellow citizens who are users of the telephone:

Question 1. Has competition resulted in better telephone service in your city? (a) As given by the Independent telephone company?

Answers—Affirmative, 1,245; negative, 26.

(b) By an improved service on the part of the Bell Company? Answers—Affirmative, 982; negative, 154.

Question 2. Has competition increased the number of telephone subscribers? Answers—Affirmative, 1,251; negative, 8.

Question 3. Has competition brought about greater civility and more courteous attention to the wants of the subscribers? Answers—Affirmative, 1,222; negative, 37.

Question 4. Have rates for telephone service been reduced by the advent of competition? (a) By the reduction of Bell rates formerly charged? Answers—Affirmative, 979; negative, 120.

(b) By the establishment of rates by the Independent company lower than formerly prevailed? Answers—Affirmative, 1,236; negative, 45.

Question 5. In your judgment, would it be preferable to return to the conditions prevailing before the advent of the Independent company? Answers—No, 1,245; yes, 14.

Of this last fourteen, all but five qualified their answers, favoring a return to a single system only upon condition that they would be given the same service as they were now receiving and at the same price. Many of the other answers were very emphatic in opposing a return to conditions existing before competition.

No community can afford to depend upon a monopoly to supply its telephone service for the following reasons and many more that might be enumerated:

Competition: First—Guarantees fair rates.

Second—Secures at least fair management and courteous treatment from both systems.

Third—Stimulates the best thought of inventive minds in improving the apparatus, and the careful study of operating conditions with a view to greater efficiency.

Another advantage of competition—and I wish to call special attention to this because it is so often overlooked by the champions of a single system—is the almost absolute assurance it offers to the subscribers of both systems against being deprived, by accident, of their telephone service. Even if the 70,000 telephones in your city were controlled by one company, many of your business men would still be compelled to have at least two telephones to take care of their business. In case of exchange trouble, fire, strikes, cable or line trouble in any particular section, you might be completely deprived of the use of your telephones until such trouble had been cleared. With instruments connected to both exchanges, the chances for this are almost entirely obviated. It is very seldom that both of your instruments will be out of order at once. The advantage of this until demonstrated by actual experience, as it has been in many cases, is not generally appreciated.

The Independent telephone interests to-day have a good organization, known as the International Independent Telephone Association of America. The organization formed in Detroit in 1897 for the purpose of defending damage cases brought by the Bell, finished its work by winning the last of the patent cases in 1904. In 1905 the association was reorganized in Chicago under what is known as the "Ohio Plan." This plan starts with an organization in each State, which usually divides it into districts to suit local conditions, each of the districts having a complete organization of its own, subject to the control of the State body. The various companies are represented on the basis of the units they operate, a unit being one telephone or circuit mile of toll line. The district organization selects delegates to the annual meeting of the State association on the basis of one representative for every one thousand units operated by their members. One delegate to the International Convention is allowed for each 10,000 units in the State. Each district selects a delegate to this convention, the remainder necessary to make up the full quota being elected at the State meeting as delegates-at-large. At the district meetings all questions with reference to traffic conditions between the companies, the development of territory, etc., are considered. At the State meetings matters of general importance to the movement in the State are taken up.

The International Association holds its annual convention between May 1st and July 1st. Permanent headquarters are maintained in Cleveland, where a corps of secretaries and a map maker are employed for the purpose of keeping in touch with the development in the various States. Now there are over

Digitized by Google

7,000 Independent companies operating in over 12,000 cities and villages.

Our plan of organization is not a new one; it is based upon the Federal plan of government, which has been in use in the counties, Congressional districts and States of the Union for more than a century. I believe it was Benjamin Franklin who first proposed a plan of this kind in 1754. It was known as the Albany plan, and outlined the formation of a separate government in each of the colonies, to be brought together in a central government for all of the united colonies. The plan under which our association is operating seems broad enough to cover every possible contingency in keeping the Independent interests working together in harmony and as a complete system.

It is often extremely difficult for those not directly interested in the Independent telephone business to understand the enthusiasm of the people who are engaged in it. It is more than a mere means for livelihood to them; it is a *cause*, something worth fighting for.

Features of Cable Engineering

By O. R. Barnes.

SUBSCRIBERS' feeder cables should be multipled symmetrically to keep them at the highest possible degree of working efficiency. It is possible to lay out a cable so as to obtain an efficiency of 100 per cent by splitting the counts and multipleing the pairs at the extremes of each unit as many times as those in the centre of the unit, but this practice of splitting counts makes it considerably harder to remultiple a cable when relief is needed, and therefore should not be resorted to except in case of absolute necessity. Nearly every telephone man who has spliced paper cables, or come in close contact with those who have done this work, knows that it is better and preserves the life of a cable, to handle the paper covered wires in specific bunches than it is to ramble through a whole splice of 200 wires in order to pick out the odd pairs that go to make up a split count; it is the constant handling and piecing out of the wires in a splice that eventually ruins the cable and causes unnecessary cable troubles. Seldom do we run across trouble in the middle of a section.

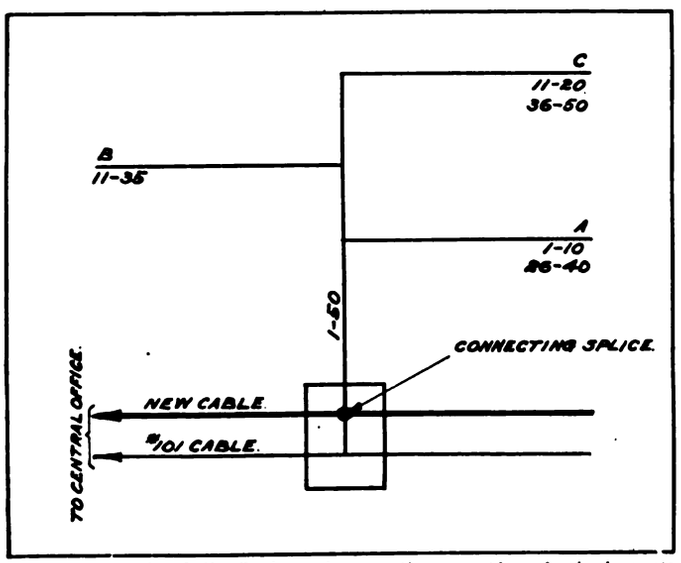

Fig. 1. Example of distribution using vexatious grouping of mixed counts.

In a growing plant, where party lines are used, 80 per cent efficiency is about the maximum that can be obtained without running grave chances of upsetting the symmetrical proportion of the cables. When 60 per cent working efficiency has been reached in a plant of this character relief should be planned and pushed forward before the 80 per cent mark is reached in order to insure proper relief at the proper time. When the cables are working on a 60 per cent basis there should not be any reason for split counts, and if the cables contain them it is safe to say that the engineering is bad, and that the engineer is not keeping the plant up to standard. When split counts are rung in so early in the game, the cables are bound to lose the flexibility which is the paramount item in keeping them in satisfactory working condition. An instance of the mischief which is created by split or mixed counts can easily be understood by referring to Fig. 1. Here we have a 50 pair lateral cable off of which is taken three 25 pair subsidiary cables, A, B and C. Now the lateral cables takes pairs 1 to 50 of the main cable, shown as No. 101, and sub. A takes pairs 1 to 10 and 26 to 40; sub. B takes pairs 11 to 35; sub. C takes pairs 11 to 20 and 36 to 50. The main cable, No. 101, becomes overloaded. It is working on something in the neighborhood of 100 per cent efficiency, and we must pull in a new feeder cable from the C. O. to relieve it. Onto this new feeder cable we decide to throw the 50 pair lateral cable containing the mixed counts, because it is the only thing to do to provide the required relief. And then right away we begin to chop up a new cable with mixed counts, unless we go to the laborious task of resplicing subs. A, B and C separately, so that they can be thrown straight with the lateral cable. It is simple to see that the pairs terminating at A, B and C were arranged only to satisfy the conditions pertaining to cable No. 101, and that the chances of the same combination satisfying the conditions of the new cable are remote and improbable—hence the mischief.

A comparison of the methods of multipleing cables of to-day and those of a few years ago will show that the modern trend is towards simplification and uniformity. The engineer who was known for his ability to work up fancy complications is no longer wanted by the large companies, because complications in cable work are too costly to straighten out. The day of standardization is at hand, and a man to be of any real utility must understand standard methods and work them out simply and accurately.

In the large companies the standard cable is 50 pairs, and feeder cables are usually multipled in units of 50 pairs; that is, a 300 pair cable would contain six units and the theoretical count would be 1 to 50, 51 to 100—25 to 300. Lateral cables of 100 pairs or less are not as a rule spliced direct to the main feeder cable, but to a stub cable, which contains one or two units more than the lateral cable. This stub cable is anywhere from four to eight feet in length, and the end is strapped to a convenient location on the wall of the manhole for splicing purposes. Stub cables, if used and arranged in proper sizes, should provide the essential flexibility for the maximum working efficiency and greatly decrease the chances for trouble that comes from constantly handling the wires in the main splice. When a large feeder cable is first spliced up the wires contained in each unit should be bunched and tagged in order that a great deal of trouble and labor may be saved when it becomes necessary to reopen the splice to make changes.

Coming now closer to the question of efficiency, which is really the ratio between the number of wires in use and the total number of wires in a feeder cable, we may employ a solution which has been found to be practical, and one which has always given good results wherever put in use. To preserve the cable plant we should strive to keep the ratio between the total number of pairs and the number of working pairs uniform, or nearly so, throughout the entire territory in which it feeds; or, to be more correct, the percentage should not be allowed to remain extremely high in one locality and at the same time extremely low in another. And for this reason, if for no other, a close system of supervision should be kept on the plant in its entirety. For this purpose cable efficiency diagrams answer all of the questions pertaining to the solution admirably. In Fig. 2 let A equal the total number of pairs; let B equal total number

Digitized by Google

of pairs in use; then the present efficiency equals *B-A*. For the proposed efficiency, let *A* equal total number of pairs, let *D* equal number of pairs in use, then the proposed efficiency equals *B-D*. The efficiency diagram before you shows conditions that should not exist and which are made to reveal themselves by a correct

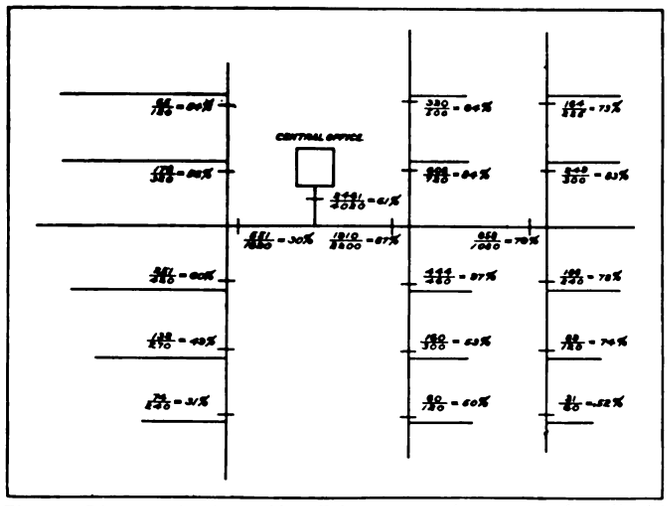

Fig. 2. Diagram showing cable efficiency at various parts of a district.

application of the rule just given. It shows one end of the plant has received considerably more cable than the requirements demand, while the other end is being sadly neglected—too much cable to the left of the central office and not enough to the right. In fact, it shows a very sad state of affairs.

ANNUAL MEETING OF THE NEBRASKA INDEPENDENT TELEPHONE ASSOCIATION.

AT the Lindell Hotel, Lincoln, Neb., on January 22nd, 23rd and 24th, will be held the Annual Convention of the Nebraska Independent Telephone Association. It is expected that there will be a very large number of interesting exhibits of telephone supplies and material, and partially for this reason a third day has been added to the convention period. Members intend to profit by this opportunity to inspect the latest devices which have been brought out by manufacturers. Proceedings which immediately concern all the Independent companies in the state will be brought up, and it is hoped that every company will be represented. The discussion of various features of practical operation, and of the year's advances in different sections is expected to bring out some very interesting information.

INDEPENDENT COMPANIES WIN OUT AT ARGENTA, ILL.

IN the vicinity of Argenta. Ill., good progress is being made by the Independent companies. The Argenta Telephone Company has combined with several other neighboring organizations to issue a directory which shows the rapid advances which have been made by Independents in that vicinity. All Independent subscribers in the county are now listed in a single book.

Although up to a short time ago the Bell company practically refused service to farmers, it is now making tremendous efforts to regain the business which was swept away from it as a result of this policy. The plan which is now being worked in this vicinity is to ship complete exchange equipment to every small town where the situation is controlled by an Independent telephone company. The Bell company hopes by the threat of installing a large amount of equipment, and giving extensive free service, to scare the Independents into entering into some sort of an agreement which will ultimately restore its monopoly. In this particular locality the farmers have all signed an agreement not to accept the Bell service as long as the local Independent company gives good service, although the Bell company is said to have made a proposition to install telephones on farmers lines free of charge for a year.

EXTRAORDINARY PROFITS OF BELL COMPANY AND JUGGLING OF FIGURES TO CONCEAL THEM ALLEGED IN REPORT OF CHICAGO'S CITY AUDITOR.

IN presenting a report on his investigations of the books of the Chicago Telephone Company, City Auditor Louis E. Gosselin, of Chicago, is said to have given his opinion that the company's actual profit for the year 1905 was $2,626,695.67. According to the books of the company, its net earnings for the year are $1,626,811.

It is said that City Auditor Gosselin explains the difference between these figures and those given out by the company by a statement that the books show thirty-five items charged to expense which he believes do not properly belong there. These amount to $269,884.66. The company also set aside a reserve for insurance amounting to $150,000, and another reserve of $275,000 for litigation. The amount paid in royalties to the Bell company for instruments is given out at $305,000. The experts of the city government are reported to have declared that, for the purpose of hiding actual profits, the company placed among expenses no less a sum than $999,884.66, which does not belong there. This would produce the difference between the 9.5 per cent. the company figures for the rate of profit on the invested capital and the 16.6 per cent. which the city's experts have given out as the true profit.

BOOK REVIEW.

BUSINESS TELEGRAPH CODE. Compiled by Burcham Harding, contains 304 pages. Published by The Business Code Company, Chicago, Ill. Price $7.50.

This telegraph code is said to comprise ten times the number of phrases and numerals given in the bulky volumes of the several standard code books, and all this information has been brought within the compass of a book of pocket size. The system is based upon the use of root and terminal code words, the former of five letters, and the latter of four letters. All code words thus consist of nine letters, arranged to form pronounceable syllables. This plan not only has made it possible to reduce the volume to a convenient size, but conduces to flexibility. The list of phrases embraces the entire field of commercial telegraphing for buying, selling, prices, orders, quotations, contracts, shipping, delivery, financial matters, etc. All code words are so constructed as to minimize the probability of mistakes of telegraphers, and the book also provides two tables by means of which words mutilated in transmission can be traced.

It would seem that this book should have a very wide field of usefulness in supplying a means of reducing the cost of messages between telephone operating men and manufacturers, and between the home offices of manufacturing companies and their sales representatives.

NEW TERRITORY OPENED UP BY INDEPENDENT COMPANY IN NEW YORK.

AT Warren, N. Y., the Kinzua-Corydon Telephone Company, the plant of which has been under construction for some time, recently opened its exchange. The completion of this plant, and the opening of its lines to business enables people in a considerable territory to use Independent telephones. Among the places which have received this advantage may be mentioned the townships of Elk and Corydon, in Warren County, the townships of Corydon in McKean County, and Elk and South Valley in Cattaraugus County, all of which places will be put in direct communication with Warren, and a large amount of adjacent territory. The new company will connect with the Union Telephone Company, and thus all parts of Warren County may be reached. The policy of these affiliated organizations is to thoroughly develop the territory, thus giving a complete service, where previously the only means of obtaining telephone communication with a person has frequently been to send for him from a Bell pay station. It is expected that the new companies will soon be giving good service not only to villages, but also on a large number of rural lines.

PAT ROONEY ON TROUBLE.

PAT ROONEY, a Cleveland lineman, is much averse to admitting ignorance of any branch of telephone work.

He started as a full-fledged lineman "on a bluff," to use his own expression.

"Sure," he afterwards remarked, "phwats the sinse of a lad startin' as a groundsman fur $1.75 a day whin by only gettin' a pair of spurs and lookin' rale tough he kin be after gettin' $2.85? Niver mind about the climbin' business; ye can larn that as ye go along. To use wan of the Cleveland Telephone Company's mottos, 'There's a difference.' Look at me brother Dinny in New York. There was the gossoon for ye. I'll be blissed if he didn't start out as a Frinch instructor fur some big bug family. Begorry, he didn't know as much Frinch as a dago, but that didn't worry Dinny. Well, I tell ye phwat he done. The day before he was to start instructing the kids, he goes to the Y. M. C. A. and takes his furst lissin in Frinch. The next day he tached phwat he'd learned to the kids, and no wan was iver the wiser. The last I heard of him he were studying Frinch astronomy, be jaggers."

It is related of Pat that one of the first questions asked of him by the foreman was whether he could guy a pole.

"Begorry," Pat replied, "I've often guyed a Dootchman, but niver worked wid anny of thim Poles."

One morning recently, after a heavy rainstorm, several linemen were pressed into service to assist in clearing trouble. Pat Rooney was one of the number, and it was his first experience as a troubleman.

The wire chief delegated Pat on a case of a swinging ground, which trouble Pat found readily enough, and, walking proudly into the office where the telephone was located, he opened the bell box, looked over the apparatus very knowingly and blew into the transmitter as 'experts' are wont to do. "Yer tellifone's all right now, sur," he remarked to the subscriber, who had been watching his every move.

"What was wrong?" asked the subscriber.

"High insulation resistance," responded Pat promptly.

"I don't know what that is," said the subscriber, suspiciously.

"Sartinly ye don't," said Pat with a look of superiority, "but if ye were a tellifone linesman ye'd understand it. Good day to ye, sur."

"Just wait a minute," shouted the subscriber, who had taken down the telephone receiver. "What is this scraping noise on the line? Here, listen for yourself."

Pat took the receiver, listened very intently for a few moments and, handing it back, replied:

"Don't bother yer head about that nise, me good man. It's only sparrows picking on the wire."

"But it is much louder at times than it is now," persisted the subscriber.

"Will, them's pigeons," argued Pat, without batting an eyelid. "Sure, sur, ye ought to be thankful ye ain't out Wist, where the eagles——"

But the subscriber had fled into the next office.

GOOD INDEPENDENT DEVELOPMENT AT STREATOR, ILL.

STREATOR, ILL., with a population of about 17,000, has an Independent telephone company with 1,460 city subscribers, giving a development of one telephone for every eleven persons. This company, which goes under the name of the Streator Independent Telephone & Telegraph Company, has also 540 rural line subscribers. It began operations July 1st, 1901, with only 287 subscribers, and its growth is attributed to the efficient service it has given from the first on farmers' lines.

At the present time nearly every farmer within a radius of ten miles of the city has a telephone, and is in direct communication with the city exchange. The company also has agreements which give it exclusive connection with farmers' line companies having an aggregate of about one thousand subscribers in the neighboring localities of Cornell, Ransom, Long Point, Leonore and Grand Ridge.

COMMITTEE OF- PROMINENT ENGINEERS TO INVESTIGATE CONDITIONS IN CHICAGO.

W. H. CRUMB, telephone contractor, of Chicago; G. W. Wilder, consulting telephone engineer, and Prof. D. C. Jackson, head of the electrical department, University of Wisconsin, have been selected as the members of a commission to investigate the Chicago telephone situation. They will report to the city on engineering matters, supplementing the recent report of the city auditor.

THE EDITOR'S PAGE

MEMORIZATION OF NAMES BY OPERATORS.

ONE of the largest Bell companies recently issued a general order from which we quote as follows: "Where a portion of the subscribers in an exchange pay for county service and the remainder for local exchange service only, the local manager must place before the operators on the switchboard a list of those who have county service, and the operators must see to it that the non-subscribers as well as subscribers who are not paying for county service are not permitted to use the telephones of subscribers who are paying for county service."

How much simpler it would be to use a conventional designation for such lines. Line lamp caps with special markings are easily obtainable, and it is only the work of a moment with a little paint to put a special designation mark on a drop.

It is to be hoped that all Independent companies are alive to the advantages of this scheme. It gives the operators one mark to remember, in place of a list of names, subject to change at any time. Reduction of the amount of mental effort demanded of operators in this manner simplifies their work and enables them to handle calls more efficiently. The scheme can be applied to a great variety of special uses without becoming too complicated to be valuable.

KEEPING STEP WITH THE BUILDERS.

LOOKED forward to by telephone companies as a real and probable condition which will be reached at no very distant time is that state of development represented by a telephone in every family. More and more is telephone service coming to be looked upon by the public at large as a utility as necessary, or even as indispensable, as have become the water service, or the artificial lighting service in towns. As people come to appreciate the value of their own time, and the folly of spending it in the running of trivial errands, they grow more appreciative of the fact that the installation of a telephone, instead of being a drain upon the family resources, is a proper measure of economy. Evidences of this attitude are plainly given by the remarkable figures for the growth of telephone systems during the past year, and become still more notable when an attempt is made to separate the telephone subscribers into classes. It appears that the service has recently been extended among users estimated to have what are commonly called moderate incomes so rapidly as to altogether pass the proportions which might be expected from the reduction of rates to figures lower than those which were common a few years ago.

This continued increase not merely in the size of the systems, but in the rapidity with which they are to be extended is in many quarters expected to continue for some time to come with some considerable confidence. Where this confidence is based upon firm and reasonable grounds it has a distinct business value, and can in fact he turned to account in the effecting of economies in construction. It is well known that the cost of building many exchanges, and of many underground conduit systems has been considerably larger, owing to the necessity of making enlargements frequently, than would have been the outlay if a surer appreciation of the possibilities of development had been realized. This being demonstrated for certain portions of the equipment of a telephone system, there yet remains an opportunity to consider the bearing of an approximately assured rate of progress upon substation equipment, and more particularly upon substation wiring. In large office buildings erected in cities the builders would no more think of leaving out provision for telephone wires than they would of omitting the lighting circuits. It is quite possible that someone will work out a plan for wiring residences at the time of their erection which will lead to economies which may in a measure be compared to those effected in the larger buildings.

There are several things which would tend to make the wiring of a building while other construction is in progress a measure of economy. In the better classes of residences concealed wiring is now almost the only acceptable form. The boring of holes and other slow and laborious work necessary to carry a pair of wires through a series of partitions is a costly method of carrying conductors to the necessary terminal point. Although it may be objected that the proper location of outlets at a time considerably in advance of the occupation of a house would be difficult, a considerable amount of multipleing could be done without bringing the cost up to that of a single good job of concealed work. Then, if the work is well done at the start the wires are likely to be well protected, and there will be little likelihood of trouble on this portion of the line.

There are numerous disadvantages in the plan which are just as evident as some of its desirable features. It all comes down in the end to a balancing of costs. With a proper classification of residences, and a practical plan of wiring, it would seem likely that in many places the installation of telephones would proceed at a rate sufficiently near to that of the erection of buildings to make such a scheme show a small profit and in these days even a small profit is sometimes worth taking a chance for.

CONGRATULATING THE NEIGHBORS.

CONVENTIONS are the talk in a number of States just now. And most remarkable of all the talk which is being circulated is that about possibilities. One would think, on hearing of the good things to come, that the Independent telephone movement had just been started, had broken into a new field and was celebrating a victory without a precedent. Whether it be Omaha or Milwaukee or some other large city, its winning is the thing that is worth while mentioning in every gathering of Independent telephone men. It is this enthusiasm, this perennial delight in achievement anywhere in the field, that gives to the movement its best strength.

As soon as entrance is gained into a place which has long held out against the Independent companies the effect may be seen in increased activity throughout an entire State. With the opportunity for the transaction of business with the larger places companies which have long decried toll service begin to wake up, and think that after all there may be something in it. So we see the direct, business interest in these advances extending in circles which are gradually growing wider. It is generally recognized that each new link in the chain of development contributes to the strength of those already in existence. With the extension of connections between one city and another growth in each quarter becomes of constantly increasing importance to those in neighboring places.

A striking feature of these meetings of Independent telephone men is that nearly everyone present seems to be well informed as to progress in the whole country. The Independent manager keeps pretty closely in touch with new developments. He realizes that what is done to strengthen an Independent company in one part of the country improves the standing of the Independents as a whole, and so is a help to him in his own work. So it is that the spirit of co-operation is so strongly in evidence at all gatherings.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

CUTTING WIRES NOT A LEGAL REMEDY.

Under a verbal agreement with the owner of a vacant lot in the outskirts of a town, we extended a wire diagonally over his property, but without planting poles in the soil. He now denies that he made any such verbal agreement and has actually gone so far as to cut our wires. Can we compel him to let us put our wires up again, and if not, what can we do to him for making us so much trouble and expense? N. S.

EVEN if he had never given you permission to stretch your wire over his property he would have no right to cut it in the summary manner he did because a telephone wire stretched over the property of another without authority, causing no obstruction, is not a nuisance which may be summarily abated. His proper remedy if he had not given you permission to cross his land would have been an action of ejectment. But having given you verbal permission to over-build his property, you were in lawful occupation of it. He could be either sued in damages for the injury done to your line or prosecuted under a statute prohibiting the willful cutting of telephone wires. You are not in a position to compel him to let you put your wires back because his verbal permit to you was nothing more than a license, which is revocable at the will of the licensor. On these questions see McGowan vs. State (Ala.) 40 S. 142; Butler vs. Frontier Tel. Co., 109 App. Div. 217, 95 N. Y. S. 684.

WISCONSIN METROPOLIS COMPANY TRYING TO FORCE ENTRANCE TO MILWAUKEE.

MAYOR BECKER, the forty-six aldermen, the City Engineer, and the members of the Board of Public Works of Milwaukee, Wis., have been served with a writ of mandamus requiring them to act and approve the plan of the Wisconsin Metropolis Telephone Company for laying conduits and stringing wires for a new telephone system in Milwaukee or show cause on Janury 15, 1907, for their failure to obey the mandate of the Court.

The company filed its petition for the right to lay conduits, erect telephone poles and string wires with the Board of Public Works on June 11, 1906. No franchise was sought by the company. A permit alone was asked for. No action was taken on the petition by the city, excepting the referring of the petition to the council by the Board of Public Works.

It is claimed by the company that no franchise is necessary. The proceedings instituted will be in the nature of a test to see whether the company is right in its contention that the city has the authority only to determine in what manner a telephone company shall install, maintain and operate its system in the public streets and alleys.

IN PROSECUTION FOR MALICIOUS CUTTING OF WIRES THERE MUST BE A CRIMINAL INTENT.

ON the 18th of November, 1905, a query was answered on this page under the heading of "Trimming of Trees in Ohio." A telephone company had a franchise from the village council to erect its poles, etc., in the streets of the village under the supervision of the street committee of the village council. The owner of a lot fronting on the street on which the company's poles stood brought suit for damages for trimming the shade trees on his lot between the curb and the sidewalk. The poles were forty-five feet high and located as directed by the street committee of the village council, which specified the length of poles and said the company would have to do some trimming on the trees in question. The property owner also caused the arrest of each supervisor of construction and also the general manager of the company on a criminal charge of willful and malicious destruction of property. The criminal case was tried in the Common Pleas Court at Delta, O., and a fine of twenty-five dollars imposed upon each defendant. The case was appealed by the defendants to the Circuit Court and reversed upon the following points: First, that the verdict was against the weight of evidence; second, that the Court erred in its charge to the jury, and third, that there was no evidence of any intention to commit a crime. The Circuit Court remanded the case to the Common Pleas Court for retrial, but the prosecuting attorney states that he will never retry it. The civil cases have not yet been tried, but we are informed they will be contested to the last ditch, as there seems to be no question of the company's right to take the course it did.

TELEPHONE IS NOT A BET REGISTERER.

"WITHOUT doing violence to the ordinary meaning of the words, a telephone wire, with the receiver and transmitter, cannot be said to be an instrument or device for the purpose of recording or registering bets." So said Judge Gantt in an opinion recently handed down in the Supreme Court of Missouri, which exempts Charles Oldham from the payment of a fine of $500 imposed by the criminal court in Jackson county and discharges him from the custody and punishment of that court. Oldham was convicted of violating the law in relation to registering and recording bets on horse races. The act of 1905 prohibits the use of any instrument or device in any building or enclosure in the State for the purpose of recording bets, either within or without the State. Oldham was the man who figured in the racing at the Elm Ridge track in Kansas City, Mo. He had a telephone attached to his person and transmitted thereby to another person in Kansas City, Kan., transactions at the track and the results of wagers. He was convicted under the provisions of the act passed by the recent session of the general assembly repealing the breeders' law, under which all the race courses in the State had been conducted. The judgment of conviction is reversed upon two grounds: First, that the indictment was not drawn by the prosecuting attorney in accordance with the language of the statute; second, that the blackboard, telephone instrument and numbered tickets of admission were not "instruments and devices within the meaning of the statute for the purpose of registering bets." The court further said: "It may be said that the construction of the telephone line and the arrangement for having the bets registered and recorded in Kansas City, Kan., was a perfectly obvious trick and subterfuge for evading the law and we agree with the counsel for the State that such was the obvious purpose and that the disguise was too thin, but after all the question is not whether the defendant has successfully evaded the statute, but whether he has violated it."

In an interview with Governor Folk, the latter has announced that if any amendment is needed to make the act of 1905 effective he will recommend it to the Legislature next month. The Governor also announced that race track gambling in Missouri was dead and that the bookmakers might as well realize that it cannot be resurrected by telephone or any other device that the statutes can be made to cover.

IN THE OPERATING FIELD

PROFITABLE DIRECTORY ADVERTISING IN BALTIMORE.

FROM time to time we have taken occasion to allude to the large amount of advertising carried by the Maryland Telephone & Telegraph Company, of Baltimore, in its directory. Persons interested in the subject will doubtless appreciate the value of this by-product of the Maryland company's business more fully, however, if they have accurate figures. Through the courtesy of Mr. Thomas White, traffic manager of the company, we are able to say that the receipts for this advertising amount to about $7,000 per annum. This amount practically pays for the directory. The company states that its patrons have been very much pleased with the results obtained from this form of advertising. One of the special plans which has been productive of much business has been the use of small posters advertising various comodities, which have been from time to time placed on the back of the cover.

EXTENSION OF INDEPENDENT TOLL SERVICE FOR MICHIGAN.

TELEPHONE men representing the Independent companies of Michigan were in Grand Rapids recently to talk over the extensions which will be necessary to give adequate toll service between Grand Rapids and Detroit, as well as to other large cities outside of the State. The visitors were all members of the State Traffic Committee of the Independent Clearing House Association, and this was the regular quarterly meeting of the committee. There were present W. B. Woodbury, general manager of the Home Telephone Company of Detroit; H. A. Price, general manager of the Saginaw Valley Company; F. M. Howard, assistant general manager of the Valley Company at Flint; C. L. Norton, special agent of the United States Telephone Company of Cleveland, Ohio; W. J. Melchers, general manager of the Union Telephone Company of Alma, and General Manager Tarte of the Citizens' Company.

MEETING OF IOWA TELEPHONE MEN AT WATERLOO.

MEMBERS of the Black Hawk Local Telephone Association met recently at Waterloo, Iowa. The present meeting was the first annual gathering of the members of this association since it was organized. Reports showed a very satisfactory growth of all the companies represented. A discussion of the interchange of business between telephone companies occupied an important place in the meeting. The members appointed as a committee to confer with the managers of free exchange companies the following gentlemen: J. E. Conry, M. C. Young and G. E. Evenson. They will endeavor to induce managers of companies of this class to join the association, and perfect arrangements for a fair division of costs and income on inter-connecting lines.

In addition to the matter of the exchange of service many other subjects intimately connected with telephone operation were discussed. Addresses were made by E. W. Haradon, G. A. Evenson, William Crownover and others. Among those present at the meeting were:

E. Hermence, president, and B. W. Farrand, manager, of Sumner Telephone Co.; C. W. Ayers, manager Waverly Telephone Co.; W. J. Stanton, superintendent Corn Belt Telephone Co.; J. F. Van Voss, manager Dubuque Telephone Co.; G. A. Evans, secretary Farmers' Mutual Telephone Co., of Finchford, and secretary of Black Hawk Local Association; F. R. Decker, manager Farmers' Mutual Telephone Co., of Janesville and vice president of Black Hawk Local Association; F. W. Jacob, director Farmers' Mutual Telephone Co., of Janesville; E. W. Haradon, president Farmers' Mutual Telephone Co., of Jesup, and president of Black Hawk County Local; A. F. Whittle, district manager Corn Belt Telephone Co., of Waterloo; M. C. Young, manager Farmers' Mutual Telephone Co. of Jesup; M. S. Allen, predient La Porte Telephone Co.; George Meyers, secretary, and William Oltrogge, vice president, Washington Mutual Telephone Co., of Waverly; H. C. Steege, Waverly; T. R. McElhinney of the Traer Farmers' Mutual Telephone Co.; J. L. Paine, director Interstate Telephone Co., of Fayette; H. B. Shoemaker, secretary and treasurer United Exchange Co., Reinbeck.

A REMARKABLE FARMERS' LINE.

POINTING out the wonderful burden that can be imposed upon a farmers' line, the following letter received from a correspondent speaks for itself:

G. W. Kotts,
ELECTRICIAN,
WITH
N. Dak. Independent Tel. Co.,
Hope, North Dakota.

Hope, N. Dak., Dec. 31, 1906.

The American Telephone Journal, New York, N. Y.

Gentlemen:—

"In your queries of Dec. 22-06 you have someone that asked the question of phantom his lines with incandescent lamps, and you answer him that it cant be done. Now I wish to say that I have phantomed a metallic line with lamps some two years ago. (farm lines at that) and havent had any more trouble on them then with an ordinary line I ring 19 phones through my phantom and have 14 Phones on the metallic line all working O. K. I havent made three circuits out of two metallic lines but make two out of one metallic line that is one is a ground line. you see we run out some 8 or 10 miles a metallic line and then Phantom a ground line over this metallic line in some cases 10 to 15 miles further with all the Phones on that we can find rings for. we have to build here in N. Dak. a great manny more miles to the number of farmers per mile then in the east so our farmer lines are quite long. This Phantom of mine gives no trouble from lightning as the lamp cant burn out very easy. I just called attention to this as I thought that as long as I had made a success of it it wouldent do any harm."

Yours respt., G. W. Kotts.

Telephone men unfamiliar with conditions where lines are expected to carry a good heavy load will undoubtedly be somewhat surprised at the quality of the engineering skill to which this letter bears testimony.

AN EXAMPLE OF BELL RURAL SERVICE.

IN the issue of a newspaper published in Springfield, Mass., dated Dec. 30th, 1906, there was published a six column article intended to show the people of Western Massachusetts that the local Bell company is rapidly developing its small exchange and rural line business in this district. In the article appears the following:

"On these country lines it is quite amusing to notice how far a message sometimes must travel in order to cover a short distance. For instance, there is such a case in Blandford. The Otis line runs over into Blandford and ends at a house in that town. The next house has an instrument connected with a line from Blandford Center. The two houses are scarcely a stone's throw apart, and yet if the occupants of the former house wish to telephone to those of the latter, here is the course the message must pursue: Over the hills to Otis, down to Lee, then to Pittsfield, thence to Westfield, up the hill to Blandford Center and out to the other house; in all a distance by wire of upward of 80 miles, with toll rates accordingly. Much cheaper, a lot easier and certainly quicker, to simply shout from one house to the other."

The write-up which contains this joke is prepared from material which was very evidently furnished by the Bell company. Prob-

Digitized by Google

ably the jest is not appreciated by the persons who have to pay tolls on eighty miles of wire to cover a few yards, but it does give an amazing insight into the reasons behind the old argument "Don't support an Independent company, which has only short lines. Help the company that can give you long distance connections."

CONDITIONS GOVERNING SPECIAL ARTICLE COMPETITION.

AS first announced in the issue of December 29th, 1906, THE AMERICAN TELEPHONE JOURNAL offers a group of prizes for the best three articles which will show the true extent of the loss in a case of damage to a telephone company's equipment from a sleet or snow storm, and a method of building by which such loss could have been prevented.

These articles must describe the effects of an actual accident, resulting from the loading of wire, cables or fixtures with sleet or snow during the present winter.

Each article must be accompanied by one or more photographs of the sleet-covered equipment, taken immediately after its fall. Articles must describe fully the nature of the load on supports, telling why they failed; the form of construction which the author believes would probably have been most effective in preventing the loss, with reasons for his belief, must be described. Particulars as to the effect on service, such as number of lines out, length of time interrupted, number of complaints, any advantages gained by competitors not subject to such interruption at the same time, and losses due to rebates to subscribers whose lines were put out of service, should, if possible, be included, in order to give sufficient information to enable readers to form an approximate idea of the actual cost of damage, from the broadest point of view. The actual cost of material and labor for making repairs would of course be desirable.

Articles must not exceed 2,000 words in length. Awards of $20, $15 and $10 will be made for the first, second and third prizes, respectively. Payment for any other articles received will be made at regular rates if accepted for publication, so that the time expended by any contributor of good material will bring him due compensation. THE AMERICAN TELEPHONE JOURNAL reserves the right to refrain from considering the author of any article as a candidate for a prize if the material submitted cannot be developed into a form acceptable for publication. Each article must deal with a single case of line failure. Any person may contribute as many separate articles as he wishes, provided they deal with separate subjects. Awards will be made as soon as possible after April 1st. Judgment will be based on the merits of photographs and articles from a strictly practical standpoint, on the value of the facts they present, and not on the mere wording of the articles. No discrimination against an article on account of lack of literary style will be made. All competitors will be on an equal footing, whether they may be subscribers to this journal or not.

WISCONSIN INDEPENDENT TELEPHONE MEN TO MEET AT MADISON.

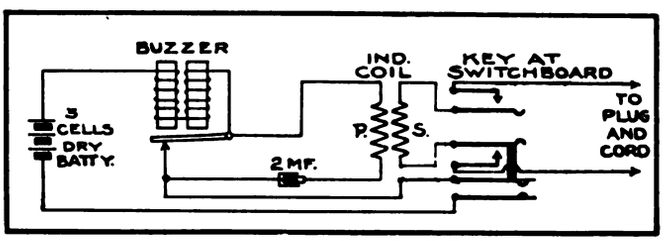
TWO days, January 16th and 17th, will be spent at Madison, Wis., by delegates from the Independent telephone companies of the state, who will then meet for their annual convention. The sessions will be held in Turner Hall. As the telephone sessions at the Chicago Electrical Show come on the first days of the same week it is expected that many members of the Wisconsin Association will make a single trip which will cover the two cities.

Wisconsin by the granting in Milwaukee of the franchise to the Milwaukee Independent Telephone Company, on November 12th, and the subsequent incorporation of the Independent Long Distance Company, has assumed a new and exceptionally prominent place among the states in which Independent companies are rapidly advancing. H. D. Critchfield, of Milwaukee, who is president of the two new telephone companies, will be at the meeting prepared to take long distance contracts from independent companies in all parts of Wisconsin. Other prominent Independent telephone men, many of them from outside states are expected to be present, and will explain developments in various portions of the field. Manufacturers will have interesting exhibits, and a large attendance of operating men is expected. This meeting promises to be the most important ever held in Wisconsin, and will no doubt lead to some exceedingly interesting developments.

A HOWLER CIRCUIT.

By F. C. GREENWALD.

A FREQUENT cause of trouble is the failure of the subscriber to restore the receiver when through using the telephone. Sometimes the receiver may be accidentally removed from the hook without the subscriber's being aware of the fact. In small exchanges not equipped with some special instrument it is customary to notify the subscriber to hang up by ringing on the line. Ringing is unsatisfactory, as it fails to produce sufficient volume of tone to be heard for any considerable



Simple Howler Circuit for a Small Exchange.

distance, but also causes bells of other subscribers on the line to tinkle.

A cheap and efficient form of howler can be readily constructed by the man about the exchange, and it will tend to a considerable degree not only to remedy this trouble when it occurs, but also go far toward preventing this common occurrence. The method consists of throwing the tone produced by the make and break of the contacts of a vibrating buzzer upon the line by means of a suitable key on the testing table or specially provided at the switchboard, as indicated in the sketch.

Two or three good dry cells connected with a well-made buzzer adjusted to a high speed will send an alternating current of high frequency through the line, telephone and condenser so as to produce a loud, shrill noise in the receiver at the sub-station in trouble and not affect the bells at any sub-station on the line. Although the buzzer circuit may be connected directly to the line, it is preferable to insert an ordinary magneto induction coil, which acts as a transformer. This also insures a constant resistance in the buzzer circuit.

TARIFF AND ROUTE BOOK ISSUED BY TEXAS INDEPENDENT TELEPHONE COMPANIES.

A TARIFF and route book has been issued by the following Independent companies operating in the state of Texas: South Texas Telephone Company, Austin, Texas; Texas Telephone Company, Waco, Texas; Brazos Valley Telephone Company, Waco, Texas; Hillsboro Telephone Company, Hillsboro, Texas; Ellis County Telephone Company, Waxahachie, Texas; Ft. Worth Telephone Company, Ft. Worth, Texas; North Texas Telephone Company, Ft. Worth, Texas; Texas Consolidated Long Distance Company, Dallas, Texas; New Long Distance Telephone Company, Sherman, Texas.

The book is issued for the use of exchange managers, agents and long distance operators, and contains a complete list of stations which may be reached over the lines of the companies who publish it. To keep it up to date, it will be followed by a supplement every six months. Instructions are given for routeing, handling tickets, etc., and an operator's code is given. Following this information are pages with names of towns and the square number, blank spaces, etc., for filling in routeing instructions. This book, which was forwarded to us through the courtesy of J. B. Earle, general manager of the first three companies named in the list, seems incidentally to give convincing evidence of the extent and value of the Independent long distance service which is being gradually built up in our largest state.

QUERIES

LOADING COIL CASE.—(811.)

In a recent AMERICAN TELEPHONE JOURNAL issue I noticed a reference to a patent on a loading coil case. Can you tell me what this is used for, and where it is located in practice? L. R.

The loading coil case referred to is used to contain and protect the "loading coils" installed in connection with long distance trunk cables. These coils are installed at intervals determined by mathematical investigations, based upon the electrical constants of the cable with which they are used, their function being to overcome, in a measure, the harmful effects of capacity, neutralizing them by the opposite effects of their inductance. The cases are usually set in manholes at the proper locations along the route, and wires from the cables are led into them through the opening at the top, to make connection with the individual coils.

DANGER FROM HIGH POTENTIAL CIRCUIT.—(812.)

Will you please give me the following information? The street car company is going to string a 25,000-volt circuit into this city on 40-foot poles, and I would like to know the safe distance from this line for a lineman to work on a common battery line of the telephone company. Please state the distance in wet and dry weather. Please answer as soon as possible, as I want to do some work on the telephone line and, having had no experience in these circumstances, do not want to get killed. H. R.

A 25,000-volt circuit and a hive of bees are alike in one respect —and that is that it is best to keep as far away as possible from both unless thoroughly acquainted with the characteristics peculiar to each.

However, a man might safely work on a dry day on a common battery line within a foot or eighteen inches of the high potential circuit, and as close as three or four feet on a wet day, supposing the line he is working on to be grounded also the high potential circuit.

The great danger lies not so much in the nearness of the telephone lines to the heavy lead as to the liability of accidentally handling a wire that has in some manner become crossed with the heavy current.

The writer had in his employ at one time a lineman who had accidentally become too well acquainted with a circuit of high voltage on one trip up a pole from which he immediately descended and headed straightway for a paint store, where he purchased a gallon can of bright red paint and a brush. He then followed the telephone lead the entire distance it paralleled the power lead and on each pole where the power wires were in a position at all dangerous to one working on the pole, he placed a nice broad red stripe on a level with his eyes, where he couldn't miss it next time occasion demanded a climbing of the pole.

PHANTOM CIRCUIT.—(813.)

We wish to use a phantom circuit on two lines running between two towns about 14 miles apart. These lines are trunks between common battery switchboards. Please send a diagram for connecting the phantom circuit; also state resistance of coils to be used. We have a coil with winding as shown in enclosed diagram, Fig. 813a. Could this be used?

Please give some good circuit for magneto toll line which can be used with common battery cords without a repeating coil and also get supervision. We are working two lines now, but find the common battery cord holds up the clearing out drop at the magneto exchange all the time it is in, although it does not throw any noise on the line. A. C. S.

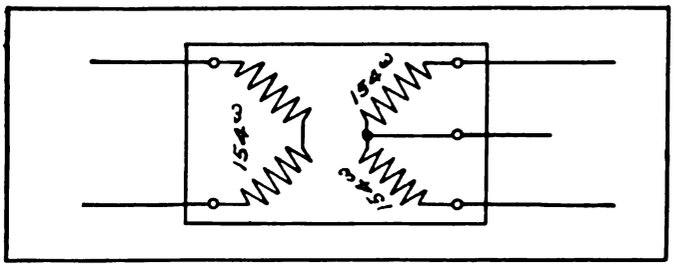

Fig. 813a.

Referring to the diagram Fig. 813*b*, A, B, C and D are repeating coils. They should be made quite long, with four windings of about 100 ohms each. Circuits 1-2 and 3-4 are your regular lines, while 5-6 is your phantom.

Although we do not know what else is on your poles, we do not think you will get any cross talk in this short distance. If you have any trouble of this sort, advise us and we will suggest a plan for transposing. The coil you illustrate would scarcely be applicable, owing to the very low resistance, as shown on one side.

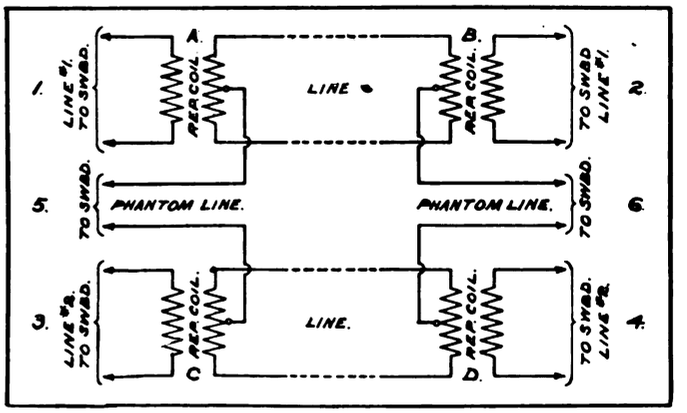

Fig. 813b.

In relation to your second question, which we do not fully understand, we would like to have you explain conditions fully. We shall then be glad to give you an answer to suit your requirements.

UNBALANCING CIRCUIT BY SUPERVISORY RELAY.—(814.)

Balancing telephone circuits is constantly insisted upon, yet in the standard Bell cord circuit a relay is permanently connected in one side only. How is it that this does not bring in troubles? F. N.

The resistance of this relay is very low (about twelve ohms) and it has two windings in parallel, one of which is non-inductive. As a matter of fact, there can be detected a slight difference from the results obtained with a perfectly balanced cord circuit, but for ordinary commercial uses the detrimental effect is so small as to be negligible.

PAINTED SWITCHBOARD LAMPS.—(815.)

Lamps furnished for certain purposes on our switchboard are covered with black paint for a little over two-thirds of their length. Other lamps used on the same board have no such covering. Can you tell me the reason for this difference? B. R.

The lamps you mention as having a black coating of paint are intended for use with a special mounting strip, arranged for twenty lamps per strip. The space available in a switchboard panel is so narrow that this mounting strip is made up without any solid backing, extending well to the rear, as is found in most strips which accommodate only ten lamps. When these strips were put in service it was found that the light from a lamp, when illuminated, was sufficiently bright to shine through the adjacent lamps on either side, and cause them to glow. This often confused the operators, appearing as a false signal. To remedy the defect the lamps furnished for this style of mounting are coated with paint which covers all but the forward portion of the lamp, effectually preventing the illumination of any opal except the one associated with the lamp through which current is passing. Of course this is in the way of being a makeshift to avoid a practical difficulty. As only the lamps used in the special style of mounting referred to are subject to this difficulty, they alone have the painted covering.

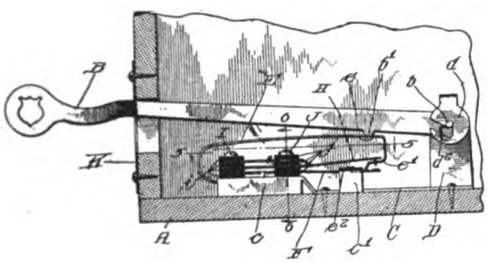
TELEPHONE PATENTS

TELEPHONE HOOK SWITCH.

George G. Foster, Chicago, Ill., patents (No. 839,830; dated January 1st, 1907; filed July 26th, 1904; serial No. 218,301) and assigns to the American Electric Telephone Company, Chicago, Ill., a telephone hook switch.

From the base of the bracket plate *C* extends at right angles



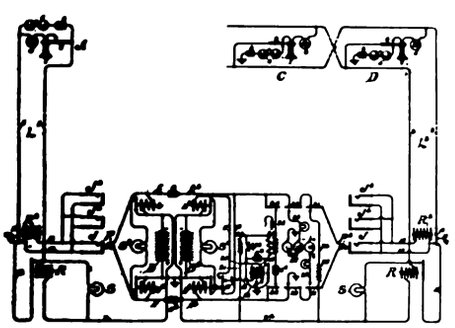
an upright portion *D*, formed at its top with an overhanging downwardly bent portion *d*. The parallel sides of the supporting device thus formed are slotted, as shown at d^2, a similar slot in the opposite side being concealed by the hook *B*, to receive the pivot pin *b* of the hook. This construction permits the switch-hook to be readily disengaged from its bearings and removed.

The upper portion of the spring *E* is provided with a depression *e*, adapted to be engaged by a lug b^1 extending downwardly from the lower side of the hook. The spring *E* has a downwardly bent portion e^1, adapted when the hook is up to engage the lower side of a piece of insulation e^2. This piece of insulation is rigidly secured to the upwardly bent side portion c^1 of the bracket plate. This construction limits the downward motion of the spring *E*. The end e^3 of spring *E* is forked, and between the two limbs passes the end portion of spring *F*, which, when the hook is up, also bears upon the under side of the insulation e^2 The operation of the device will be evident from an examination of the accompanying illustration.

TELEPHONE SYSTEM.

Harry G. Webster, Chicago, Ill., patents (No. 839,910; dated January 1st, 1907; filed December 12th, 1902; serial No. 134,897) and assigns to the Kellogg Switchboard & Supply Company, Chicago, Ill., a telephone system.

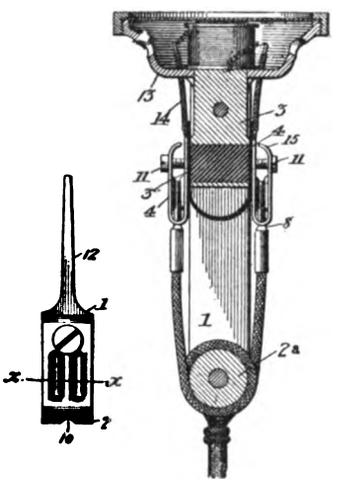
When the receiver is removed from the hook current passes through line relay *R*, which when energized causes the line signal



to appear. The operator then inserts answering plug *P* in the answering jack *J*, with the result that the battery *B* is included in a local circuit with cut-off relay R^2, which may have a resistance of 1500 ohms. This cut-off relay is adjusted to respond to a current over this path even though it be shunted by line conductors. Its operation cuts off ground branch 11, and also opens the local circuit of the line lamp *S*. The line relay is now shunted by supervisory relay *r*, and opens the circuit of signal *S*. Sleeve relay r^3 is adjusted to respond to current flowing through it whether or not the subscriber's line is open, so that it is energized over the same path as the cut-off relay R^2 and closes the local circuit of supervisory signal S^2. This lamp does not light, however, on account of the operation of tip relay *r*, which serves to open this circuit. Supervisory relay *r* is adjusted to respond only to current flowing through it when the subscriber's instrument is in use, so that as soon as he hangs up his telephone it is deenergized and the lamp is lighted. A busy test is obtained by the operation of test relay r^5 over a circuit controlled by springs of the supervisory relay r^4.

BINDING POST.

Ray H. Manson, Elyria, O., patents (No. 838,260; dated December 11, 1906; original application filed August 3, 1904; serial No. 219,567; divided and this application filed November 11,



1905; serial No. 286,880) and assigns to the Dean Electric Company, Elyria, O., a binding post.

This patent covers a binding post which may be stamped from sheet metal, and which is specially applicable to a telephone receiver such as that described in the present inventor's patent Serial No. 219,567, of which the present application is a division. It covers the construction and method of mounting and using a binding post, the features of which will be sufficiently evident from an examination of the accompanying drawings.

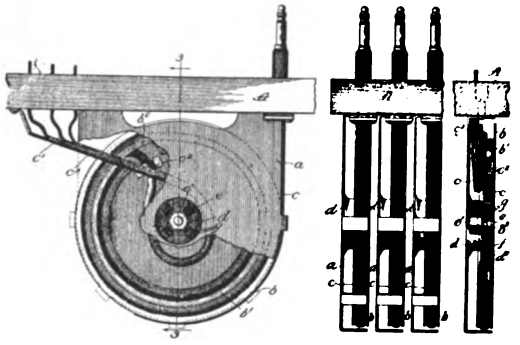
SWITCHBOARD CORD REEL.

Edward B. Craft, Chicago, Ill., patents (No. 840,200; dated January 1st, 1907; filed February 13th, 1906; serial No. 300,881) and assigns to the Western Electric Company, Chicago, Ill., a switchboard cord reel.

The object of this invention is to provide a device for holding a switchboard cord when not in use. In the apparatus is a sheave *b*, which is rotatably secured in frame *a*. The cord passes around this sheave and through an opening b^3 in the flange, being fastened at c^3 near its fixed end c^1 to the side of the sheave. The idle portion c^3 of the cord is wrapped around a drum *d*. This

Digitized by Google

drum is of less diameter than the sheave, so as to provide space for the flop of the idle portion of the cord as the cord is removed and restored. A chamber *f* is adapted to contain the mechanism, preferably consisting of a helical spring *g*, for operating the sheave. This spring is connected at one end with one of the lugs d^1, and at the other end with hub b^3 of the sheave. A feature in connection with the use of the device that is mentioned in the patent is that it lends itself readily to use above the switchboard, where it may be mounted on a shelf, so that the operator may draw the cords down instead of up in making a connection.



SOUND SENSITIZER.

Marcus Frank, Cincinnati, O., patents (No. 836,674; dated November 27, 1906; filed September 13, 1906; serial No. 334,544) a sound sensitizer.

The object of this invention is said to be "to render the transmission of sound to the ear clearer and more distinct by increasing the volume of sound." The inventor believes this can be accomplished by enclosing feathers in a small bag to be placed over the ear piece of the receiver.

TELEPHONE RECEIVER SWITCH.

James McMahon, Oakdale, Cal., patents (No. 836,202; dated November 20, 1906; filed July 24, 1906; serial No. 270,988) a telephone receiver switch.

A switch mechanism, to be located within the receiver instead of in connection with the hook, is described. Mounted between the limbs of the receiver magnet is a combination of switch springs, suitably insulated from one another. The longest of these springs is movable, and adapted to control the contacts Its free end is attached by means of a pin to the front end of a lever, which is pivotally secured at the end nearer the neutral point of the magnet, working in a slot cut in the receiver case. When the receiver is grasped in the hand this lever is forced inward until its surface lies within the circumference of the receiver surface, and when thus displaced effects the changes in positions of the switch springs which are necessary to complete the talking circuit.

SEMI-AUTOMATIC TELEPHONE SYSTEM.

Arthur T. M. Thomson, London, England, patents (No. 12,565; reissued November 20, 1906; original No. 809,232, dated January 2, 1906; application for reissue filed May 2, 1906; serial No. 314,898) a semi-automatic telephone system.

The object of this invention is to provide a telephone system in which the subscribers' lines terminate upon spring jacks in a switchboard. Associated with each spring jack is a calling lamp and a clearing out lamp. In the operation of the system when the calling lamp is lighted a "calling" operator inserts a plug into the subscriber's jack. The act lights a supervisory lamp on a second plug before a second operator, known as the "called" operator, and sets in motion mechanism which has been set by the subscriber whose station is equipped with special apparatus, which causes the number desired to be transmitted over the line, and indicated upon a suitable device at the switchboard. The "called" operator thereupon inserts a "called" plug corresponding to the supervisory lamp which she sees lighted, into a spring jack bearing the number displayed upon the indicator, which is that of the called subscriber. Bells for both "calling" and "called" subscribers are thereupon automatically caused to ring. When the subscribers have completed a conversation, and hung up their telephones, a clearing out signal is given by the illumination of the clearing out lamp associated with the jack of the calling subscriber. The "calling" operator disconnects, and in so doing transmits a disconnect signal to the "called" operator, who completes the clearing out of the connection. The system is described somewhat in detail, reference being made to no less than 33 separate drawings.

APPARATUS FOR TREATING THE BUTT ENDS OF POLES.

John T. Logan, Texarkana, Texas, patents (No. 836,592; dated November 20, 1906; filed March 13, 1906; serial No. 305,865) an apparatus for treating the butt ends of poles.

This device consists of an open top vat into which poles may be set endwise with butt ends down. After being so placed they are to be surrounded with creosote, which may be heated by steam let into the vat from a boiler through suitably disposed pipes. Means are provided whereby, when the butt ends of the poles have been heated sufficiently to expand all the air in the cells, the hot creosote may be suddenly let out of the vat, immediately after which cold creosote is allowed to flow in. The change in temperature will cause the rarefied air in the cells of the wood to contract and draw in the cold creosote.

CORD CIRCUIT.

W. W. Dean, Chicago, Ill., patents (No. 834,272; dated October 30th, 1906; filed December 29th, 1902; serial No. 137,001) and assigns to the Kellogg Switchboard & Supply Company, Chicago, Ill., a telephone system.

In certain telephone systems, where cut-off relays and other auxiliary devices are connected with one side of the telephone line, a connection between two such lines is unbalanced. The object of this invention is to provide a cord circuit which will insure a balanced condition during conversation. This is accomplished by cross connecting the strands of the cord circuit, so that the tip of one plug is connected through to the ring of the other plug, and vice versa. The separating of the two portions of the cord circuit for signaling purposes is accomplished through the use of separate sets of supervisory relays for each half of the circuit, and the use of condensers between these sets of relays, in the usual manner.

WIRE CABLE CLAMP.

John H. Cook, New York, N. Y., patents (No. 838,500; dated December 11, 1906; filed October 21, 1901; serial No. 79,352) and assigns to Henry B. Newhall, Plainfield, N. J., a wire cable clamp.

This clamp is composed of a back *A*, preferably made of cast iron, into which are rigidly secured, by casting, bolts *B*. A cover, A_1, also cast, is formed with three holes, provided at their inner ends with countersunk enlargements, so that the cover may be readily put in place on bolts *B*. Grooves A_3 and A_4 extend along the length of the clamp on either side of the centre, these grooves being in both back and cover. As shown in the drawing, at the central portion of the clamp the grooves extend equally into both cover and back, but near the ends the grooves are formed principally in the back. This curved form of the grooves is claimed to give the clamp a better grip upon the cable, since the latter is wedged into their deeper portions. The grooves are provided at intervals with gripping projections, A_6, formed at angular intervals of 90° around the interior surfaces, and preferably of pyramidal or diamond contour.

TELEPHONE SYSTEMATIZING DEPT.

5 and 7 PEARL STREET (EAST), GRAND RAPIDS, MICH., U. S. A.

THE VALUE OF A MEASURING INSTRUMENT

Suppose you have a line in trouble—grounded or open. You don't know the exact location, but you send out a troubleman to hunt it up and clear it. It may take him an hour or a day. Meanwhile the subscriber is getting hot under the collar and saying things about telephones in general and yours in particular.

If you have a Pignolet voltmeter or volt-ammeter you can determine the approximate location and also get an idea of the nature of the trouble. With the information your troubleman can find the fault in jig time, and you will have prevented the subscriber kicking by giving him service at the earliest possible moment.

Does it pay to be informed? You ought to know.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit

78 CORTLANDT ST., N. Y.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

PRACTICAL TEST OF WOOD PRESERVING COMPOUND.

THE Carbolineum Wood Preserving Co., 126 Reed street, Milwaukee, Wis., has recently received from one of its customers the following letter:

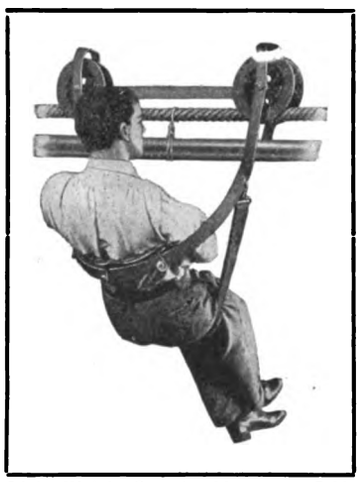
"Six years ago in rebuilding one of our trestles we coated half of the work with Avenarius Carbolineum in order to demonstrate its advantages. The timbers that were coated, at this time, are in as good condition to-day as the day they were put in. Those that were not coated were found this spring to be rotten and unsafe and were replaced with new timber. We performed this same experiment in similar work four years ago, with practically the same result. The timber not coated at that time shows considerable rot, while the other is as good as new. Three years ago we decided to use Avenarius Carbolineum on all new work and we think we will be amply repaid.

"BRIER HILL IRON & COAL CO., Youngstown, O.
"R. C. STEESE, Supt."

This compound is being extensively used by telephone companies, and is said to make the poles to which it is applied last several years longer than those which are untreated.

A NEW MESSENGER CABLE CAR.

AMONG the many new "good things" that the F. Bissell Company, of Toledo, O., is putting on the market is an improved messenger cable car, a cut of which is herewith given. This car is not only lighter than former cars, but it has several new features. The lightness of the car, the weight being only 28 pounds, enables one man to handle it with marked dexterity, while former cars, because of the great weight, have been more difficult for one lineman to handle. Light malleable wheels are provided with deep wide grooves that permit the car to be very easily moved over the cable hooks. The most noteworthy feature of the new cable car is the manner in which the lineman is carried. In the old style cars a lineman is carried directly under the cable, the operator being carried with face looking straight up or down the line. In working he is usually compelled to "dodge" from one side to the other under the cable. With Bissell's new car the lineman may be seated on either side of the cable, while a safety back strap permits him to work easily with both hands. This back strap is provided with a cushion back rest, as seen in the cut, which makes the strap easy on the back and also acts as an insulator. The lineman is thus brought in direct view from a side position, while the strap may be lengthened or shortened to give other advantageous positions. In every way the new contrivance has so marked superior points over many old style cars as to make it welcome among those who have to do such hazardous work as is often necessary on aerial cables.



Light Weight Security Messenger Cable Car.

DECISION ON PROTECTIVE APPARATUS PATENTS AFFIRMED BY COURT OF APPEALS.

THE decision of the United States Circuit Court, giving to the Sterling Electric Company, of Lafayette, Ind., the exclusive right to U. S. Patent No. 641,373, on protective apparatus, has recently been affirmed by the judges of the United States Circuit Court of Appeals. This decision covers nine other patents, upon which were brought separate suits which were to be determined by the decree on the suit which was tried. The Sterling Electric Company has announced its intention of restraining the appellant, Frank B. Cook, from the further manufacture of apparatus under these patents, and of demanding an accounting for all such apparatus which has in the past been made and sold.

NEXT WEEK'S ELECTRICAL SHOW AT CHICAGO.

CHICAGO'S Electrical Trades Exposition has become an annual event. Long before the close of the first show of a year ago more than one-half of the exhibitors expressed their approval by contracting for space in the coming show, and all the remaining available space on the main floor of the Coliseum has now been taken. Under the direction of Managing Director Homer E. Niesz there has been sold for the coming show 25 per cent more space than was occupied a year ago, the number of exhibitors is proportionately larger, and while all the larger concerns represented a year ago are still in the list, there are many big firms in the 1907 show that were missing a year ago.

No effort or expense has been spared that will tend to make the exposition attractive to the general public as well as those directly or indirectly interested in the allied electrical trades or interested as exhibitors. Ellery's Band will furnish attractive musical programs every afternoon and evening, and scores of interesting things have been prepared to offset in a measure the "trade" aspect of the show. The show will open Monday night, January 14, and will run from 10:00 A. M. to 11.00 P. M. every day but Sunday until January 26. The opening will be a formal affair, largely by invitation. Throughout the two weeks there will be several special days and a number of conventions and meetings. Thursday, January 17, will be the anniversay of the birth of Benjamin Franklin, and in honor of this event handsome souvenirs will be distributed. Wednesday, January 16, the annual meeting of the Northwestern Electrical Association will be held, continuing Thursday and Friday. Wednesday night, January 16, the Sons of Jove will have a rejuvenation, and many officers and members of the order from various parts of the country will attend to assist in the initiation of several new candidates. Monday, January 21, has been designated as "telephone" day, when appropriate souvenirs will again be distributed. Wednesday, January 23, is another souvenir event —Thomas A. Edison day. The American Electrical Salesmen's Association will meet Thursday, January 24, and the Illuminating Engineers' Society is scheduled to meet Thursday evening, January 17.

It is said that the majority of the exhibitors in this year's show have made elaborate arrangements in the preparation of their booths and dispiays. Should this be uninteresting to the general public—and this is next to the impossible—then there will be plenty to divert the mind from the "trade" show. Prof. W. J. Clarke, of Mt. Vernon, N. Y., who entertained thousands of people at the electrical show a year ago with his demonstrations, has been engaged for this year's show. Prof. Clarke has many new and wonderful things to show, including highly perfected moving pictures, preceded by a set of mechanical slides that demonstrate that "moving" pictures do not move at all, and that the effect is simply an optical illusion. Prof. Clarke will also demonstrate electrical welding, wireless telephony, the loud-speaking telephone, the talking arc lamp, the X-Ray and Tesla's high frequency experiments.

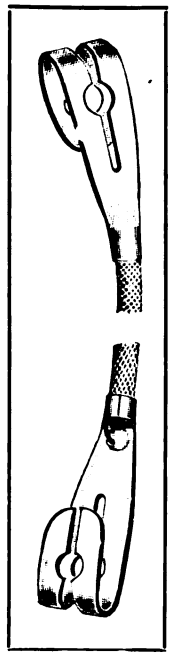
IN THE MANUFACTURING FIELD

Perhaps the most wonderful of the inventions to be demonstrated will be the long distance test of Dr. Cahill's telharmonium. The greatest distance that the music of this marvelous instrument has been transmitted has been in the vicinity of 100 miles. Consequently the effort to transmit it from New York to Chicago will be watched with no little interest. The music will be furnished from the instruments of the New York Electric Music Company over the wires of the American Telephone & Telegraph Company through the office of the Chicago Telephone Company.

THE P. D. BATTERY CONNECTOR.

AS a device capable of being used for making good and reliable connections between the terminals of dry cells the P. D. battery connector seems to be worthy of careful attention from battery users. The appearance of the device will be evident from an examination of the accompanying illustration. It is fitted in place by simply pushing it on the binding post, and once installed it appears to give as good contact as could be desired. The carrying capacity of this contact is insured by the resilience of the turned over points, which give an even bearing on both nut and shoulder, and also by the firm grip secured on the binding post itself. The open slot, which makes it unnecessary to remove the nut to make a connection, is a very convenient feature of this device.

The connecting strand between the two terminals is made up of tinsel covered with braided insulation, so that an ample carrying capacity in a durable conductor is assured. These connectors have been given a thorough trial in automobile work, where they are said to have given excellent satisfaction. As under such conditions they are exposed to especially exacting requirements, including a vibration which tends to decrease the reliability of contacts, it is expected that they will amply fulfill the requirements of telephone service. The company will be pleased to give further information, or a sample, to interested persons.



The PD Battery Connector.

THE SWEDISH-AMERICAN TELEPHONE COMPANY, Chicago, Ill., has prepared for distribution a pamphlet containing reproductions of a large number of very interesting testimonials to the efficiency of its telephone apparatus. These come from operating men in the Middle West and all speak of the very satisfactory service which is being given from instruments and equipment manufactured by this company. It will be pleased to send copies of this booklet to interested persons.

THE JONAS BATTERY COMPANY, of Toledo, O., capital $150,000, was recently incorporated by J. N. Bick, A. W. Bick, L. M. Fox, H. F. Bossard and Marion Bossard. The company will manufacture a special dry battery for telephone service.

MR. H. C. BARBER, of Pittsfield, Mass., for several years employed by the Stanley Electric Company, has resigned to accept the position of superintendent of the Trumbull Electric Manufacturing Company, of Plainville, Conn., manufacturers of the well known Trumbull switches.

THE B-R ELECTRIC & TELEPHONE MFG. COMPANY, Kansas City, Mo., has recently been incorporated in Oklahoma, in order that it may have all the advantages to be derived from such an incorporation in carrying on its business in that territory. J. C. Walton, of Oklahoma City, has been named as territorial agent for the company.

THE MONARCH ELECTRIC & WIRE COMPANY, Chicago, Ill., opens the new year with the announcement that, as Mr. S. Mankowitz will be no longer connected with the company, the management will henceforth be under the personal supervision of the following officers: Louis A. Schwab, president; Henry Schwab, vice-president and secretary; N. Deutsch, treasurer. These three gentlemen have all been connected with the company for many years, and will be assisted by an able staff, the members of which will have charge of the various departments. This will place the company in a better position than ever to take care of its constantly increasing business.

THE AUTOMATIC ELECTRIC COMPANY, Chicago, Ill., reports that at present it has nearly $7,000,000 worth of orders on hand to be filled. These include some large plants, Denver, Omaha, San Francisco and Chicago being among the number. So much has its business grown during the past year that the factory has been more than doubled in size and trebled in capacity by a new addition which will be available within a short time.

During the past year the Automatic Electric Company issued and sold the last $1,000,000 of its $5,000,000 capital stock, to provide additional working capital for its increased business.

Perhaps the most important contract which the company will handle this coming year will be for the 100,000 line exchange to be built in Chicago by the Independent Telephone Company of Chicago, a $10,000,000 corporation, which has been formed by some of the leading financiers in the Independent movement.

The greatest development of the automatic business the past year has been on the Pacific Coast. Contracts have been made during the past year for automatic plants at San Francisco and Oakland in California, at Portland, Oregon, and at Spokane, Tacoma, Bellingham and Walla Walla, Wash., as well as for large additions to the Los Angeles automatic system.

THE W. G. NAGEL ELECTRIC COMPANY, Toledo, O., has a considerable number of interesting articles in the January number of its *Electrical Times*. There are two pages of useful electrical and mechanical tables, and an especially interesting feature is a two-page article upon the method of using the Hercules anchor sold by this company. The usual current price summary is included in this issue. Copies will be sent free of charge by the company upon receipt of applications.

THE BLAKE SIGNAL & MFG. COMPANY, 246 Summer street, Boston, Mass., reports that large sales of its well-known insulated staples, and Blake Compressed Cleats are now being made to the smaller telephone companies. These companies are beginning to realize, as the larger companies did some time ago, that although the first cost of insulated staples is greater than that of bare staples, their use finally results in a decided economy, as the interior wiring upon which they are used is far less likely to be subject to short circuits, grounds and other troubles than that held in place by insulated tacks.

THE PIERRE ELECTRICAL & NOVELTY SUPPLY STORE has recently started in business at Pierre, S. D. It is prepared to handle all sorts of electrical supplies.

The business is managed by Walter S. Rowe, formerly owner of the Capital City Telephone Company's exchange at Pierre. He will be pleased to hear from all intending purchasers of electrical supplies in his part of the country.

THE WEEK'S MESSAGES

NEW COMPANIES.

EL PASO, ILL.—Articles of incorporation have been filed by the Pleasant View Telephone Company, of El Paso. The company has an authorized capital stock of $800 and the incorporators are A. W. Shepard, W. H. North and W. G. Stokes.

TULSA, I. T.—A number of Chicago and Tulsa capitalists have made application to the city council for a franchise for an Independent Telephone Company. The new company, if the franchise is granted, promises much lower rates.

JEFFREY, KY.—The Peters Creek Telephone Company, of Monroe County, has been incorporated with a capital stock of $200. Among the incorporators are W. H. Smith, P. L. Samson and James Moore, of Jeffrey.

BETHEL, ME.—The Greenwood Telephone and Telegraph Company has been organized at Greenwood, for the purpose of constructing and maintaining telephone lines in Greenwood, Woodstock and Bethel, in Oxford county. The company has a capital stock of $2,500, and the officers are: President, E. L. Tebbets, of Auburn; treasurer, E. P. Farrington, of Greenwood.

BREWSTER, MINN.—The Brewster-Round Lake Telephone Company, of Brewster, has filed articles of incorporation. The capital stock is given at $20,000 and the incorporators are F. R. Geyerne, C. R. West and A. L. Wells, Brewster C. Nienaber, T. Bahis, Round Lake.

ROCKWOOD, MINN.—Articles of incorporation have been filed by the Farmers' Telephone Company, of Rockwood. It has an authorized capital stock of $10,000, and among the incorporators are D. W. Thurston, Isaac Foster and C. B. Barnes.

CARTHAGE, MO.—The farmers in the neighborhood of Carthage, Mo., have organized an Independent telephone company with the following officers: President, Leslie Smith; secretary, Benjamin Jones; treasurer, Peter Wakefield; superintendent, Harry Waddell.

NEMAHA, NEB.—The Farmers' and Merchants' Telephone Company, of Nemaha, has filed articles of incorporation. The company is capitalized at $25,000, the shares having a par value of $25 each. The corporation is to have a life of fifty years, and the liabilities are limited to $5,000. The following directors have been elected: M. W. Knapp, William Maxwell, John Crother, Henry Seid, Rufus Rowen, J. I. Webber, W. W. Seid, Earl Gilbert, J. E. Crother and others.

RICHMONDVILLE, N. Y.—The Richmondville, Seward & Sharon Telephone Company has been incorporated with a capital stock of $3,000, and the following directors have been elected: O. R. Mann, Richmondville; Virgil Winnie, Seward, and J. E. Preston, Sharon Springs.

OKLAHOMA CITY, OKLA.—Articles of incorporation have been filed by the Canadian Valley Telephone Company, of Oklahoma City. The incorporators of the new company are Lewis Rockwood, B. F. Dougherty and R. Schunemann and its capital is placed at $500.

CENTERVILLE, S. D.—A consolidation of the Ege and Riverside telephone exchanges has been effected. Centerville has been selected as headquarters by those who have incorporated a company for the consolidation of the two systems. The company has been incorporated under the name of the Centerville Telephone Exchange Company, with an authorized capital stock of $50,000 and a paid up capital of $26,000. The incorporators of the new company are Frank R. Dirks, Fred Krause, W. J. Henrich and Charles Prinslow.

KARLSBURG, WIS.—The Burnett County Telephone Company, of Karlsburg, has been incorporated with a capital stock of $1,000. Among the incorporators are A. J. Myrland, S. Lundquist, P. J. Peterson and F. L. Peterson.

FRANCHISES.

BERKELEY, CAL.—Despite a great deal of opposition, the Home Telephone Company has succeeded in obtaining a franchise in Berkeley, the sum paid to the trustees of Berkeley for such franchise being $47,000.

GRANGER, MO.—The Farmers' Telephone Company, of Dallas Center, has applied for a franchise to construct and operate a telephone exchange at Granger.

NEW MEMPHIS, TENN.—The Looking Glass Prairie Telephone Company has been granted a franchise by the Village Board of New Memphis and will soon commence the construction of its system at this place.

PULLMAN, WASH.—A twenty-year franchise has been asked of the city council of Pullman, Wash., by the Inland Telephone Company.

STRATHCONA, ALB., CAN.—The franchise recently applied for by the city of Edmonton at Strathcona has been granted. Address Mayor Davidson, Strathcona, or City Engineer Keely, Edmonton, Alberta.

FINANCIAL.

RICHMOND, IND.—The Richmond Home Telephone Company has increased its capital stock from $150,000 to $400,000.

TROY, N. Y.—The Commercial Union Telephone Company has declared a semi-annual dividend of three per cent, payable January 2.

NEWARK, OHIO.—At the regular meeting of the directors of the Newark Telephone Company the quarterly dividend of two per cent was declared on the common stock, and three per cent semi-annual dividend on the preferred stock, payable January 1. Owing to the increased business of the company it will be necessary to install a new switchboard.

NEW CASTLE, O.—The New Castle Telephone Company, New Castle, O., has increased its capital stock from $5,000 to $10,000.

CORSICANA, TEXAS.—The capital stock of the Corsicana Telephone Company has been increased from $50,000 to $100,000.

COMBINATIONS.

CAIRO, ILL.—Arrangements have been perfected by which a consolidation will be effected between the Cairo Telephone Company and the Central Home Telephone Company, the latter being the new long distance company. This merger will give the subscribers to the Cairo exchange long distance connections. The name of the new company will be the Home Telephone Company, and H. R. Alsthorpe will be president. Among the many improvements planned by the owners of the company are the erection and equipment of a new exchange, and the extension of its lines in many directions.

ALMOND, WIS.—The Almond Telephone Company has recently acquired the Plainfield lines, and now owns and controls lines from Almond to Stevens Point, Plainfield, Hancock, Wautoma, Wild Rose and Waupaca, besides a great number of farmers' lines.

TORONTO, ONT., CAN.—The Stark Telephone, Power and Light Company has purchased the Erindale Power and Telephone Company for $47,500.

ELECTIONS.

COLUSA, ILL.—The Colusa Telephone Company, Colusa, Ill., has elected the following officers: R. T. Wooley, president; C. F. Boyd, vice-president; L. L. Newton, secretary; Thos. Shaw, treasurer. It is the company's intention to erect a new exchange building.

MIDDLETOWN, ILL.—The following directors have been elected by the Middletown Mutual Telephone Company: Gilbert Gunsten, Middletown; H. A. Binns, Middletown; William Behrens, Greenview, and A. L. Dalton, Middletown.

FREETOWN, IND.—The following officers have been elected by the Freetown Telephone Company: President, C. R. Mann; vice-president, Calvin Bowman; secretary, Walter Harbaugh; treasurer, Albert De Long; superintendent, H. H. Tinch.

SPENCER, IOWA.—The following officers and directors have been elected by the Northern Rural Telephone Company, of Spencer, Iowa: President, Harry Heikens; vice president, B. D. Dunning; secretary, G. W. Greaves; treasurer, L. B. Peeso; superintendent, E. C. Starks; directors, J. T. Goldsworthy, L. C. Anderson, J. C. Johnston, J. L. Berkholder, Fred James and M. Doty.

COXSACKIE, N. Y.—The Upper Hudson Telephone Company has elected the following officers: President and treasurer, A. A. Gardiner; first vice-president and secretary, Harrie McK. Curtis; second vice-president, Alberti Baker; collector, Wakley Best.

NEWS—WANTED

THE matter contained upon the message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

BATTERIES WITH BRAINS

Not that Nungesser Batteries have brains, but that it takes brains to make them.

Brains trained through nineteen years' experience, studying the many problems of battery manufacture, give to the "1900" Dry Battery a superiority that is best attested by its extensive and ever-increasing use in all parts of the world where dry batteries are used.

If the name NUNGESSER is on your dry batteries you may be sure they are right, and yet it costs you no more to get this stamp of excellence and the good service that always goes with it.

THE WEEK'S MESSAGES

EAST HANOVER, N. Y.—The officers of the East Hanover Telephone Company are: A. S. Rank, president; Wm. Gerberich, vice-president; J. R. Mader, secretary; treasurer, Samuel Fry.

WATERFORD, ONT. CAN.—The Norfolk County Telephone Company has elected the following directors: S. L. Squire, P. G. Pearce, Waterford, Ont.; H. Barthelomew, county of Norfolk, Ont.

MISCELLANEOUS.

SULPHUR, I. T.—The telephone plant at Sulphur, I. T., has been acquired by O. O. Spencer and R. S. Goffe, who will make improvements in the system.

ST. JOSEPH, MICH.—Citizens who favor an Independent telephone system in competition with the Twin City Telephone Company, controlled by the Michigan State Telephone Company, have petitioned the common council to grant the franchise asked for by the Stromberg-Carlson Telephone Company, which would operate in this city and Benton Harbor. About 500 have signed this petition, and a few have signed a petition asking the council to shut out the competition. Benton Harbor council voted to grant a franchise in that city, but the mayor vetoed the franchise, and it will come up to the council for passage over the mayor's veto.

TOLEDO, O.—The Toledo Home Telephone Co., of Toledo, O., reported that during the holiday season contracts were signed for telephones to be furnished as presents for quite a number of people.

WAYNESBURG, PA.—The Greene County Telephone Company has made arrangements with the Farmers' Mutual Company to use their poles from Washington to Amity, and with the Ruffs Creek Company from Amity to Waynesburg.

PERSONAL.

O. F. FRENCH, formerly general manager of the Cuyahoga Telephone Company, of Cleveland, has recently taken the position of managing engineer with the National Engineering Corporation ,of Baltimore, Md.

D. P. GEMMIE, formerly manager of the Crest exchange of the Cuyahoga Telephone Company, has accepted the position of manager of the Gallipolis Telephone Company, Gallipolis, Ohio.

J. K. JOHNSTON, general manager of the Tuscarawas County Telephone Company, New Philadelphia, O., has recently been appointed general manager of the Sandusky Telephone Company, Sandusky, O., which position he will hold in addition to the one at New Philadelphia. The Sandusky Telephone Company proposes to make some changes in its switchboard and to put up about 20,000 feet of aerial cable, making improvements to the extent of about $25,000 to $30,000. When this work is completed the Sandusky company is expected to make rapid advances.

E. D. KRAMER, formerly traffic manager of the U. S. Telephone Company of Ohio, has resigned and will go into business in his home city of Dayton, Ohio.

H. E. PLUMMER resigned the position of superintendent of exchanges with the Cuyahoga Telephone Company, Cleveland, O., on January 1 to accept the position of traffic manager with the Louisville Home Telephone Company, Louisville, Ky. Mr. Plummer will have charge of both operating and maintenance.

New Construction in the Field

DECATUR, ALA.—A telephone cable is now being laid across the Tennessee River by the new Independent Long Distance Telephone Company, which will give subscribers in Decatur connection with the principal cities of the North. The Independent company now has connections between Decatur and Birmingham and intermediate points and is extending its lines to the south of Birmingham into Mobile and New Orleans. The company owns city telephone systems in the Decaturs, Birmingham, Mobile, Nashville, Louisville and many other cities and is extending its local and long distance service all over the South and North.

JONESBORO, ARK.—Considerable construction work is being conducted by the Home Telephone Company on its plant at Jonesboro.

CLAYTON, ILL.—The Home Telephone Company, of Quincy, is to build lines to Clayton and establish an exchange there. It is the company's intention to offer first-class service in competition with the Bell company.

CLINTON, ILL.—Lines are being constructed by the National Telephone and Electric Company to Kenney, Wyanesville, Beason and Lincoln.

HOLLOWAYVILLE, ILL.—The lines of the Farmers' Mutual Telephone Company are being extended in many directions.

RISING SUN, IND.—The Farmers' Telephone Company, of East Enterprise, is building a line to connect with the exchange at Rising Sun.

TERRE HAUTE, IND.—A private telephone system has been installed by the Vandalia Railroad. It is the road's intention to effect a connection with the Citizens' Company.

CENTERVILLE, IA.—The Boone County Telephone Company, of Boone, contemplates the extension of its lines to Centerville.

MASON CITY, IOWA.—The Albert Lea Telephone Company is extending its lines in Mason City.

SPENCER, IOWA.—The Northern Rural Telephone Company, of Spencer, Iowa, which now has over 1,200 farmers' telephones in Clay county, contemplates the installation of a new central energy exchange at Spencer to replace its present magneto system. Many other improvements will also be made in its rural lines.

CRISFIELD, KAS.—Lines are being erected between Crisfield and Attica by the Crisfield Telephone Company. In all about fifteen miles of new lines will be built.

LIBERTY, KAN.—A new switchboard has been installed by the Liberty Independent Telephone Company, and other improvements are contemplated.

LUDINGTON, MICH.—Many improvements are being made in the system of the Lake Shore Telephone Company at Ludington.

AURORA, MINN.—A new exchange is to be installed at Aurora, Minn., by the Mesaba Telephone Company, of Mesaba.

WINONA, MINN.—The Winona Telephone Company is making many extensions in its lines.

HUME, MO.—Among the many improvements planned by the Hume Telephone Company is the installation of a new switchboard at Hume. It is the company's intention to also establish an exchange at Foster.

HELENA, MONT.—The Montana Independent Telephone Company, with headquarters at Butte, Mont., is to install a new plant at Helena, which it is estimated will cost in the neighborhood of $175,000. It is also the company's intention to establish an exchange at Anaconda.

UNADILLA, N. Y.—Many new lines are being built by the Unadilla Telephone Company at New Berlin.

NAPOLEON, OHIO.—The Home Telephone Company is rebuilding part of its system at Napoleon, and expects to make its plant strictly up-to-date in every particular.

YORK, PA.—The York Telephone Company has under consideration the erection of a new building in which to install its exchange.

COLUMBIA, S. C.—The Rural Telephone Company, of Columbia, S. C., has under consideration the extension of its lines to Littleton.

TOMBSTONE, TEXAS.—The Tombstone Telephone Company, which has built lines to Bisbee and Benson, expects soon to establish connections between Tombstone and all the principal towns and cities in Arizona.

COLOMA STATION, WIS.—The lines of the Coloma Telephone Company are being overhauled.

EAU CLAIRE, WIS.—New lines are being built by the Shaw Telephone Company of Eau Claire.

MILWAUKEE, WIS.—The Milwaukee Independent Telephone Company is to build lines throughout the state, touching as far north as Appleton.

OSSEO, WIS.—A line is being built from Osseo through the town of Clear Creek, Eau Clair County, by the Osseo Telephone Company.

EDMONTON, ALBERTA, CAN.—The public works department of the Alberta government is making arrangements for the construction of a public telephone line between Edmonton and Lloydminster, and is advertising for bids for the material required. Starting at Edmonton, the line will follow the general direction of the C. N. R., but the greater part of the way will follow the section and range lines. Every town on the railroad between Edmonton and Lloydminster will be connected with the system, and later on inland towns will be connected by branch lines.

UNDERGROUND.

MENDON, ILL.—The Mendon Telephone Company is placing some of its wires underground.

LAFAYETTE, IND.—The Lafayette Telephone Company has commenced its underground work at Lafayette.

RICHMOND, IND.—The Richmond Home Telephone Company is about to begin the laying of its underground cables.

DETROIT, MICH.—The City Council of Detroit has passed an ordinance requiring all wires to be placed underground within a mile circle in Detroit.

SPRINGFIELD, MO.—In the installation of the Springfield Home Telephone Company's plant at Springfield will be included considerable conduit work.

GREAT FALLS, MONT.—Considerable underground work is to be done by the Independent Telephone Company of Butte in the installation of its new system at Great Falls.

The Smallest Magneto Telephone

DIMENSIONS.

Width	5 inches
Depth	4 inches
Height	7¼ inches

The Wesco Long Distance Residence Telephone Model No. 51 is the smallest and most compact Magneto Telephone made.

It is especially designed for use in residences where wall space is limited and where ornamental design and beauty of finish are as essential as the efficiency of the working parts.

It is equipped with our Standard Receiver, Hook-Switch, Long Distance Solid back Transmitter, 80 ohm ringer and 3-bar Generator, each part being the best that money can buy. It is also made with 4-bar Bridging Generator with 1,000, 1,600 and 2,000 ohm ringer movement.

JUST A SUGGESTION

Take one of your busy 4-party lines and equip it with "POOLE" Lock-Outs. Leave it in service a month and then see how many of the four will stand a raise of $3.00 a year rather than go back to the old way. We know the answer, but we want your subscribers to impress on you the fact that the "POOLE" Lock-Out is a rate-raiser.

It won't cost you anything to try it, because we will loan you the Lock-Outs free and there is no other equipment required. Write today for our Booklet AL-2.

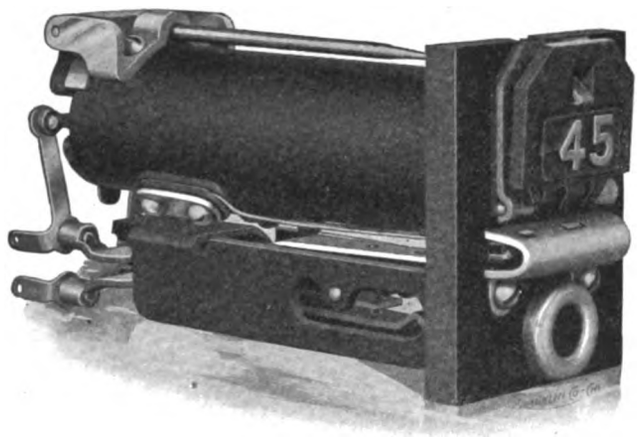
DEAN TELEPHONE APPARATUS

MAGNETO SWITCHBOARDS



Our combined drop and jack used in our express type switchboards is of the mechanically self-restoring type, having many novel and valuable features which are in keeping with other Dean apparatus.

The drop is of the large tubular type, having more turns of larger wire than other drops of this kind now on the market. This means higher impedance, less liability to break down of the winding and a more sensitive and powerful action.

The winding is removed without disturbing the magnetic circuit or adjustment of the drop mechanism. This makes the windings absolutely interchangeable so that they can be withdrawn and replaced in a few seconds without the least possible chance to go wrong.

The night alarm contacts are positive acting and are located in plain view, so as to be seen from the front of the switchboard—furthermore, they are platinum.

The cut-off springs in the jacks are also platinum pointed.

The restoring mechanism is simple and positive.

We have originated many other valuable details in magneto switchboard construction.

Our new Folder No. 6, a copy of which will be mailed free on request, describes in full many valuable features.

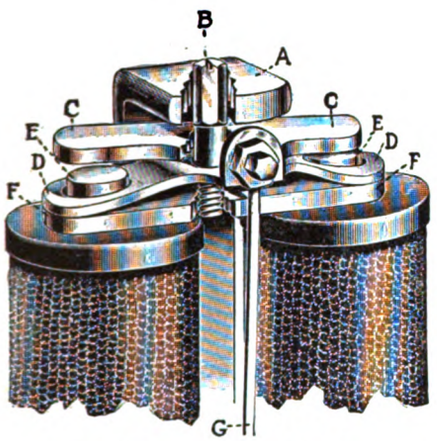
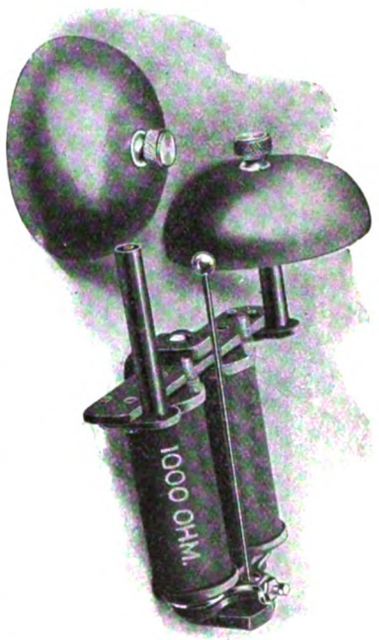
QUALITY—DURABILITY—EFFICIENCY

THESE features are essential and have made our self-contained Ringers famous. They are in use on all our Central Energy and Magneto Instruments. The permanent Magnet A is made of the finest grade of magnet steel, carefully tempered. The adjustment screw B is made of heavy brass which will perform its work without twisting. This screw is hexagon in shape and slotted, adjustment can thus be made by screw-driver or wrench. The armatures C and cores E are made of annealed soft iron. The plate which supports the armature is made of spring brass of sufficient thickness to possess the proper tension. The yoke F is of heavy brass, forced with great pressure over the cores E, holding them firmly in place. The adjustment of the Ringer is effected by turning the screw B, which has a shoulder resting on plate D, the lower end being threaded into plate F. Long life and perfect satisfaction are assured.



Showing Sectional View of Armature End



Complete Ringer

Do not fail to see our Exhibit at the Electrical Show, Chicago, Jan. 14th to 26th inclusive. We have some special features of interest to you.

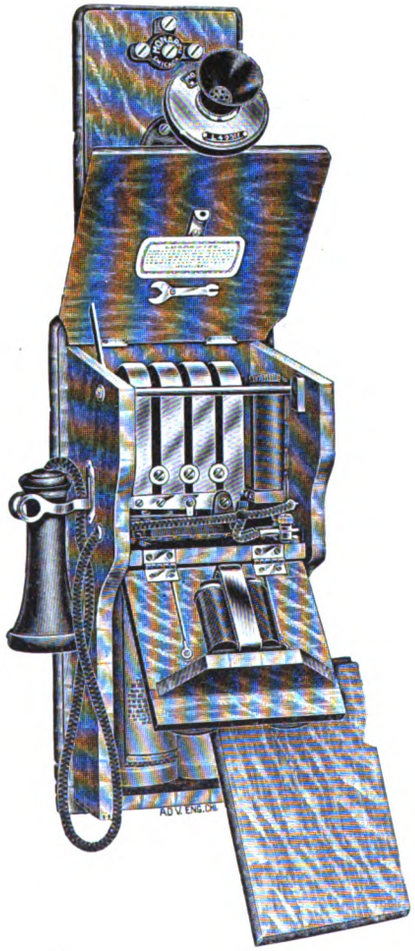
MONARCH



"Characteristics"

Monarch Telephones of all styles embody certain features which have come to be known as the "Monarch Characteristics." Perfect mechanical construction is the first and foremost. Every little detail is given the most careful consideration and the finished parts are naturally efficient and durable. Simplicity is another very desirable feature and is always noticeable in Monarch products. Convenience of assembly is given its share of study and consideration, with the result that every part can be removed easily and quickly.

The removable shelf in the telephone and the removable drop coil in the switchboard are two examples of this characteristic. Little appliances and conveniences to save time and annoyance are sought and when found are embodied in the apparatus. The gong damper on the compact telephone is one of these, which is appreciated by subscriber as well as operator.

There is a reason why Monarch Apparatus gives just the service desired. Study its characteristics and the reason is apparent. Catalogues will be sent upon request.

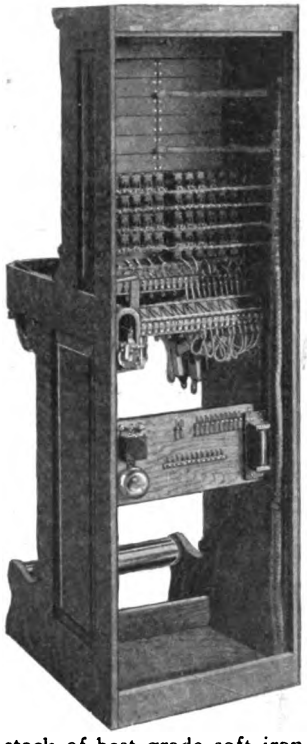
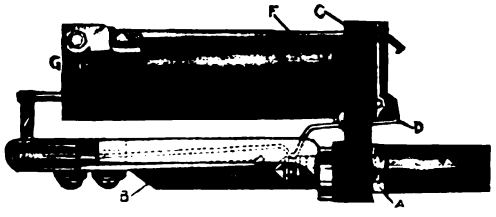
KELLOGG

TELEPHONE APPARATUS



Magneto Switchboards

CONTAIN THE KELLOGG SELF-RESTORING COMBINED DROPS AND JACKS



Our combined drop and jack which is used in all our Express type Switchboards is made up of a sensitive tubular drop mounted with a reliable spring jack on the same strip. The above view shows the drop with shutter restored after plugging in. The line or tip spring of the jack is sufficiently elongated to project through an opening in the mounting strip and by its rise, due to the insertion of the plug, restores the drop shutter. The upward movement of the tip spring opens contact with the local jack spring, thus cutting the drop winding out of circuit. This means of mechanically restoring the shutter is by far the simplest of any yet devised. No additional parts whatever are required to perform this operation.

THE DROP is of the tubular iron-clad type, machined from solid stock of best grade soft iron, protected from corrosion by heavy copper plating and oxidized. The armature and core are of the same grade of iron.

THE ARMATURE is supported on trunnion screws through the agency of a one-piece metal bridge, insuring extreme sensitiveness. The armature can not freeze to the core or shell, as the drop forces the lever down so that the catch will always engage and retain the shutter. Each tube is entirely insulated from the mounting strips and from the other tubes.

THE WINDING is best quality, silk-covered copper wire, insulated from all metal parts of the drop. The tubular part of the drop, including the winding, can be removed from the mounting independently from the jack without unsoldering any connections.

The only tool required is a small screwdriver.

EACH JACK consists of a rigid brass frame on which the German silver tip and local contact spring are fastened with hard rubber separators for insulation. The sleeve connection is a tubular screw with a hexagonal head. It passes through the mounting strip and is fastened to the jack frame by two pins. All connections are absolutely reliable and are easily removed when desired.

THE MOUNTING STRIPS are of sheet brass faced and backed with polished hard rubber. The drop shutters, attached to the front of this mounting, are provided with removable metallic number plates. Each drop will operate a night alarm contact when the shutter is in calling position. This does away with the unsatisfactory method of establishing night alarm contact through the hinge of the drop. With our construction we guarantee positive results.

Note the neat, even mounting of the drops and jacks in the cut of switchboard.

Write for "Bulletin No. 9A," which completely describes our Magneto Switchboards.

20 Pair Bank—No. 10.

Cook's No. 10 Protector

COOK'S No. 10 Protector is so radically different in principle and design from previously existing types of switchboard protective apparatus, and has so many vital points of improvement, that from an engineering standpoint, it belongs in a class by itself. The following features alone are enough to recommend it to every careful, conservative, conscientious telephone engineer:

1. *The heat coil is not made of wire; it cannot burn out or short circuit.*
2. *There are no loose contacts in the circuit.*
3. *There cannot be a defective coil in the circuit.*
4. *The springs of each pair are separated and insulated from all adjacent springs.*
5. *No bolt connections are used to transpose the line and the switchboard terminals; consequently there can be no loose connection in the circuit.*

Cook's No. 10 Protector is a resoldering but not a self-soldering protector.

It is mechanically and electrically simpler and better than *any* protector on the market.

16,000 pairs of No. 10 were installed at St. Louis main office—the largest single protector rack made.

Write for descriptive bulletin and prices.

Frank B. Cook.

MANUFACTURER,

238 West Lake Street, CHICAGO, ILL.

You Wouldn't Start a Horse Car Line

in this age of electric cars? Not if you wanted to make money out of the business of transportation.

Then why should you start a manual telephone exchange in this age of automatics, if you want to make money out of the telephone business?

The automatic system of telephony bears the same relation to the manual system that the electric car does to the horse car. It is the apotheosis of telephone development, as the electric car is of transportation development.

The automatic telephone system produces the best service more economically than indifferent service can be produced with manual equipment.

There is no more question as to the relative popularity of the automatic and manual telephone service where the two kinds are in competition than there is as to the relative popularity of the trolley car and the horse car.

And, as for the securities—the same comparison may be applied with the same results.

Our Automatic system has been adopted in the following cities:

Aberdeen, S. D.	Clayton, Mo.	Jonesboro, Ark.	Ocean Park, Cal.	Springfield, Mo.
Akron, Ohio.	Cleburne, Texas.	Lake Benton, Minn.	Pentwater, Mich.	St. Marys, Ohio.
Albuquerque, N. M.	Columbus, Ga.	Lewiston, Me.	Portland, Me.	Tacoma, Wash.
Allentown, Pa.	Columbus, Ohio.	Lincoln, Neb.	Portland, Ore.	Toronto Jct., Can.

An Unusual Accident to a Pole Line

By John Putnam.

(Illustrations from photographs by the author.)

TELEPHONE inspectors and trouble-men will talk by the hour of unusual or remarkable experiences that they have been through with the apparatus that came under their charge or about the telephone users with whom they have been in contact, the latter experiences, by the way, being mostly humorous. Linemen and construction men also have their share of such incidents, as this article will show.

The accident to be described happened on the morning of September 20, 1906, at North Haven, Conn., to a trunk line running from New Haven to Hartford. An examination of Fig. 1 will serve to make the situation clear. The caboose standing on the siding was on that morning attached to the rear of a freight train that was being backed into the spur track in order to leave a couple of cars. A brakeman stood at the hand brake of the caboose easily checking the speed of the train, as he supposed, when suddenly he noticed that the speed did not check after all. The train had broken in two and the lonely hand brake was not enough to check the momentum of several freight cars that came sailing into the siding. At the end of the track was the usual rotten wooden bumper and a fifty-foot chestnut telephone pole. The brakeman concluded that the stories of the captain standing on the sinking ship were mostly fiction anyhow, and started on a rapid trip to the village post office on the other side of the track. The train continued on its way, however, and after crashing through the bumper and telephone pole, came to a stop in front of a house at the right of the picture. The owner of the aforesaid house, contrary to the usual habit of property owners, is now of the opinion that telephone poles in front of residences are very desirable. Right of way men are welcome to this incident, and may be able to use it with convincing force in their business, for with the increasing use of automobiles house owners can never tell when it is safe to sit on the front stoop.

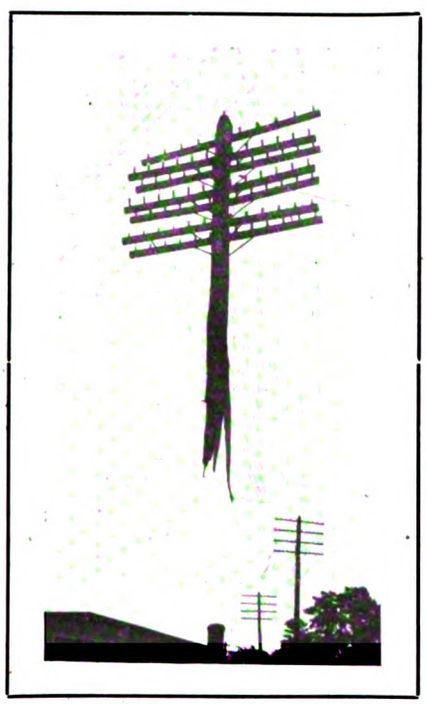

Fig. 2. A near view of the suspended pole top.

Strange as it may seem, only three pair of wires were crossed or broken out of the forty wires on the line. The pole top remained suspended in the air, held by the wires Fig. 2 shows how uncanny the pole top looked. Many readers have undoubtedly seen Kellar, the magician, perform a trick in which he places a beautiful woman with her head on one chair and her feet on another. Then, taking away the chairs, he leaves the young lady horizontally in the air and passes a hoop around her body. The only difference between this trick and our telephone pole top is that in the latter case one can see the wires.

The broken pole was side guyed to a tree, the pole end of the guy being visible to one who carefully examines the illustrations. This equalized the strain on the line.

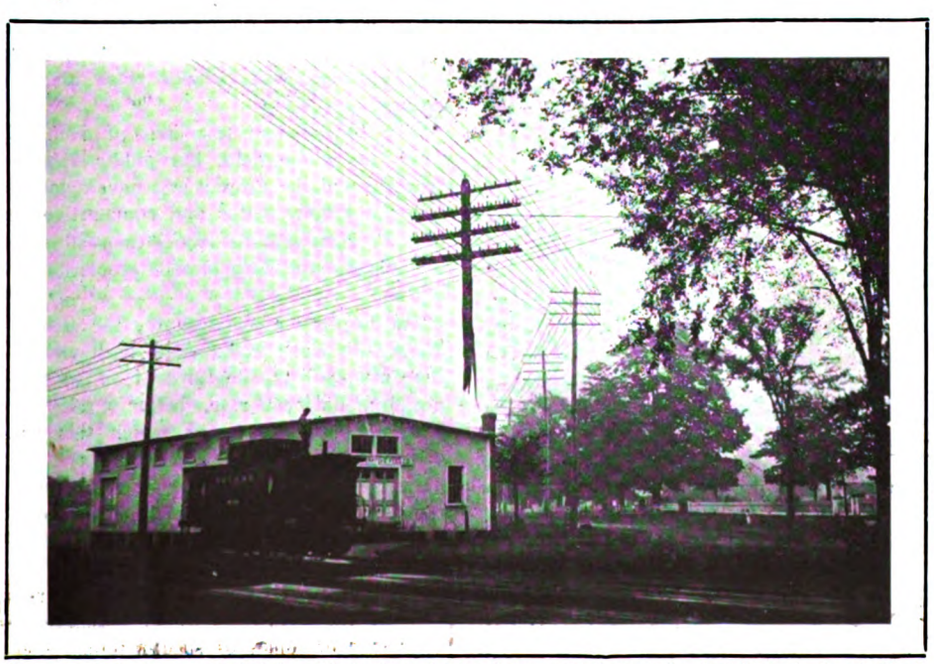

Fig. 1. Pole top suspended in mid-air, base having been carried away by freight train knocked off the track.

While making the photographs the photographer remarked to an interested small boy: "If the wires stay up like that, what is the good of poles? The telephone company could save money by not using them." The answer was a look of utter disgust at the writer's ignorance as the youngster replied: "Huh, I guess if the other poles had been busted the wires would 'a' come down all right."

The South Dakota Convention

THE fourth annual convention of the South Dakota Telephone Association was called to order Jan. 9th by C. B. Kennedy, of Canton, president of the association.

A roll call of members of the association showed that there was a good representation. After some discussion as to who should be allowed to be present at the meetings it was finally decided that all persons directly interested in Independent telephone affairs should be permitted to attend the open sessions, but that no representatives of the Bell interests should be permitted to enter.

In the absence of W. T. Doolittle, of Sioux Falls, who was scheduled to make the address of welcome, E. D. Morcom, secretary of the Citizens' Telephone Company of Sioux Falls, appeared. He heartily welcomed the delegates to the city, and assured them that the citizens of Sioux Falls would spare no efforts to make their stay a pleasant one. President Kennedy responded to the address in behalf of the association and afterward delivered his annual address. He alluded to the bitter struggle in Iowa and other States between the Bell and Independent interests, and called attention to the fact that as telephony is comparatively new in South Dakota the feeling here is not yet so intense as in some other States. He spoke of the development of the rural systems in South Dakota and pointed out that the people have awakened to the fact that the telephone is an important public utility and a daily necessity in their homes.

He spoke of the fight, almost to the death, throughout the land between what is termed the octopus and the Independent companies, and stated that the American people are equal to the occasion; that they have found ways to climb mountains and will find ways out of the condition which now confronts them. He expressed the opinion that telephony cannot be monopolized and that it must be administered in the interests of and for the benefit of the people.

He pointed out that the only company acknowledging its Bell affiliations which is now doing business in South Dakota is operating in a small district in the extreme eastern portion of the State.

President Kennedy among other things denounced some competitive methods, declaring that a free telephone is as objectionable as free passes on a railroad. He urged the harmonizing of conflicting interests. At the conclusion of his address he was vigorously applauded.

On motion of Secretary-Treasurer E. R. Buck the president appointed the following members as a committee on resolutions: Geo. W. Burnside, Sioux Falls; J. A. Steninger, Parker; W. Gibbons, Yankton.

At this juncture the program was on motion suspended for a few minutes for the purpose of admitting a number of new members. About half a dozen additional telephone companies were admitted to membership in the association, and a number of supply companies were admitted to honorary membership.

Following action by the convention upon the admission of new members, George W. Burnside, of Sioux Falls, made an address on the subject of "The Independent Telephone Exchange." He spoke in part as follows :

"The Independent telephone is to the people what the self-binding harvester has been to the farmer. Forty years ago the farmers cradled their grain by hand; to-day it is cut, bound and shocked by machinery. The advances in the mode of communication in the last thirty years have been phenomenal. Thirty years ago if a man wanted to communicate with Chicago he had to write a letter and wait a week or more for an answer; in a short time he will be able to ring up Chicago or almost any other Eastern city and converse with a man over the wires of Independent telephone companies with the greatest of ease.

"The reason for the great advance in the telephone business has been brought about through the interest and energies of the Independent people. The only place where the rates have not been reduced is in the larger cities, where the monopoly still obtains."

The next speaker was George T. Hewes, of Des Moines, Iowa, the subject of his address being "The Clearing House."

J. L. W. Zietlow, of Aberdeen, the guiding spirit in the Dakota Central Telephone Company, made a few remarks on the alleged ineligibility of the South Dakota Association to join the National Independent Telephone Association because it has members from companies which connect with the Bell company. He pointed out that South Dakota was one of the pioneers in the development of the Independent telephone movement. Following these remarks Mr. Zietlow made an address on "The Proper Equipment of the Local Exchange."

The next speaker was P. R. Crothers, of Brookings, whose topic was "Should Trouble Men be Equipped with a Technical Education?" He spoke in part as follows:

"To begin with, the duties of a trouble man are to locate and remove trouble from lines, cables, telephones and switchboards. After the trouble is located, its removal will depend as much on his mechanical skill as on his technical education, but to locate the trouble is sometimes the harder part. In order to properly diagnose a case the doctor must know something of the nature of the disease and of the anatomy of his patient. It is just as necessary for the telephone doctor to know something of the nature of electricity, and to have a knowledge of the general construction and "modus operandi" of the apparatus under his charge.

"He never will know it all. He ought to have enough at least so that when a complicated case of trouble arises his knowledge will enable him at once to reason out the cause of the trouble and the remedy. He ought to understand the use of testing apparatus and know how to make all necessary tests. He ought to learn to first locate his trouble before he began tearing things to pieces. He ought to learn his own limitations and know what to let alone. He ought to know what to do in case of trouble and why he does it. If he should learn something more than all this, he need not be alarmed, it will not hurt him any."

An adjournment was taken until 7:30 o'clock in the evening after J. A. Steninger, of Parker, had delivered an address on "Are Two Exchanges in the Same Town a Double Burden on the People."

The convention reassembled at 7:30 o'clock and the first thing on the programme was a paper by E. A. Bruce, of Yankton, on "Independent Toll Lines." He said, among other things:

"Competition to a community in toll line service is as necessary as competition in any other line of business, and, in fact, telephone competition is of greater benefit to the public. Experience teaches us that it brings to any community a better and larger service, wth cheaper rates to the local exchange subscribers.

"The Independent toll lines of South Dakota do not as yet cover the whole field, but public sentiment favors their construction and the growth and development of the State demands to-day a larger, better and competitive service."

H. P. Hartwell, of Irene, then addressed the convention on the subject of "Telephone Associations," speaking in part as follows:

"We need an association for the mingling and exchanging of thought, to work in harmony with our neighbors, and, not like these monopolists, the Lord of all, to rule or ruin. For equal taxation, uniform rate, better equipment and service; these were the principles upon which this association was formed. Does any one doubt the necessity for continuing an association of this character?"

Mr. A. S. Hall, of Redfield, was then introduced, and made an extremely interesting address on the subject of "Is It to the Interests of Telephone Men That All Toll Lines Connect with Local Exchanges on Equal Terms?"

In the absence of the others who were scheduled to make addresses, the remainder of the evening session was devoted to discussion of topics of special interest to the Independent tele-

Digitized by Google

phone men. Until an adjournment was taken, the convention hall was crowded and the keenest interest was manifested in the topics discussed.

Among those who participated in the discussion were J. L. W. Zietlow, of Aberdeen; Geo. W. Burnside, Sioux Falls; E. R. Buck, Hudson; Geo. T. Hewes, Des Moines, Iowa; C. B. Kennedy, Canton; A. S. Hall, Redfield, and J. A. Steninger, Parker.

On motion President Kennedy appointed the following as members of a committee to consult in reference to securing toll line connections in South Dakota, the committee to make a report at the business session to be held Thursday afternoon: A. S. Hall, Redfield; J. A. Steninger, Parker; H. P. Hartwell, Irene; E. R. Buck, Hudson, and P. R. Crothers, Brookings.

The convention then took a recess until 1:30 o'clock Thursday afternoon, January 10.

For the second day's session the convention reassembled at 2:40 o'clock Thursday afternoon. On motion the name of the organization was changed from the South Dakota Telephone Association to the South Dakota Independent Telephone Association. Six more telephone companies were admitted to membership in the association.

The following committee was appointed by the president to investigate the advisability of the State Association applying for membership in the national association, with the understanding that the committee should make a report at the evening session: Geo. W. Burnside, Sioux Falls; H. P. Hartwell, Irene; T. C. Cockerell, Sioux City, Iowa.

The minutes of the last annual convention were read and on motion were approved.

The committee appointed at a prior session to make a report on the policy of toll line connections with town exchanges reported that all toll lines should connect with town exchanges on equal terms.

The following were appointed members of a committee to formulate a specific plan for such connections, with instructions to report at the next annual convention of the association: E. A. Bruce, Yankton; J. L. W. Zietlow, Aberdeen; C. B. Kennedy, Canton.

P. R. Crothers, of Brookings, a member of the taxation committee appointed at the last annual convention, made a verbal report to the effect that, while the committee had not been able to accomplish much, it had been able to secure quite a material reduction in the assessment of farmer lines. The report of the committee was approved and the bill of Mr. Crothers for expenses in making the trip to the State capital to appear before the State Equalization Board was allowed.

The following members were appointed as a taxation committee which is to serve for the ensuing year: P. R. Crothers, Brookings; H. P. Hartwell, Irene; P. A. Zollman, Alexandria.

President Kennedy appointed the following as members of the legislative committee for the coming year: G. W. Burnside, Sioux Falls; P. R. Crothers, Brookings; W. E. Egge, Centerville. The committee will look after general legislation in which the association is interested.

On motion the city of Mitchell was selected as the place for holding the next annual convention. The constitution fixes the time for holding the convention as the second Wednesday in January, 1908.

The present officers were re-elected for the ensuing year, as follows: President, C. B. Kennedy, Canton; vice president, J. A. Steninger, Parker; secretary-treasurer, E. R. Buck, Hudson.

The following members of the executive committee also were re-elected for the coming year: Geo. W. Burnside, Sioux Falls; H. P. Hartwell, Irene; H. B. Ryan, Beresford; P. R. Crothers, Brookings.

The new arbitration committee for the ensuing year was announced as follows: A. S. Hall, Redfield; H. P. Hartwell, Irene; Geo. W. Burnside, Sioux Falls. The convention then adjourned until evening.

It was nearly eight o'clock when the convention reassembled for the evening session. The committee on resolutions reported as follows:

"*Resolved*, By the South Dakota Telephone Association, that we tender our thanks to the president, secretary and other officers for their untiring efforts in making this a very successful year, and this meeting the high water mark in the life of this association.

"Also to the daily papers of Sioux Falls for their full reports of our meetings and courtesies extended; to the supply men for their splendid exhibits and loyal support; to Mr. George T. Hewes, of Des Moines, for his able and instructive paper before the association, and, last but not least, to the citizens of Sioux Falls, notably to the management of the Cataract Hotel and the Citizens' Telephone Company, for their untiring efforts in making our stay among them both profitable and agreeable." A. S. Hall, N. E. Gibbons, J. A. Steninger, committee.

The salary of the secretary of the association, on motion, was fixed at $100 per year, to date from January 1, 1906.

The committee appointed to investigate the advisability of the association applying for membership in the national association recommended that the matter be referred to the executive committee, with authority to take such action as was deemed best.

There being no further business, the convention adjourned.

Following the convention the visiting telephone men, together with a number of local telephone men and other citizens, were guests at a banquet given at the Cataract Hotel.

Concrete Manholes

By O. R. Barnes.

INTERESTING in connection with the extensions of the use of concrete in building is the use of this material for the construction of manholes by telephone companies. The concrete manhole is being adopted rather extensively for cross-country work both in the Eastern and Western States. The new long-distance subway between Chicago and Milwaukee contains them, as do also the subways now under construction between New York and Philadelphia and between Philadelphia and Baltimore. Most of these manholes are built of Portland cement concrete composed of one part cement, three parts clean sharp sand, and five parts three-quarter inch broken stone.

These materials are mixed on a platform close to the work. The excavations for these manholes are approximately eight inches larger than the outside dimensions of the mould and in depth conform to the grade of the subway. Where good solid earth is met with only an interior mould is used, but where there is danger of the sides of the excavation caving in it is necessary to construct an exterior mould. Ordinarily, however, the exterior mould is not required. The moulds are not set up until after the mat or foundation, which consists of a coarser grade of concrete, has been thoroughly rammed into place. It is then constructed as shown in the illustration with stout planks which are held securely by driving the two ends into place. In some cases, in the East, galvanized iron moulds are used for the sides. These moulds are given a coat of grease before the concrete is dumped into place. The concrete for these manholes is mixed in the regulation manner and while fairly wet is dumped into place in twelve-inch layers. Each layer is thoroughly rammed before another layer is allowed to be dumped. A concrete manhole top is constructed, and is held in place while setting by specially constructed supports, and the manhole frame is not set in place until twenty-four hours after the top has been completed.

At approximately every 6,600 feet in the subways for long

Convention of Northwestern Cedarmen

AT the Spalding Hotel, Duluth, Minn., the Northwestern Cedarmen's Association met for its annual convention on January 8th. This convention is important to all purchasers of telephone poles, as it marks the annual gathering of the men who supply by far the bulk of this class of material to the telephone trade. The leading producers of white cedar poles in Michigan, Wisconsin and Minnesota were present at this meeting and made it one of the most successful gatherings which the members of the organization have ever held.

When the first session was called to order it was found that President M. H. Coolidge had been unable to leave his home on account of illness in his family. In his absence the chair was taken by Vice-President P. W. Raber, of Chicago. Practically the first business before the meeting was the reading of his report by Secretary M. O. Nelson. He referred to a summary of the cedar products during 1906 as compared with the output during 1905, which had been placed in the hands of members. This summary showed that during 1906 there was a slight increase in the production of poles over that for the previous year. This increase, however, might possibly be attributed to the fact that a year ago there were practically no poles in the market, so that the entire demand of the year had to be supplied by new cuttings. The secretary stated that his report was not as complete as he should have liked to see it owing to the fact that the small number of days intervening between the first of January and the annual meeting makes it difficult to get a full report of stocks on hand. Referring to the estimates of cedar to be produced during the coming winter the secretary predicted that, judging by the conditions made evident by the reports sent in to him, the total output of poles will be about the same as last year.

M. H. Coolidge.

T. P. Bradley.

The association devoted a great deal of time to the consideration of matters affecting weight schedules for different classes of poles. This subject, of course, is of importance on account of its special bearing upon the cost of transportation. Reference was made in the proceedings to the fact that market reports have been issued from time to time from the headquarters of the association and that an Eastern freight rate has been published. Reports have been kept at the secretary's office, to be forwarded to members when desired, showing the condition of railway scales over which cedar is weighed.

The association has increased its membership from thirty-two to thirty-eight during the past year and the treasurer was able to show a sufficient balance to indicate that the financial affairs of the association are in good condition.

Considerable time was devoted to a discussion of subjects relating to the shipping of poles and other cedar goods, in addition to a consideration of the method of weighing.

H. S. Gilkey, of Pendleton & Gilkey, Minneapolis, Minn., speaking of general conditions in the cedar trade, referred to several factors which may be expected to increase the cost of logging. Referring to the effect of the relations of supply and demand and the cost of production as determining factors in the value of cedar products, he stated that every member would be able to judge for himself what his product ought to bring during the coming year, thus venturing upon no absolute prediction of prices. Although hauling was commenced about the middle of December, very little has been done so far during this season. Some people are still cutting and skidding, and it is possible that a very considerable part of the stock that has been cut will not be gotten out at all this winter.

This is the most interesting statement concerning the pole trade, as the Pole Committee, of which E. L. Clark is treasurer, had no report to present to the members.

After a discussion of various other matters, the chairman appointed the following Committee on Nominations: H. S. Gilkey, L. R. Martin, M. K. Bissell, W. P. Bowring and E. Huser. After a short recess the committee recommended the election of the following officers: President, P. W. Raber; vice-president, A. T. Naugle; treasurer, W. B. Thomas; directors, one year, Hall L. Brooks; two years, L. R. Martin and E. L. Clark. These recommendations were accepted and elections accordingly made by the members. After a few very pleasant speeches by the newly elected officers, Mr. Gilkey offered a motion extending a vote of thanks to the retiring president, M. H. Coolidge, which was enthusiastically carried. The final action of the convention was the adoption of an amendment to a specification proposed by H. M. Clark, in response to a suggestion made earlier in the day, which reads as follows: "On the specifications for standard telegraph, telephone and electric poles in the sentence commencing 'If poles are green,' the measurement of the tops of five-inch poles is to be sixteen inches in circumference instead of five inches plump in diameter, as at present.

In the evening, after the adjournment of the convention, the members met at a most enjoyable banquet, at which the hosts were the Duluth Log Company, Martin Brothers, L. R. Martin, the Cloquet Tie and Post Company, the Pittsburg and Lake Superior Iron Company and the Marshall H. Coolidge Company.

Wm. P. Bowring.

Among those present at the convention were the following well-known dealers:

P. W. Raber, Raber & Watson, Chicago.

J. W. Benham, Naugle Pole and Tie Company, Chicago.

F. H. Chandler, Marshall H. Coolidge Company, Minneapolis.

H. M. Clark, Clark Pole and Tie Company, Bemidji, Minn.

A. T. Naugle, Naugle Pole and Tie Company, Chicago.

J. W. Naugle, Naugle Pole and Tie Company, Menominee, Mich.

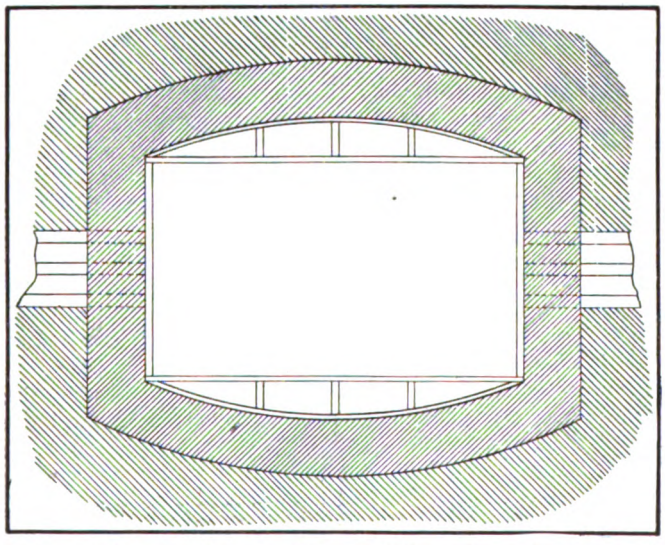
CONCRETE MANHOLES.

(*Continued from page 35.*)

distance trunk cables a manhole of extra large size is built. These large manholes are designed especially to receive the Pupin loading coil pots. These manholes are finished inside with a layer of mortar of one part of cement to three parts of good



Outline of Concrete Manhole, Showing Method of Constructing Mould of Planks.

clean sharp sand. The layer is about three-eighths of an inch thick. As a rule the manholes are oval in shape, so as to reinforce the sides and ends by lateral compression. So far it has not been found necessary to introduce steel reinforcement in the construction, but it seems that a few rods, which are cheap, might be found of advantage in holding the corners in place, to keep them from being torn off during wash-outs due to the settling of the earth around them, as has happened in numerous instances.

While concrete manholes seem to be very appropriate for cross-country work, it is not safe to say that they will do for city work, since they are monolithic in construction, and when once built are hard to drill through should it become necessary at any time to add a duct, as is happening every day in a growing plant. For this reason it is hardly likely that they will displace the familiar oval or octagonal brick manholes now commonly used in cities.

VERMONT AND NEW HAMPSHIRE INDEPENDENTS HOLD ANNUAL CONVENTION.

MEMBERS of the Vermont and New Hampshire Independent Telephone Association held their fourth convention on January 8th at Bradford, Vt.

When President H. W. Buchanan called the convention to order there were about 75 people present, representatives of the 33 companies in the association, with their wives, representatives of various supply houses and others. G. W. Buzzell, of St. Johnsbury, the secretary, read a report which covered a great deal of matter of general interest to Independent companies, dealing with growth, construction and litigation. He urged the use of the Shield, urging all members and all interested in Independent lines to stand together against the encroachment of monopoly and for the rights and interests of the people.

"We have shown the people and legislature of this State," he said, "that we are a power and that we are united to protect ourselves and the people from the unjust iron rule of the Bell Telephone Company. Our association has been the means of making some laws for our protection and there will be more made as we need them, and every Independent company in Vermont and New Hampshire should belong to this association for its own protection and the protection of its patrons."

The following resolution offered by him was adopted:

Resolved, that we, the Independent non-Bell telephone companies, constituting the Vermont and New Hampshire Independent Telephone Association, do rejoice at the success of the Metropolitan Independent Telephone Company of Boston in securing a franchise of that city against the wishes of the great monopoly, the Bell Telephone Company, and their sympathizers, and we further extend our sympathy to the men behind the guns in this great fight for their rights. When Boston and the other large cities in which franchises have been granted to Independent telephone companies are installed we will be glad again. That is what we are waiting for in Vermont and New Hampshire, 30,000 'phones strong, and further we offer our services in any way that may be beneficial to the Independent movement in Boston or elsewhere.

The officers elected were:

President, H. W. Buchanan, Barton Landing, Vt.; vice president, O. D. Eastman, Woodsville, N. H.; secretary and treasurer, G. W. Buzzell, St. Johnsbury; executive committee, H. W. Buchanan, G. W. Buzzell, O. D. Eastman, Woodsville, N. H.; Fred C. Gleason, Warren, N. H.; D. L. McGuire, Albany, Vt.

A resolution was adopted thanking the officers for their work in securing legislation.

Several interesting speeches were made at the afternoon meeting, among those who addressed the representatives being F. E. Ebersole, manager of the Northeastern Company at Portland, Me., who told of the growth of the Independent movement in that State and of its beginning in the West; W. E. Kinsman, manager of the Heath Company of Shelburne Falls, Mass., which is extending into Vermont; W. H. Johnson, of Laconia, N. H., manager of the People's Company; W. A. Perkins, manager of the Strafford Co-operative Company; C. A. Washburn and C. C. Speare, of the Orange County Company; J. W. English, of the Hartland Company and representatives of some electrical houses. The speakers all told of the success and steady growth of the Independent movement in their respective territories.

A banquet was served in the evening. Fred C. Gleason, of Warren, N. H., one of the executive committee, was toastmaster, and the speakers were: H. L. Moore, Barton Landing; J. B. Peckett, Bradford; Captain Lucas, Lake Morey; A. L. Speare, West Corinth; W. E. Kinsmore, Heath, Mass.; L. G. Lyman, White River Junction; C. M. Libby, South Rygate; F. C. Whitman, Boston; C. D. French, Canaan; G. B. Shaw, Exeter, N. H.; C. A. G. Jackson, Boston *Herald;* S. Gordon, Ashland, N. H.; F. C. Redfield, Nashua, N. H.; J. C. Blood, Norwich; W. E. Smith, Colbrook; W. J. Griffith, New York; E. D. Gilson, East Burke; G. W. Buzzell, St. Johnsbury; Fred Bowker and the Rev. Henry Kilburn, Bradford; W. A. Peterson, Boston; W. A. Barber, Heath, Mass.; A. D. Richmond, Boston; D. L. McGuire, Albany; W. B. Johnson, Laconia, N. H.; E. B. Seelye, Boston.

The members present at the meeting represented a business which is steadily being extended. They cover a territory reaching

QUERIES

MEASURING BRIDGING LINE.—(816.)

I have an Illinois Direct Reading Ohmmeter that I am unable to operate on bridging farm lines. It reads from 0 to 10,000 and it is all right on a straight bridging circuit, such as a toll line, but on a divided bridging line with spurs running off of the main line I am unable to understand how to figure it out. Now, for instance, I connect it to the line at switchboard terminal; there are twenty miles of No. 14 iron wire with twenty-eight telephones bridged to it, 2,000 ohm ringers, and I get a reading of 240 ohms. This I don't understand. What should I figure in reference to the telephones? A little information will greatly oblige,

W. P. J., Nebraska.

In endeavoring to test for the resistance of the above line you have evidently overlooked the shunt effect of your twenty-eight 2,000-ohm ringer coils across it. So, before taking up the case in point, we will figure a few simple shunts. In the upper part of Fig. 816-*a* we had four wires, *A*, *A*, *X*, *X*. From *A* to *B* they measure 100 ohms each. From *X* to *Z* they measure 200 ohms each. Connect the two *A B* lines, as shown at *C D*, and we have a resistance of but 50 ohms. Connect the two *X Z* lines, as shown at *E F*, and we have a resistance of but 100 ohms. Then, if we connect the two pairs of wires as shown at *G H*, we will have a resistance of 33 1-3 ohms. These results are obtained by dividing the product of the two resistances by their sum, as is shown by the following:

$$100\omega + 100\omega = 200\omega$$
$$100\omega \times 100\omega = 10{,}000\omega$$
$$10{,}000\omega \div 200\omega = 50\omega$$

Fig. 816-*a*.

In diagram 816-*b* we have illustrated a party line similar to the one you mention, inasmuch as it has twenty-eight stations, is twenty miles long and is built of No. 14 iron wire. We are considering this wire is measuring 57 ohms per mile. As you did not state the length of the legs, we have supposed them to be of various resistances, as you will note. The figures at the ends of the legs indicate the resistance from the main line, including the 2,000-ohm ringer.

The distance between the legs on the main line we have also assumed arbitrarily, as you did not specify them in your question. None of the other figures are exactly correct, but are accurate within 1 per cent. We make this allowance so as to be able to drop the fractions.

No. of leg.	Res. in ohms.	No. of leg.	Res. in ohms.	No. of leg.	Res. in ohms.
1	2279	10	362	20	269
2	1234	11	346	21	263
3	894	12	333	22	258
4	707	13	322	23	254
5	527	14	311	24	250
6	474	15	301	25	247

9	377	18	281	28	240
		19	275		

Table 816-*c*.

If the line is open between No. 1 and No. 2 you can readily see that the resistance would be 2,279 ohms. If open between No. 2 and No. 3 the resistance would be 1,234 ohms. These results are obtained by application of the formula for shunts previously explained. The leg No. 1 having a resistance of 2,114 ohms shunted by the line and leg No. 2 having a resistance of 2,164 ohms would give you a resistance of 1,069 ohms if you were measuring across the juncture of leg No. 1 and main line. This resistance added to the line resistance between exchange and leg No. 1 gives you the above resistance of 1,234 ohms. You arrive at the resistance of an open between each set of legs by using the above system and stepping up for each leg. The entire line being figured out completely in Table No. 816-*c*. You will note by this table that with all of the telephones on the line the resistance that would show on your ohmmeter would be 240 ohms, which is the reading you now obtain.

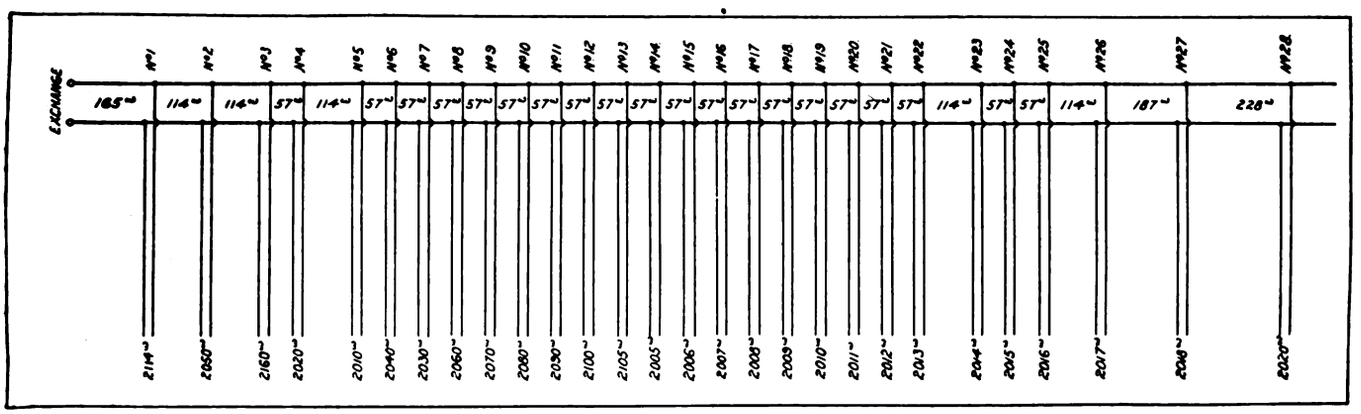

Fig. 816-*b*.

For locating a short circuit the same method of calculation would obtain. As an example we will suppose the line to be short circuited half way between the legs No. 3 and No. 4. The resistance of this short circuit from leg No. 3 would be 28½ ohms. The resistance from leg No. 1 to leg No. 3 is 729 ohms. Therefore a reading at junction of No. 1 and the main line would be 27½ ohms, which added to the line resistance of 165 ohms, will give the resistance of 192 ohms.

If you are unable to calculate your lines from the above explanation kindly write to us again, enclosing a diagram giving all linear measurements and we shall be pleased to give you correct figures.

THE EXCUSE OF THE KNOCKER.

SAID a telephone subscriber one day, "These men your company sends around to fix my telephone are the worst knockers I ever saw. The thing hasn't been working for a week, and three different men have been coming in here. The first one looked wise, and said the man who put it in didn't know his business. The second said there was nothing the matter until Jones came and made the connections wrong; and the last one said the man before him was a fool. But it isn't working yet. Now, why don't you fire some of those fellows and get some men that know what a telephone needs when it's out of order?" That subscriber was about ready to throw up his contract and go over to the competing company for service. What he said is a good pointer for any telephone man. The worst of it is that there are so many who need it, and need to have it driven home so hard that it will stick.

Telephone subscribers are notorious complainers. They find fault with the loss of a few seconds. The value of time seems to be multiplied by a tremendous coefficient when a man is waiting to have a connection completed. Once a man is educated to receive an answer in ten seconds he becomes as accurate as a stop watch. He is sure that what he is paying for is ten second service every time he takes the receiver off the hook.

If he doesn't get it he can't be happy. If anything goes wrong the company is to blame, either for a deliberate attempt to cheat him, or at the least for a consistently poor management. This impression creates itself so easily, and is so hard to eradicate that any statement from a representative of the company which tends to confirm it, no matter how absurd, is immediately seized upon as a most damning truth.

Personal interest in the efficiency with which the company's plant is kept up is a good thing for every employee to feel. It is a good thing for each man to know not only what is the matter with an instrument when he inspects it, but just how the fault results from poor workmanship. It is right for him to make his report out with sufficient accuracy to show both of these things. Then if the man who came before him has been careless, or slipshod, or ignorant, it is a poor chief who cannot find it out very readily; and it is an inefficient chief who will not see that pains are taken to overcome the cause of the inefficiency in the man responsible. It is always to be borne in mind that it is the chief who should know the cause of trouble and not the subscriber.

The thing which is important is not to make the condition known, but to remedy it, and the remedy lies alone in the hands of the chief and the man who is at fault. As for the subscriber, the more he knows about the failings of the company's men, the less he likes the company. He even loses his respect for all its men, and the inspector who visits the station becomes less and less sure of a cordial reception. He is known as a member of an undesirable class, a group of inefficient workmen. So it is that relations between a telephone company and its subscribers may become more or less strained through the indiscretion of its trouble men. They forget their fault-clearing function in its proper sense to become mere breeders of trouble that they can never remove.

When this is once realized by a trouble man he is seldom likely to repeat the indiscretion. He soon realizes that he can better turn his words to account in advertising the good points of the service. A few statements to the effect that the company freely devotes its best energies to the improvement of its plant and the maintenance of its service on a high plane of efficiency can be made by him just as easily, and with just as much truth; and he then becomes a representative that it is worth while to send out. Such a man will become known in a way that brings his name to mind when some one is to be selected for a better place. He will have the approval of his associates, his superiors and the subscribers he has met. He will have acquired the spirit of co-operation which makes him in every way a contributor to the success of the interests he serves, and this is the spirit which makes his own work easy to perform and gives it a high value.

ACCOUNTING AND THE SUBORDINATE EMPLOYEE.

COMPARING jobs, the average lineman usually does not find it very difficult to persuade himself that his position in the company is rather more satisfactory than the one occupied by the bookkeeper. Of course, it keeps him out of doors and gives him exercise that holds him in a condition of physical fitness that is probably surpassed by no class of men, with the possible exception of professional baseball players. When he goes home at night he is ready to eat a meal that would do for four bookkeepers, and enjoy every bit of it. This is an advantage which should not be despised, but is one which can usually be offset by the bookkeeper who thinks it worth while. The main reason for any feeling of personal satisfaction derived from the comparison may usually be traced to the lineman's belief that he is in a real sense a producer. He takes the raw material from stock and puts it where it can be made productive. Poles and tenpin arms lying in the yard are no more than so much dead wood. Let the men get together and set them up and put on the insulators and string the wires, however, and they immediately become productive instruments of civilization of the most valuable kind. The lineman can see that he has built something which is an aid to social development and helps business. This is so obvious that it must appeal to any man who thinks about his work, and takes a pride in it, and it gives him a certain amount of satisfaction. When he considers the matter in the light of its relation to his position in a working organization, and the way it may lead to his advancement, however, he should see that the mere accomplishment is not all. He must put himself in the place of those who look upon a telephone company as a business organization, and consider the costs of the various classes of work he does. Here is where he needs information—the kind of knowledge that the bookkeeper may so easily acquire.

The making out of reports seems to be the hardest work that falls to the lot of the construction man. The main reason for this is likely to be that he does not understand their significance, and does not know why they must be made out in the established forms. A request from the auditor for further information on a voucher made to enable that officer to properly distribute expenses on his books is too likely to be looked upon as an affront, or as a demand for useless work. This causes a mild form of friction, which hinders the proper working of the company. On account of these things it would seem to be desirable for managers to take pains to instruct employees in construction and maintenance departments in the mysteries of bookkeeping to a greater extent than is commonly practised. Once the men realize how the various reports they make fit into the general scheme of conducting a telephone business for profit, their interest in securing correct results is shown in their work. They then are in a position to feel that they are co-operating with the management. From watching costs in detail, as they are classified, they gradually get to know them in a way which causes them to attempt to make reductions, thus increasing their efficiency.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

CROSSING CONTRACT WITH RAILROAD COMPANY.

I enclose copy of a contract from a railroad company for your perusal, and wish you to give me an opinion as to what the railroad company could do if we refuse to sign it. Also what would or might be the outcome if we should sign the agreement. We cross the railroad track at several points now and will probably cross several times more. Can the company prevent us from crossing? G. W.

EDITOR'S NOTE:—The agreement which accompanied the above letter recited that the railroad company granted "license and permission" to the telephone company to extend its wires across the right of way, railroad tracks and telegraph lines of the railroad company under a certain bridge, upon a number of conditions, among which were provisions for the kind of poles, their height above the rails, kind of cross arms and guard wires, distance of poles from the tracks, etc. It was also provided in the contract that the poles and wires should be moved or changed as the railway company desired, at any time, but at the expense of the railroad company. The license granted by the railroad company was to be revocable at any time on thirty days' notice, and if the telephone company did not remove its poles and wires in accordance with such notice, the railway company was to have the right to remove them forthwith, without being liable for any damages to the telephone company, which was to bear all the expense of removing said poles and wires. The telephone company was to save and keep harmless the railway company from all claims for damages resulting from injuries suffered by the railway company, its agents, employees, servants or third persons, either in person or in property, resulting from anything done or omitted to be done by the telephone company in the construction, maintenance, use or operation of its property. The telephone company was to agree to remove its property from the right of way upon the termination of the license, and in a peaceful manner.

THE statutes of Arkansas, in which state the above-mentioned telephone company is located, provide (Digest of Statutes of 1904, Ch. 58, Sub. IV., Section 2934) that telephone companies may construct, operate and maintain lines along and over lands of private individuals, and upon, along and parallel to any of the railroads of the state, and on and over bridges, trestles and structures of such railroads, provided ordinary use is not obstructed, and just damages are paid to the owners of such railroads. By Section 2935, it is provided that if a telephone company fails to get consent of the railroad company, it may condemn such right of way as it needs over the railroad company's property. Section 2936 gives the telephone company the right, by its agents, to peacefully enter upon the right of way of any railroad company and survey, locate and lay out its lines subject to any damages that may result.

You will notice from the above citations from the laws of the state that your company does not need to sign the contract proposed by the railway company unless it so wishes. In case it does not sign, and the railroad company refuses to permit the crossings, the telephone company may, by condemnation proceedings, force the railway company to permit a crossing. Under such circumstances the railway company would probably have to pay the cost of the proceedings and would not be able to dictate terms. The proceedings would, of course, take some time, and during that time the telephone company would be without its crossings. If you sign the contract, the railway company could then make you move at any time on thirty days' notice, but upon receiving such notice from the company you would be able to commence condemnation proceedings and soon compel another crossing, although, of course, your service would be impeded in the meantime. If, after consideration of the above suggestions, you decide to sign the contract, you might suggest to the railway company that, before you execute it, you wish the contract modified so as to provide sixty days' notice for termination, and that it also be modified so as to make your company agree to save and keep harmless the railway company from only such "claims and demands for damages resulting from injuries which result from anything *negligently* done or anything *negligently* omitted to be done" by you. Under the contract as it now stands, it might be asserted that the telephone company was liable for its acts whether negligent or not, and by inserting the words "negligently" as italicized above any such interpretation would be guarded against.

LICENSE TAX ON PAY STATIONS IN LOUISVILLE, KY.

ANOTHER legal fight between the city of Louisville, Ky., and the Cumberland Telephone Company will be precipitated by the signing of the new license ordinance by the Mayor. There is a section in it which provides that a license tax shall be placed on all pay stations of telephone companies, the exception in favor of the Cumberland contained in the words, "except those companies now paying a franchise tax" having been very properly stricken out by the Aldermen.

As the Cumberland Telephone Company has about 300 pay stations in the city, and as a sufficiently heavy license has been fixed to minimize the profits, it is quite certain that the company will object to the payment of the license.

In the same connection druggists who are members of the Retail Druggists' Association have asked their organization to use its influence to secure the passage by the Council of an ordinance giving the Home Telephone Company the right to establish pay stations, which, according to the terms of their franchise, they expressly waived. There is doubt as to the power of the city to add that right without repealing and re-enacting the original ordinance.

NUMERALS CANNOT BE MONOPOLIZED.

AN independent telephone company may use the same numerals to designate the telephone number of its trouble clerk as are used by a Bell telephone company for the same purpose. This is a recent decision of the Supreme Court of Utah in one of the most inconsistent and uncalled for suits ever brought by the monopoly to perpetuate its control of a feature of the telephone business. The Rocky Mountain Bell Telephone Company at Salt Lake City, Utah, originally asked that an injunction be issued by the District Court restraining the Utah Independent Telephone Company from using the number "888" to indicate its trouble clerk, alleging that a diversion of business would result from the use of the same number which had been selected by the Bell company for its trouble department.

The Bell Company claimed that by reason of the same number being used, and by reason of the fact that the telephones of both companies were somewhat similar in appearance, the Independent company would receive information concerning trouble with the instruments of the Bell subscribers and would thus be enabled to send their solicitors to such subscribers and get them to subscribe for the Independent telephone service.

The Supreme Court opinion holds that deceit and fraud were not practiced by the Independent company in selecting a number for the trouble department identical with that used by the Bell Company for the same department, and that the Bell Company has no cause of action.

IN THE OPERATING FIELD

VERMONT AND NEW HAMPSHIRE CONVENTION.

(*Continued from page 38.*)

from Penacook, N. H., into Canada, and back to Berlin, N. H., and from White River Junction to Wells River, taking in a large part of the eastern section of the State of Vermont.

Attempts which were made by the association to secure favorable legislation at the recent session of the Vermont General Assembly resulted in the passage of an act providing that:

"Every railroad corporation doing business in this State shall grant to every person, firm, joint stock company or corporation operating a public telephone line in this State equal and reasonable terms, arrangements and facilities for the installation of telephone instruments on the lines or connected with the telephone system of such person, firm, joint stock company or corporation, in all depots, station houses or offices of such railroad corporation in the State of Vermont."

This was aimed at the Boston & Maine Railroad, which has an exclusive contract for the placing of telephone instruments and booths in the stations of that company. The Independent companies, which have about 8,000 subscribers along the line of the Boston & Maine, had been refused permission last October to place instruments in these stations, the reason alleged being the existence of the contract and the belief of the management that better public service would be given by a contract with one company alone. Since the passage of that act negotiations have been renewed and the company has expressed its willingness to allow the installation of instruments, and only the details remain to be arranged.

Plans for future advances were discussed, and all present expressed their enthusiasm at the outlook for the coming year.

MISSOURI LEGISLATURE TO CONSIDER ACT REQUIRING INTERCONNECTION BETWEEN TELEPHONE COMPANIES.

IN the General Assembly of the State of Missouri there has been introduced an act requiring that where two or more telephone companies maintain exchanges in the same city, town or village, it shall be the duty of such companies to provide means whereby subscribers for the service of one company may have communication with persons on the lines of the other company or companies. The bill provides that the fee for such connection shall not exceed three cents for each call, and that connections between exchanges of companies operating separate systems in the same city, village or town, shall be established not later than December 1, 1907.

PENNSYLVANIA TO HAVE A NEW CHAIN OF MODERN INDEPENDENT TELEPHONE EXCHANGES.

IN Beaver County, Pa., there is a locality known as Beaver Valley, in which are located some fifteen or twenty cities and towns which form practically the only important district in Pennsylvania which is not now supplied with Independent telephone service. Among these towns may be mentioned Beaver, the county seat; Rochester, New Brighton, Beaver Falls, Monaca and Ambridge, with a number of smaller towns, all within a half hour's ride of Pittsburgh. As Pittsburgh has excellent Independent service, the absence of connection with that city over such lines has been a source of inconvenience to many of the residents of these towns.

Although various attempts have been made to procure Independent franchises, they were unsuccessful until the arrival of Mr. S. C. Thayer, who had made a successful record in developing and managing an Independent company in Newton Falls, O., and as organizer and later president and general manager of the Columbiana County Telephone Company, at Salem, O. After twenty months of activity, with the assistance of many people anxious to secure the benefits of Independent telephone service, he has secured franchises in all important Beaver Valley towns excepting Rochester, and this place is soon expected to fall in line. A feature which at present is greatly in favor of an Independent company is the fact that the Bell company is now giving magneto service with rates as follows: Business desk sets, $76; business wall sets, $60; residence, $51. Independent rates will be much lower.

At Beaver Falls, the largest town in the valley, the underground work is now completed, and it is being rapidly pushed in other towns. Modern buildings will be erected, and first-class equipment installed. The construction of this extensive system is under the direction of Frank B. Hall. Under such management the new company believes it is assured of success from the start in the valuable field which it will develop.

GOVERNOR J. A. JOHNSON RECOMMENDS AMENDMENT OF MINNESOTA TAX LAWS FOR TELEPHONE COMPANIES.

IN his message to the Legislature of Minnesota Governor John A. Johnson called attention to the fact that under the present statute telephone companies are taxed on their gross earnings derived from business within the State, which shall be in lieu of all other taxes and assessments upon such company and its capital, and that these taxes shall be paid into the State treasury on or before January 1st in each year. He states that the one defect in this law arises from the fact that there is no penalty imposed for failure to pay these taxes, the State being required to bring suit to recover if payment is not made on demand. He recommends to the Legislature that the statute shall be amended to provide a penalty for the failure to pay taxes, in order to relieve the State of unnecessary litigation, which is now necessary, in order that it may not be deprived of the use of the money.

BOOK REVIEW.

HYDE'S TELEPHONE TROUBLES AND HOW TO FIND THEM, by W. H. Hyde; 56 pages and numerous illustrations. Published by W. H. Hyde & Company, Milwaukee, Wis. Price 25 cents.

This is the twelfth edition of this well known book, which is intended to give a list of the most common troubles affecting magneto and central energy systems. Much new material has been added, with the object of bringing it up to date, and strengthening the information contained in previous editions. The field covered embraces not only switchboard troubles, but the clearing of troubles on four party selective lines and various parts of the sub-station set. Directions for the installation of rural lines, ground wires, lightning arresters, etc., are also given. The book is illustrated with a number of appropriate diagrams, and contains tables of information useful to practical telephone men.

CUMBERLAND COMPANY TO BE REQUIRED TO PAY $50,000 FOR CONTRACT WITH MEMPHIS, TENN.

THE lower board of the legislative council at Memphis, Tenn., is threatening the Cumberland Telephone and Telegraph Company with the passage of a resolution providing that in addition to the recommendation of the upper board, the company be required to pay into the city treasury the sum of at least $50,000 before a contract is entered into between it and the city.

For some time there has been a controversy between the city and the Cumberland company, the contention on the part of the city being that the telephone company is operating here without a contract of any character. Several meetings

Digitized by Google

have been held at which the matter has been gone over. Finally the committee of the upper board filed a report directing that the contract be signed, provided the company would make the same rates as are charged by the Memphis company for business telephones, and provided further that citizens be given a better service.

ENJOYABLE FEATURES OF STOCKHOLDERS' MEETING AT NEW PHILADELPHIA, O.

STOCKHOLDERS of the Tuscarawas County Telephone Company, of New Philadelphia, O., held their annual meeting on January 8th. An especially enjoyable feature of this gathering was the banquet which followed the business meeting. Mr. Dwight E. Sapp, of Mt. Vernon, was introduced by General Manager J. K. Johnston as toastmaster, and in his introductions of the speakers he gave a tone of cheerfulness which was characteristic of the entire meeting. Interesting and enjoyable talks were given by F. L. Beam, president of the State organization; W. F. Laubaugh, president of the Independent company of Akron; Mr. McIntyre, of Chicago; Rev. H. N. Campbell, Judge Yeagley and J. S. Brailey, Jr., of Toledo.

Various features of the organization and conduct of a successful telephone company were discussed by the speakers at the banquet, and at the conclusion General Manager Johnston and the other officers of the company received the hearty commendation of the stockholders and guests for their success in building up one of the finest telephone plants in the State. All agreed that the meeting had been most enjoyable.

At the business meeting, which had been held earlier in the day, much enthusiasm at the success of the company was expressed. The following officers were elected:

President, Chas. H. Slingluff, Dover; vice-president, J. K. Johnston; treasurer, J. L. Kennedy; secretary, E. A. Walter, all of New Philadelphia. Directors are: C. H. Slingluff, J. K. Johnston, J. L. Kennedy, E. A. Walter, E. D. Moody, Jas. S. Brailey, Jr., G. A. Beers, E. R. Van Ostran, C. D. Juvenal, J. M. Blatt, Dr. Goodrich and Andrew Deis. W. B. Gregson was re-elected auditor and ass't general manager, while J. K. Johnston was re-elected general manager.

CUMBERLAND'S APPEAL FOR LEGISLATIVE AID A JOKE.

THE Cumberland Telephone Company (Bell) has presented a memorial to the Tennessee Legislature seeking to enlist the sympathy of that body for the company in its fight with the Independent lines. The memorial has about fifteen hundred words and is signed by J. E. Caldwell, president. After a long preface, in which President Caldwell tells of what the Cumberland has done for the public and of the "speculators," as he terms them, organizing opposition companies to invade a territory developed by his company, he takes up the company's private affairs and explains its growth in the past fifteen years, showing that its capital stock has been increased from a little over one million ten years ago to something over twenty millions at present. He then tells of the advance in price of all materials used by the company in construction and maintenance.

In a pathetic appeal Mr. Caldwell tells how "Speculators," referring to the Independent companies, now attempt to induce the Legislature at every session to pass laws adverse to the interests of his company. In lieu of such legislation, Mr. Caldwell contends, the Legislature of Tennessee should pass a law creating a public tribunal before which all matters concerning rates, service, competition, etc., of the telephone companies or against them should be taken. This tribunal, he says, should have authority to investigate every character of complaint and decide on its merits, placing the courts where, when final trial comes, they can get the information necessary to enable them to decide on the equity of contentions. The unusual nature of the memorial created some talk when read, but the Cumberland has had so many tribulations before the courts and public in Tennessee that the Legislature did not take the matter seriously. Thus far no member of the Tennessee Legislature has offered a bill providing for the tribunal asked for.

"TO THE EDITOR"—

It is a regrettable fact that sometimes some subscribers to AMERICAN TELEPHONE JOURNAL discontinue their subscriptions. In every instance, with scarcely a variation, the subscriber's having chosen another walk in life is the reason given. Naturally the Editor cannot expect AMERICAN TELEPHONE JOURNAL to interest and be of value to any but telephone men.

The letter quoted below is an instance and is written in a very happy vein:

THE LINCOLN AVENUE POULTRY YARDS
CARL C. CURTIS, OWNER
SUCCESSORS TO
CAPT. R. PRYCE MITCHELL
SANTA BARBARA, CAL.

STANDARD BRED S. C.
WHITE LEGHORNS, EXCLUSIVELY

PASADENA, Cal., January 5, 1907.

AMERICAN TELEPHONE JOURNAL,
New York.

Gentlemen:

Judging from the status quo as regards myself as indicated by the above letter-head, do you honestly believe that your excellent journal can be of the slightest assistance to me in promoting the welfare of the domestic hen? Since embarking upon this enterprise as a relief from the trials and tribulations, the gray hairs and wrinkles, the sour and morose disposition, and the generally friendless and cheerless life of the follower of telephony, I have patiently searched your columns for enlightenment as to why a hen persistently does the identical thing you do not want her to do, without relief. Also you are silent upon the question of the hour, namely: how to make hens lay when eggs are sixty cents per dozen. Gentlemen, you see my position.

The time was when *your paper was of the greatest use to me and its coming was eagerly watched for*, but I am trying to get next to Nature now, and you are too far away. Should the "Divinity that shapes our ends" again order me back to the fire for another singeing, I will call on you for help, but till then please discontinue your reminder of other days.

Yours very truly,
CARL C. CURTIS.

Mr. Curtis apparently has "stepped out of the frying pan into the fire" from the troubles he is having with his hens. And he has the Editor's sympathy. But the Editor sincerely appreciates the very pleasant things Mr. Curtis has to say for AMERICAN TELEPHONE JOURNAL.

BUSINESS MEN OF NORWICH, N.Y., CUT OUT BELL TELEPHONES.

EIGHTY-FIVE of the business establishments in the village of Norwich, N. Y., have entered into an agreement to discontinue the use of Bell telephones. It is expected that by the end of this week practically every business house in the village will be using only Independent telephones, as the number who have not signed the agreement is very small. With the discontinuance of the service by business men, it is natural that the value of residence service will be much reduced, so the Bell company will have little business in the town. At the meeting at which this action was taken, after a careful consideration of the subject, it was agreed that the Marquis Telephone Line (Independent) controlled by J. B. Marquis, Jr., not only gives them equally good service at a less cost but that they can reach a larger proportion of their customers over the Marquis lines than over those of the Bell company. The Independent company is already making arrangements to increase its equipment to handle the additional business which it expects.

TELEPHONE PATENTS

COMBINED RECEIVER AND INDUCTION COIL.

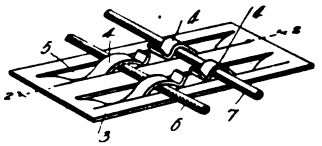
David H. Wilson, Chicago, Ill., patents (No. 836,848; dated November 27, 1906; filed December 8, 1902; serial No. 134,261) and assigns to George W. Kretzinger, Chicago, Ill., a combined receiver and induction coil.

The receiver pole pieces are secured to the poles of a specially designed induction coil. The ear piece is attached to the main portion of the receiving instrument by a rubber tube. An auxiliary device consists of a circuit breaker which may be actuated by the induction coil magnet on the closure of a special ringing key, so that a subscriber may ring from local battery, the interrupted current being stepped up to the required voltage in the induction coil.

TEST CONNECTOR.

Aubrey Wardman, Whittier, California, patents (No. 839,346; dated December 25, 1906; filed December 18, 1905; serial No. 292,350) a test connector.

From a plate of resilient conductive material are stamped



spring tongues 4, which are left secured to the plate at its opposite ends, but have the free ends which project toward each other bent in the manner indicated in the drawing to form a wire receiving section.

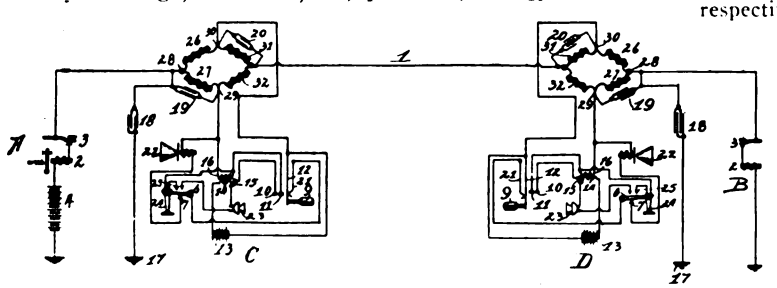
PLAN FOR OVERCOMING INDUCTION.

Isidor Kitsee, Philadelphia, Pa., patents (No. 838,788; dated December 18, 1906; filed August 11, 1906; serial No. 330,201) an improvement in the electric transmission of intelligence.

The object of this invention is to provide means to counteract the inducing effect of high potential lines upon telephone wires. To accomplish this the inventor encloses each power wire with a coil connected to a second coil embracing a group of telephone wires. These coils are intended to be so proportioned and connected as to receive from the power line and impart to the telephone line, by induction, electrical impulses equal and opposite to those induced by the action of the power lines through the air.

COMPOSITE SYSTEM.

Harry O. Rugh, Sandwich, Ill., patents (No. 839,210; dated



December 25, 1906; filed October 20, 1906; serial No. 339,832) a composite system.

Transmission line 1 extends between telegraph stations *A B* and telephone stations *C D*. The circuit for talking currents and for the telephonic signalling currents, when it originates at station *C*, may be traced from ground 17, through condenser 18, condenser 19, coil 16, and condenser 20 out to the transmission line. By the use of impedance coils 26, 27, 31, 32, connected in the quadrilateral form shown in the diagram, the telephone apparatus is guarded from the action of telegraphic currents while the shunting of opposite sides of the quadrilateral 27 31 by condensers 19 20 permits the passage of telephone current to the line.

TELEPHONE SIGNALLING SYSTEM.

John Z. Miller, Erie, Pa., patents (No. 830,161; dated September 4, 1906; filed October 30, 1902; serial No. 129,484), a selective calling mechanism for a two-party magneto line.

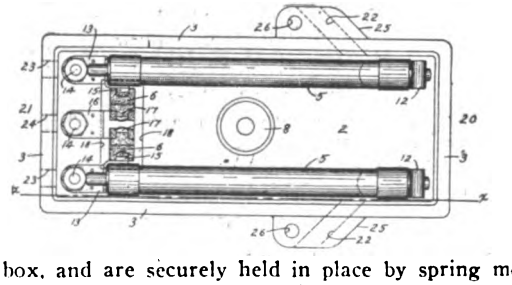
At the first station is provided a bridged bell connected in series with a 2,000-ohm impedance coil. At the other station the bell is legged to ground from a point between two impedance coils bridged across the line. The first bell is intended to be rung by alternating current conveyed in the usual way over a metallic line circuit. For ringing the second bell the operator at the exchange throws a special key, which connects one side of her generator to both sides of the metallic circuit, and the other side to ground, thus ringing the bell over the ground return.

When a call is sent in to the central office by one telephone the ringer of the other instrument is not affected; as in one case the calling current passing over the metallic circuit cannot affect the grounded ringer, while in the other the resistance of the impedance coil in series with the telephone ringer is much greater than that of the drop.

SUBSTATION PROTECTOR.

Frank B. Cook, Chicago, Ill., patents (No. 839,117, dated December 25, 1906; filed July 30, 1906; serial No. 328,424) a substation protector.

This protector is intended for outside use at substations. The casing 1 is constructed with a flat base portion 2 and raised side portions, 3, 3, which form a box deep enough to hold the necessary enclosed fuses and lightning arresters. Between the open surface of sides 3 3 and the metallic cover which is furnished with the box is laid a rubber gasket, in order to make a tight joint. The cover is secured in place by a bolt passing through a hole in the center of the raised post, 8, set in the middle of the box. In the cover a depression is provided to receive the head of the bolt so that by having the bolt head no higher than the flat portion of the cover, packing may be made convenient. The enclosed fuses 5 and lightning arrester 6 are set in planes lying respectively parallel with and at right angles to the plane of the



base of the box, and are securely held in place by spring members clamped to the base by bolts. Side lugs 25, 25 with holes 26, 26 are utilized to hold the protector in place with the end 20 at the top. Passages 22, 22 are for line wires, 23, 23 for instrument wires and 24 for ground wire.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

AMERICAN ELECTRIC FUSE COMPANY LICENSED UNDER ALL STERLING ELECTRIC COMPANY'S PATENTS.

THE American Electric Fuse Company announces that it has secured from the Sterling Electric Company, of Lafayette, Indiana, a license under all the protector patents of the Sterling Electric Company, including all the protector patents involved in the litigation between the Sterling Electric Company and Frank B. Cook. It has also secured from the Sterling Electric Company a release covering all goods heretofore manufactured by the American Electric Fuse Company, which release also covers all the customers of the American Electric Fuse Company.

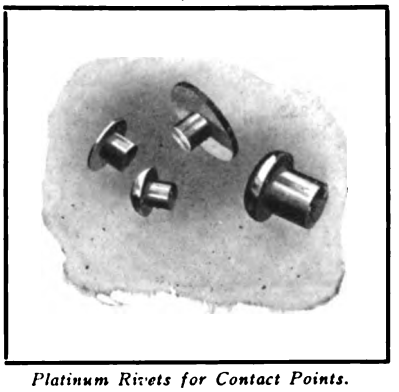
The recent decision of the United States Circuit Court of Appeals, which is the highest Court of Appeals in such cases, in favor of the Sterling Electric Company and against Frank B. Cook, therefore does not affect any customer of the American Electric Fuse Company, since all of the goods of the American Electric Fuse Company are licensed under the patents involved in that litigation.

The American Electric Fuse Company will be very glad to furnish full details concerning these patents and the decision of the United States Circuit Court and anything additional with regard to the patent situation on protectors, on request from any of its customers. This company has never been sued for infringement of any protector patent, and announces that it has been and always will be its policy to respect all the legitimate patent rights of others, and that it will guarantee protection to all of its customers against any patent suits of any kind or nature.

PLATINUM RIVETS.

ECONOMY in the use of platinum is an object much sought by telephone manufacturers.

Baker & Co., Inc., Newark, N. J., claim that their platinum rivets are made in such a form that their use for contact points makes it possible to effect a saving. By the time they are in place the cost of points made from these rivets is said to be lower than when wire is cut, finished and in place. This saving comes from the fact that with the rivets it is necessary to do no cutting of material to fit the contact point into the recess provided for it, and that the cost of labor in setting the points may be made very low.



Platinum Rivets for Contact Points.

In the accompanying illustration is shown a group of rivets of a few of the different standard forms. The company issues a sheet showing dimensions of a great many standard sizes which it manufactures, covering a sufficient range to be adapted to practically all purposes of the manufacture of telephone apparatus. This list and full information will be sent by the company upon receipt of a request.

THE STROMBERG-CARLSON EXHIBIT AT THE CHICAGO ELECTRICAL SHOW.

DIRECTING attention to the important exhibit of the Stromberg-Carlson Telephone Manufacturing Company, of Rochester, N. Y., which is now in place at the Electrical Show at Chicago, is a novel and interesting map bordered by electric lamps. An especially attractive feature of this map is the use of many electric lamps dotted over its surface at various points, each lamp representing a city or town which contains one or more operating exchanges installed by the company. When lighted at night these lamps are visible from many parts of the floor, owing to the prominent position of the company's exhibit, and attract much favorable attention.

Exhibited by the company are several classes of its standard apparatus, including a large multiple central energy switchboard, private branch exchange switchboards of various designs and capacities, telephones for both city and country use, and various other pieces of material of types generally familiar to telephone men. The exhibit as a whole is extremely attractive. It is in charge of A. M. Haubrich, Chicago manager, and Messrs. Schafer, Stigberg, Hudson and Lewis, from the Chicago office, and Messrs. J. P. Cracraft, general sales manager, Hague and Oliver, of the Rochester office. From time to time Messrs. Nate, Myers, Shafer and Menefee, salesmen whose territories are in the vicinity of Chicago, will also be present at the company's exhibit.

THE BLAKE SIGNAL & MFG. COMPANY, 246 Summer street, Boston, Mass., issues a booklet which describes the Blake signal system for electric and steam railways. The advantages of this signaling system from an operating standpoint are referred to at some length. It is shown how the Blake system, in connection with a telephone system of despatching, enables the despatcher's office to hold communication at any desired time with any desired train crew, while the necessity of stopping and calling in from every one of a number of predetermined points is avoided. In this way the time taken for useless telephone calls is saved, with the consequent benefit of increased speed of operation. Other advantages and general operating features of the system may be learned by an examination of the book which will be sent by the company to all interested persons.

THE AUTOMATIC ELECTRIC COMPANY, Chicago, Ill., is exhibiting in spaces 19 and 20, Section C, at the Chicago Electrical Show, a working "cross-section" of a 100,000-line automatic telephone system such as it will install in Chicago for the Independent Telephone Company of Chicago, the $10,000,000 company recently formed for the purpose of operating an automatic telephone system, serving the entire city, under the franchise rights of the Illinois Tunnel Company.

The exhibit consists of two of the Automatic Electric Company's new "Keith Units" of 100 switches each, connected by a trunking section and representing a portion of each of two branch exchanges, "A" and "F."

There will be twelve telephones connected up, six on each section. The equipment will all be mounted on a raised platform at the rear of the booth, separated from the rest of the booth by heavy brass railings.

The exhibit is in charge of H. H. Woodworth, advertising manager for the company, who, together with C. L. Fisher, sales manager; J. A. Russell, R. B. Tyler, J. E. Fisher and P. J. Eubanks, of the sales department, and F. Lubberger and J. S. Engh, of the engineering department, will be in attendance during the show.

FRANK B. GRIFFIN, Oshkosh, Wis., is prepared to fill orders for silk-covered magnet wire in any quantities desired. The insulating covering is carefully wound, and the manufacturer believes that his wire will fulfill all requirements necessary to be observed in the winding of high grade apparatus. He will send full information and prices upon receipt of a request.

IN THE MANUFACTURING FIELD

THE STROMBERG-CARLSON SALES ORGANIZATION'S CONFERENCE.

THE accompanying illustration was made from a photograph taken on Jan. 4th, 1907, in the Rochester, N. Y., plant of the Stromberg-Carlson Telephone Manufacturing Company. It represents in part the Sales Organization of the company.

The representatives whose portraits appear in this photograph were called together in general conference for the exchange of ideas and for planning a sales campaign for 1907. The meetings were presided over by the sales manager, Mr. J. P. Cracraft, and were held daily at 9.30 A. M. and 2.00 P. M. in the assembly hall. Evening sessions were often held. These meetings and consultations extended over a period of eight days and were eminently successful from many points of view. Members of the engineering department were prominent at these meetings. Many pieces of apparatus were brought before the meetings and thoroughly discussed. These discussions were instructive and interesting, and the exchange of ideas and the experiences of the salesmen were of much value to both the inside and outside men.

A list of the representatives present as shown above, together with their respective territories, follows:

Mr. J. P. Cracraft, sales manager.

Mr. H. A. Jones, representative from New Jersey, Delaware, District of Columbia.

Mr. T. E. Wright, Virginia, West Virginia, Maryland, Pennsylvania and New York City.

Mr. J. A. Helvin, from North Carolina, South Carolina, Florida and Georgia.

Mr. F. C. Redfield, representative from the New England States and the eastern provinces of Canada.

Mr. B. J. Mockenhaupt, from Chicago office.

Mr. C. S. Sifferd, from Kansas, Oklahoma and Indian Territory.

Mr. F. W. King, Rochester office.

Mr. J. B. Wilkinson, Kentucky, Tennessee, Mississippi and Alabama.

Mr. J. J. Nate, North Dakota, South Dakota, Minnesota and Montana.

Mr. H. C. Slemin, Rochester office.

Mr. A. J. Kennedy, New York State.

Mr. A. M. Haubrich, manager Chicago office.

Mr. B. C. Hyde, Missouri.

Mr. Wm. Bowen, Sr., Iowa.

Mr. C. W. Schafer, Rochester office.

Mr. A. B. Crawford, Ohio.

Mr. E. A. Reinke, sales department, Rochester office.

Mr. E. P. Shafer, Indiana.

Mr. J. S. Gibson, representative in Canada, with sales office and warerooms at 60-62 Front street W., Toronto, Ont., Can.

Mr. J. H. Wagner, recently in Chicago office, now located in Rochester sales department.

Mr. C. E. Hague, sales engineer at Rochester office.

Mr. S. W. Menefee, Michigan and Wisconsin.

Mr. D. C. Gould, Nebraska and Colorado.

Mr. P. D. Myers, Illinois.

Mr. C. F. Speed, New Mexico, Texas, Arkansas and Louisiana.

Mr. J. O. Oliver, advertising department.

Without exception the men returned to their respective fields of operation greatly benefited by the week's conference and with the firm determination of accomplishing even greater results than have been attained in the past.

THE W. G. NAGEL ELECTRIC COMPANY, Toledo, O., reports a large demand for the Robinson distribution rack. This is stated by its users to enable them to effect considerable economy in construction, as its sectional form enables them to add new supports as required. The company will send full information to all interested persons.

THE WEEK'S MESSAGES

NEW COMPANIES.

CRESTED BUTTE, COL.—Articles of incorporation have been filed by the Crested Butte Telephone Company. It has an authorized capital stock of $10,000, and the incorporators are J. W. Rockefeller, S. G. Robinson and Angus Taylor, of Crested Butte.

DAVIS, ILL.—The People's Mutual Telephone Company, of Davis, has been incorporated with a capital stock of $10,000, divided into shares of $50 each. Among the incorporators are J. W. Johnson, William Arnsmeier and Fred Alberstett.

ROCHESTER, IND.—The Farmers' Co-operative Telephone Company has been organized to operate in Fulton, Marshall, Miami, Wabash, Kosciusko and Whitley Counties. The capital stock is placed at $10,000.

SILVER LAKE, IND.—Articles of incorporation have been filed by the Farmers' Co-operative Telephone Company, of Silver Lake. The company has a capital stock of $10,000, and the incorporators are Thomas E. Ball, James Paxton and Isaac Shoemaker.

ODEBOLT, IA.—The Eden Mutual Telephone Company has been incorporated in Eden township with a capital stock of $5,000.

NEODESHA, KAS.—The Verdigris Valley Telephone Company has recently been organized with the following officers: H. E. G. Miller, president; L. B. Hutchins, vice president; William Basore, secretary; Tom Tazen, treasurer; C. E. Kerwin, W. F. Gray and Peter Beurskin, directors.

PECK, KANS.—The Peck Mutual Telephone Company, Peck, Kans., has filed articles of incorporation.

SEWARD, KANS.—Articles of incorporation have been filed by the Seward Telephone Company, of Seward, Kans.

HOUGHTON, MICH.—A movement is on foot in Houghton looking toward the organization of an Independent telephone company to compete with the Bell Company. It is understood that influential capitalists in Houghton and Chicago are back of the project.

ELLENDALE, MINN.—The Ellendale Rural Telephone Company, with a capital stock of $10,000, has been incorporated. The incorporators are W. A. Stanton, W. E. Calloway and E. M. Thompson.

SEBEKA, MINN.—Articles of incorporation have been filed by the Sebeka Telephone Company, of Sebeka, Wadena county. The company has an authorized capital stock of $10,000, and among the incorporators are O. V. Johnson, F. C. Haverkost and W. R. Kewen, all of Sebeka.

LAUREL, MISS.—Owing to the increase in rates by the Cumberland Telephone Company, the citizens of Laurel are taking steps to organize an Independent company to operate between Laurel and Ellisville. Stock subscriptions are now being solicited by the promoters of the movement.

VICKSBURG, MISS.—Owing to the unsatisfactory service being rendered by the Cumberland Company in Vicksburg, a number of prominent business men of that city are discussing a company to install a home plant with modern equipment. Local capitalists will control the corporation, and arrangements will be made for both local and long distance service.

KAHOKA, MO.—The Gates Telephone Company, with headquarters at Kahoka, has been incorporated with a capital stock of $10,000.

BLAKESLEE, PA.—The Blakeslee and Fern Ridge Telephone Company has been organized, and will construct lines between Blakeslee, Fern Ridge and Pocono Lake, with long distance connections at Stroudsburg. Among those interested in the new enterprise are James Warner, Frank Blakeslee, George Wagner, Edward Hawk, George Hamil and Philip G. Henning.

CASCADE SPRINGS, S. D.—A new Independent telephone company, to be known as the Cascade Telephone Company, has been incorporated at Cascade Springs. The company will start business with a capital of $1,500, and the incorporators are A. S. Beebe, Henry Fruday, W. P. Hamelstrom and Fred Nunenberg.

MOAB, UTAH.—The Blue Mountain Telephone and Electric Company has filed articles of incorporation. It has a capital stock of $10,000, and the following officers have been elected: President, D. L. Goudelock, Moab; vice president, J. M. Cunningham, La Sal; treasurer, V. P. Martin, Moab; secretary and manager, J. N. Corbin, Moab. The principal place of business is to be at Moab, and it is the company's intention to construct and maintain telephone lines and exchanges in all parts of the states of Utah and Colorado.

DIAMOND, WASH.—The Diamond Telephone Company, of Diamond, has been incorporated with a capital stock of $2,000. Among the incorporators may be mentioned F. W. Ertel, W. M. Lee and Henry Rock.

MATTESON, WIS.—Articles of incorporation have been filed by the Matteson Telephone Company, of Matteson, Waupaca county. It has an authorized capital stock of $6,000, and the incorporators are L. A. Burgess, C. G. Fergot and Noyes Matteson.

FRANCHISES.

CARLINVILLE, ILL.—The Macoupin Telephone and Telegraph Company has applied for a franchise at Carlinville.

WALKER, IA.—Application has been made by the Farmers' Mutual Telephone Company to construct and operate a telephone system at Walker.

MEMPHIS, MICH.—The common council of Memphis has granted a telephone franchise to F. S. Church, of Port Huron.

FINANCIAL.

MOBILE, ALA.—The directors and officers of the Home Telephone Company have voted to increase the preferred stock from $20,000 to $150,000, and the common stock from $350,000 to $500,000.

LOUISVILLE, KY.—The Kentucky Telephone Securities Company has made an offer to take over the control of the Louisville Home Telephone Company, and to guarantee a dividend of 5 per cent. It is said that the new company intends to make extensive improvements, and that not only the fund of $50,000, but the whole stock of the Securities Company, amounting to $1,000,000, is responsible for the payment of the 5 per cent. dividend.

BUTTERNUT, MICH.—At a recent meeting of the Farmers' Exchange Telephone Company, the capital stock was increased from $2,000 to $12,000, and the number of directors increased from three to five.

GRAND RAPIDS, MICH.—At a recent meeting of the Citizens' Telephone Company, the regular quarterly dividend of 2 per cent. was declared, payable January 19.

ST. LOUIS, MO.—The board of directors of the Kinloch Long Distance Telephone Company has declared the regular quarterly dividend of 1¼ per cent on the capital stock of $2,800,000, payable January 15.

TECUMSEH, NEB.—The stockholders of the Home Telephone Company are receiving their quarterly dividends amounting to a rate of 8 per cent. per annum.

HANNIBAL, O.—The capital stock of the Hannibal and Round Bottom Telephone Company has been increased from $2,500 to $5,000.

COLUMBIA, PA.—The Columbia Telephone Company, which began business ten years ago with a capital of $5,000 and forty-two subscribers, now has over 700 subscribers, and its capital stock has been increased to $75,000.

MEADVILLE, PA.—At a recent meeting of the Eastern Crawford Telephone Company it was decided to increase the capital stock from $20,000 to $50,000. The increased capital is to be used in extending the company's lines.

COMBINATIONS.

MACOMB, ILL.—Plans are under way for the union of all farmers' lines in McDonough county, with headquarters at Macomb.

ELECTIONS.

STUTTGART, ARK.—The Arkansas Mutual Telephone Company has elected the following officers: I. Thacker, president; Robert Blohm, vice president; R. G. Harper, secretary; J. C. Jackson, treasurer.

CORONA, CAL.—The following directors have been elected by the Corona Home Telephone and Telegraph Company: R. F. Billings, D. M. Browning, W. J. Pentelow, S. S. Willard, J. C. Gleason, J. P. Triolo and A. C. Wood.

LONE STAR, CAL.—The Star Telephone Company has elected the following officers: Ed. Gassaway, president; W. C. Peaslee, secretary; Herman Oost, vice president; Wm. Cramer, treasurer; Ed. Ridinger, assistant secretary.

YAMPA, COL.—The following directors have been named by the newly organized Routt County Mutual Telephone Company: A. C. Bower, H. J. Hernage and John Dunckley.

ROCKFIELD, ILL.—At the annual meeting of the Rockfield Co-operative Telephone Company the following officers were elected: John Kerlin, president; A. L. Surface, vice president; P. W. Van Gundy, secretary; Thomas Robinson, general manager; trustees, Samuel Clauser, C. L. Million and A. M. Rankin.

YEOMAN, IND.—The following officers have been elected by the Yeoman Co-operative Telephone Company: President, E. O. Teach; secretary, William M. Goslee; treasurer, George Breeze; directors, John Million, Charles Ginn, Martin M. Baum.

CAMDEN, MICH.—The following officers and directors have been elected by the Camden Rural Telephone Company: President, Henry Haynes; vice-president, Chas. Cook; secretary, Chas. Small; treasurer, B. R. Allward; directors, S. B. Goodman, Jas. Crow, W. J. Pease, F. W. Rowe and S. S. Townsend.

CERESCO, MICH.—At a meeting of the North Marshall Telephone Company at Ceresco the following officers were elected: President, Fred Lutz; vice-president, Dr. Gubbons; secretary, P. M. King; treasurer, Albert Fohr.

STILLWATER, MINN.—The Fairy Falls Rural Telephone Company has named George Jarchow as president; John Nelson, as vice president; Christ. Frazer, secretary-treasurer; James Leslie, Robert Harrigan and Emil Jarchow as directors.

COLUMBUS, NEB.—At the annual meeting of the Platte County Telephone Company C. J. Garlow was elected president; G. T. Everett, vice president; R. V. Lisco, second vice president; A. Anderson, treasurer; T. J. Cottingham, secretary and manager.

THE WEEK'S MESSAGES

GREENE, N. Y.—The newly elected officers of the Chenango Valley Telephone Company are: President, J. H. Lenderson, of Greene; vice-president, E. H. Alderman, Castle Creek; secretary, F. E. Page, Greene; treasurer, William Ransom, Glen Castle; general manager, Frank H. Williams, Greene.

ROCHESTER, N. Y.—The following directors have been named by the Stromberg-Carlson Telephone Manufacturing Company: J. C. Woodbury, P. M. French, William A. E. Drescher, H. P. Brewster, A. J. Katz, Albercht Vogt, G. W. Peck, J. C. Powers and C. F. Lomb.

MISCELLANEOUS.

WASHINGTON, D. C.—The signal office of the army is purchasing more than 500 telephones for use in the fire control systems at various points along the Pacific Coast. The installations will be begun at the several defenses on Puget Sound.

CAIRO, ILL.—The name of the Cairo Telephone Company has been changed to the Home Telephone Company, of Cairo.

ST. JOSEPH, ILL.—The St. Joseph Telephone Company has been purchased by L. F. Schwerdtfeger, of Lincoln, Ill., who will make many improvements in the system.

ROCKFORD, ILL.—It is the intention of the Independent Telephone Company, of Rockford, Ill., to connect with the Independent Company, of Brodhead.

MONTICELLO, IND.—An agreement has been entered into between the Monticello Telephone Company and the Idaville Co-operative Telephone Company for an exchange of service.

SPURGEON, IND.—The Home Telephone Company expects to form connections with the Independent Telephone Company at Oakland City.

AUBURN, NEB.—The controlling interest in the Auburn Telephone Company has been sold by the president, J. C. Killarney, to the following business men of the city: E. Ferneau, E. M. Boyd, H. A. Lambert, O. R. Young, H. E. Furlong, R. C. Boyd, Geo. Codington, W. W. Harris and S. W. Eustice. It is the intention of the new owners to spend about $15,000 in improving the plant. Mr. Killarney will have active management of the affairs of the company.

NACOGDOCHES, TEXAS.—Within six hours of the burning of the exchange of the South Texas Telephone Company, at Nacogdoches, the general manager, J. B. Earle, placed an order for new equipment. A new multiple central energy board, with 540 lines equipped, is to be installed. It is said that the board was to have been shipped within eight days of the time of the fire, so that the company will speedily resume operations.

BROWNTOWN, WIS.—Arrangements have been made with the United Telephone Company by which the Browntown Telephone Company secures the benefit of Monroe service for its subscribers.

PERSONAL.

JOHN R. ALEEN has recently assumed management of Northwestern Telephone Exchange Company's plant at St. Cloud, Minn.

S. M. GREER, until recently secretary to Mr. U. N. Bethell, the vice-president of the New York Telephone Company, president of the New York & New Jersey Telephone Company, and also president of several other telephone companies in the East, has been appointed contract agent of the Long Island division of the New York & New Jersey Telephone Company. He succeeds Mr. A. R. Pardington, who resigned his position to become vice-president and general manager of the new Long Island Motor Speedway Company.

LUTHER HAWKINS has been promoted to the management of the exchange of the Southern Bell Telephone & Telegraph Company at Americus, Ga.

C. M. MAUSEAU has been promoted from the position of assistant general manager to that of general manager of the Northwestern Telephone Exchange Company in Minneapolis, Minn.

F. E. MONTAGUE, formerly State superintendent of the Southern Bell Telephone and Telegraph Company, with headquarters at Richmond, Va., has recently gone to Atlanta to take a newly created position, with the title of Superintendent of Exchange Traffic.

New Construction in the Field

WILLOW, CAL.—It is the intention of the Colusa County Telephone Company, which is now constructing a line at Willow to build lines throughout Colusa County, Glenn County and the northern part of the Sacramento Valley.

MIAMI, FLA.—Many improvements are being made in the system of the Miami Telephone Company.

SODA SPRINGS, IDAHO.—A private telephone system is being installed by the Telluride Power Company from Soda Springs to Alexander.

HILLVIEW, ILL.—The Illinois Telephone Company contemplates the erection of a toll line from Hillview to Pearl, to connect with the Pike County Telephone Company.

AUBURN, IND.—Many improvements and extensions are to be made by the Home Telephone Company, of Ft. Wayne, in its system at Auburn.

MONTICELLO, IND.—A new switchboard is to be installed by the Monticello Telephone Company.

MOORES HILL, IND.—A new exchange is to be installed by the Moores Hill Telephone Company. It is the company's intention to exchange free service with the new exchange at Milan.

SHELBYVILLE, IND.—Among the improvements planned by the Smithland Telephone Exchange Company is the installation of a new switchboard.

VAN BUREN, IND.—The Independent Telephone Company at Van Buren has rebuilt its entire system.

ARDMORE, I. T.—The Chickasaw Telephone Company has expended about a quarter million of dollars in the past six months on improvements at Ardmore and on long distance lines leading out of Ardmore.

GLIDDEN, IA.—Among the improvements planned by the Glidden Telephone Company is the erection of a line to Carroll.

OSKALOOSA, IA.—The lines of the Home Telephone Company are to be extended in Oskaloosa.

IOLA, KANS.—The lines of the Iola Telephone Company are being greatly improved and extended.

PIQUA, KANS.—The Enterprise Telephone Company is to build new lines in East Piqua.

CAIRO, MICH.—Many new lines are being built by the Moore Telephone Company at Cairo.

CHARLOTTE, MICH.—Improvements are being made by the Eaton County Telephone Company in its system at Charlotte.

ELK RAPIDS, MICH.—The Citizens' Telephone Company is extending its lines in Elk Rapids.

GRAND RAPIDS, MICH.—The Citizens' Telephone Company, of Grand Rapids, is installing a new system at Holland. A building has been purchased for its exchange, considerable conduit work done, and the cable plant and improvements will represent a cost of $60,000.

LANSING, MICH.—The Citizens' Telephone Company contemplates the expenditure of about $100,000 in the improvement of its system. The erection of a new telephone building is being considered by the company.

ALAMOGORDO, N. M.—The Sacramento Telephone Company, recently incorporated, is about to commence the construction of its system.

NORTH GAGE, N. Y.—Many improvements are to be made in the lines of the Farmers' Telephone Company.

NORWICH, N. Y.—The telephone system owned by J. B. Marquis is to be improved by the installation of a new switchboard and the construction of new lines.

ERIE, PA.—The Mutual Telephone Company is building a sixty-foot addition to its local exchange, and is to double its equipment and facilities to take care of its increased business. A new switchboard which will provide connections for 10,000 telephones is to be installed, and it is the company's intention to make its plant first-class in every particular.

SPOKANE, WASH.—Plans are being made by the Interstate Telephone Company to extend its lines to the Coeur d'Alene mining district. It is estimated that the total cost of the improvements will amount to $125,000. A new two position switchboard is being installed at Sandpoint, and lines are being built from Sandpoint to Laclede.

HYATTVILLE, WYO.—The Farmers' Telephone Company is constructing additional lines in Hyattville.

UNDERGROUND.

INDIANAPOLIS, IND.—The Board of Public Works is considering the advisability of compelling the telephone companies to place their wires underground in certain parts of the city.

COLDWATER, MICH.—The Wolverine Telephone Company has under construction some underground work at Coldwater.

ST. PAUL, MINN.—An ordinance has been introduced in the common council of St. Paul to extend the limits compelling telephone companies to place their wires in conduits.

CAMDEN, N. J.—The Keystone Telephone Company desires to place its wires underground in Camden.

KENTON, O.—Considerable conduit work is to be included by the Kenton Telephone Company in its contemplated improvements at Kenton.

GREENSBURG PA.—The Pittsburg-Johnstown Telephone Company is considering the advisability of establishing a conduit system at Greensburg.

WAYNESBURG, PA.—Considerable conduit work is to be done by the Greene County Telephone Company at Waynesburg, Pa.

BENWOOD, W. VA.—The National Telephone Company is to place its wires under ground in some of the streets of Benwood.

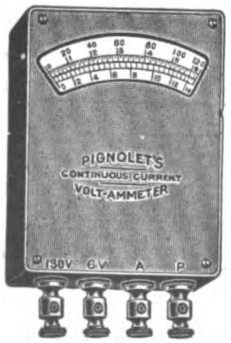
CHEAP VS. EFFICIENT SERVICE



The cheapest telephone service in the world is dear at any price if it is not efficient.
When a man installs a telephone he wants to be able to use it and not to abuse it.
A grounded line nine times out of ten is noisy, and foreign noise on a telephone line will arouse a feeling of anger in the heart of the user that isn't good for the company. You can keep your lines free from grounds and other troubles by periodic tests with a Pignolet voltmeter, and when they do occur, you can locate them with this instrument, and get them cleared often before the subscriber knew his line was in trouble.
If you need your subscribers' good will, you need my voltmeter to get it.
LOUIS M. PIGNOLET, Originator of the Voltmeter Habit
78 CORTLANDT ST., N. Y.

The Facts at a Glance

The accompanying detail drawing emphasizes four important facts about the Gould Storage Battery Plate.

1. The ribs forming the contact surface are part and parcel of the grid and frame.
2. Ample longitudinal and lateral conductors secure uniform current distribution.
3. Active material will not fall out, so that the plate retains its initial capacity during its long life.

Full descriptive literature upon request.

JUST A SUGGESTION

Take one of your busy 4-party lines and equip it with "POOLE" Lock-Outs. Leave it in service a month and then see how many of the four will stand a raise of $3.00 a year rather than go back to the old way. We know the answer, but we want your subscribers to impress on you the fact that the "POOLE" Lock-Out is a rate-raiser.

It won't cost you anything to try it, because we will loan you the Lock-Outs free and there is no other equipment required. Write today for our Booklet AL-2.

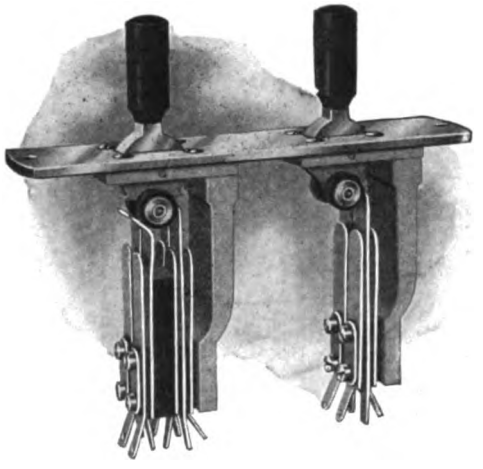
DEAN TELEPHONE APPARATUS

EXPRESS SWITCHBOARD KEY



In the last two issues we have told you about some of our express type switchboard apparatus. This week we call attention to one of our cord circuit keys, which is shown in the accompanying illustration.

The key attached to the left-hand end of the escutcheon is a combined listening and ringing key for listening across the cord circuit and for ringing on the front cord, while the other key is for ringing on the back cord.

The framework of these keys is made very rigid from heavy brass stock. The cams are in one piece, with stops to limit their movements, while the cam handles are attached by large steel screws which are sufficiently long to reinforce the parts and prevent breakage. The rollers for preventing friction of the cams on the springs are securely fastened so that there is no chance for them to work loose. The springs are special German silver, with riveted platinum contacts, while all of the insulation is hard rubber.

These keys have a very easy and positive action, with no sliding friction, thus insuring indefinite life.

See our folder No. 6 for further description of our express type switchboards, a copy of which will be mailed to you, free, on request.

It will pay you to investigate. "We give more value for the same money."

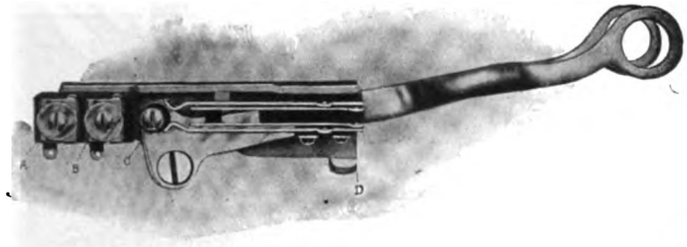
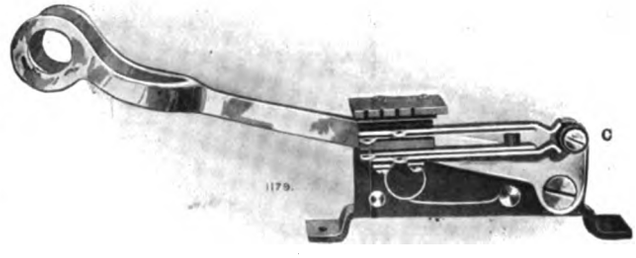
Stromberg-Carlson Efficiency and Durability are well and favorably known. The accompanying illustrations show two styles of Hook-switches, which for simplicity and mechanical construction are characteristic of Stromberg-Carlson Apparatus.



The movement of the hook downward causes the hard rubber insulated pin (C) to be drawn in between the German Silver springs, thus breaking contact, while the upward movement of the hook allows them to come together and close the circuit. The very best of materials only are used. Thorough reliability and the highest efficiency are guaranteed. Manufacturers of Telephones and Switchboards of the highest grade for all classes of service.



If you will mention your requirements and this advertisement, descriptive bulletins will be mailed free.

TOLL LINE SIGNAL

This signal is made up of standard ringer coils and a regular jack. The striker rod of the ringer has a projection beyond the striker ball which engages the drop. The mounting plate is just twice as large as the plate for five Monarch drops and jacks, so two ringers, drops and jacks occupy the space of ten drops and jacks. Our catalogue describes this toll line signal.

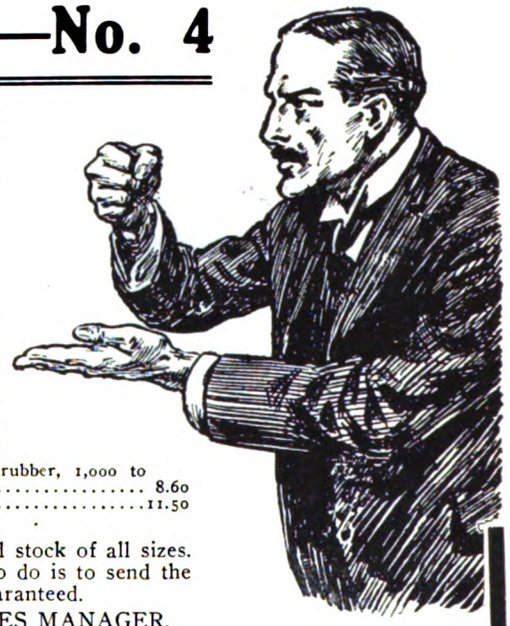
Talks With The Buyer—No. 4



The number of answers that I received to my last talk, asking for free samples of our Ajax battery with which to make test, encourages me greatly, answers having come from great distances. The Ajax battery offer is still open; read my last talk. Now I want to call your attention to our especially attractive prices on

Rubber Covered Telephone Wires

By the placing of contract for an enormous quantity we were enabled to secure, before the advances, a particularly attractive price, of which we are giving the benefit to our customers. Prices will talk better than words. Here are a few:

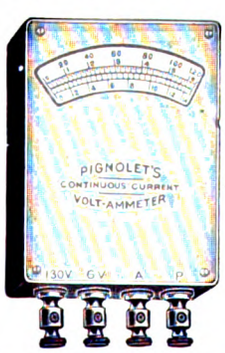
No. 532, No. 19 gauge single conductor plain rubber, no braid, lots of 1,000 to 5,000 ft., per M.....$3.25
No. 533, No. 19 gauge single conductor saturated braid, 5/64 rubber, 1,000 to 5,000 ft., per M..... 4.25
No. 18, 3/32, 1,000 to 5,000 ft..... 5.55
No. 534, No. 19 gauge rubber conductor, 5/64 plain rubber insulation, no braid, one red, one black, 1,000 to 5,000 ft., per M..... 6.50
No. 538, No. 19 gauge double conductor, braided, one conductor with tracer, 5/64 rubber, 1,000 to 5,000 ft., per M..... 8.60
No. 18 gauge, 3/32 insulation, otherwise same as above.....11.50
No. 539, same as No. 538 except saturated braid for outside use; same prices.

The wire is highest quality. We carry an enormous and well assorted stock of all sizes. I don't need to talk very much about wire at such prices. All you have to do is to send the orders in. Better do it now. Add the other goods you need—prices guaranteed.

THE SALES MANAGER.

CENTRAL TELEPHONE & ELECTRIC CO., Makers of High Grade Apparatus, Dealers in Telephone Supplies **St. Louis AND Dallas, U. S. A.**

LOOKING FOR TROUBLE?



Suppose you have a line in trouble—grounded or open. You don't know the exact location, but you send out a troubleman to hunt it up and clear it. It may take him an hour or a day. Meanwhile the subscriber is getting hot under the collar and saying things about telephones in general and yours in particular.

If you have a Pignolet voltmeter or volt-ammeter you can determine the approximate location and also get an idea of the nature of the trouble. With the information your troubleman can find the fault in jig time, and you will have prevented the subscriber kicking by giving him service at the earliest possible moment.

Does it pay to be informed? You ought to know.

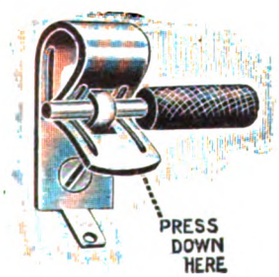
WHEN you have had to travel or send someone miles to tighten a loose connection on a dry battery or when you have had occasion to connect and disconnect the wires to a dry cell many times successively, or when you have had to connect a wire to a dry battery when the battery was on a shelf or in a battery box—at such times haven't you felt like saying something about dry battery connections generally. You wouldn't if your batteries had been fitted with

FAHNESTOCK SPRING BINDING POSTS



for it is such an easy matter to connect and disconnect the wires; and they never get loose.

It is only necessary to press down on the spring, slip in the wire and let go. The spring does the rest and makes perfect contact. Where it is necessary to change the wires often; where it is necessary that the connection should be secure; where it is necessary to make connections inside of a battery box, Fahnestock spring binding post is invaluable. Send for our booklet, showing various styles for different purposes.

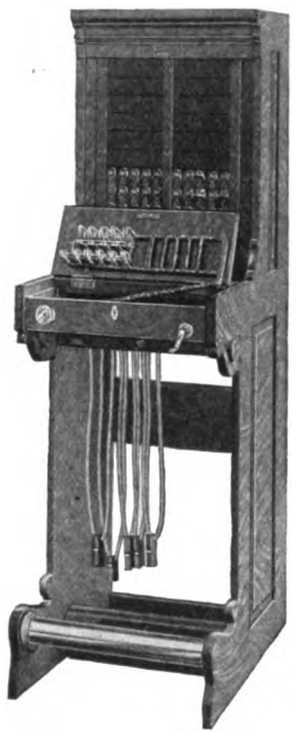
KELLOGG

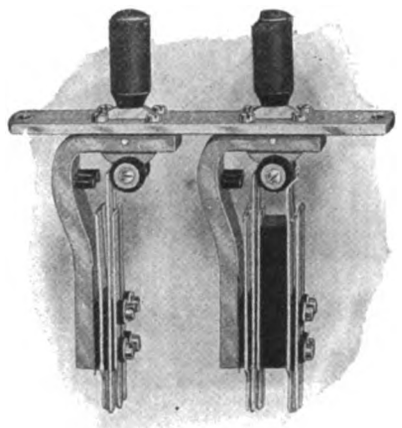
TELEPHONE APPARATUS

MAGNETO SWITCHBOARDS

CONTAIN KELLOGG

RINGING AND LISTENING KEYS





This Ringing and Listening Key (No. 41) and Ring-back Key (No. 33) is mounted on one escutcheon which permits the mounting of the Key directly onto the wood of the Key-shelf. This combination of keys is used on all of our Express-type Switchboards.

Key No. 41 is self-locking in the listening position.

Both No. 41 and No. 33 Keys automatically restore from the ringing position when released.

The cams are provided with rollers which cut down friction and wear and completely eliminate sticking.

All springs are of German silver, of good length, pure platinum contacts. They are mounted on a heavy brass frame, and are thoroughly insulated from each other and the frame by hard rubber blocks. In their operating position the keys stand upright, making it impossible for dust to collect between the contacts. The escutcheons are heavily nickel-plated and the key handles are of knurled hard rubber.

The cost of platinum has advanced so much that most manufacturers are now using silver as a substitute. All parts advertised by the Kellogg Company as platinum *arc platinum*. We use no substitutes. Our apparatus will stand any legitimate tests. It is guaranteed.

Write for "Bulletin No. 9A" which completely describes Magneto Switchboards.

You Wouldn't Start a Horse Car Line

in this age of electric cars? Not if you wanted to make money out of the business of transportation.

Then why should you start a manual telephone exchange in this age of automatics, if you want to make money out of the telephone business?

The automatic system of telephony bears the same relation to the manual system that the electric car does to the horse car. It is the apotheosis of telephone development, as the electric car is of transportation development.

The automatic telephone system produces the best service more economically than indifferent service can be produced with manual equipment.

There is no more question as to the relative popularity of the automatic and manual telephone service where the two kinds are in competition than there is as to the relative popularity of the trolley car and the horse car.

And, as for the securities—the same comparison may be applied with the same results.

Our Automatic system has been adopted in the following cities:

Aberdeen, S. D.	Clayton, Mo.	Jonesboro, Ark.	Ocean Park, Cal.	Springfield, Mo.
Akron, Ohio.	Cleburne, Texas.	Lake Benton, Minn.	Pentwater, Mich.	St. Marys, Ohio.
Albuquerque, N. M.	Columbus, Ga.	Lewiston, Me.	Portland, Me.	Tacoma, Wash.
Allentown, Pa.	Columbus, Ohio.	Lincoln, Neb.	Portland, Ore.	Toronto Jct., Can.

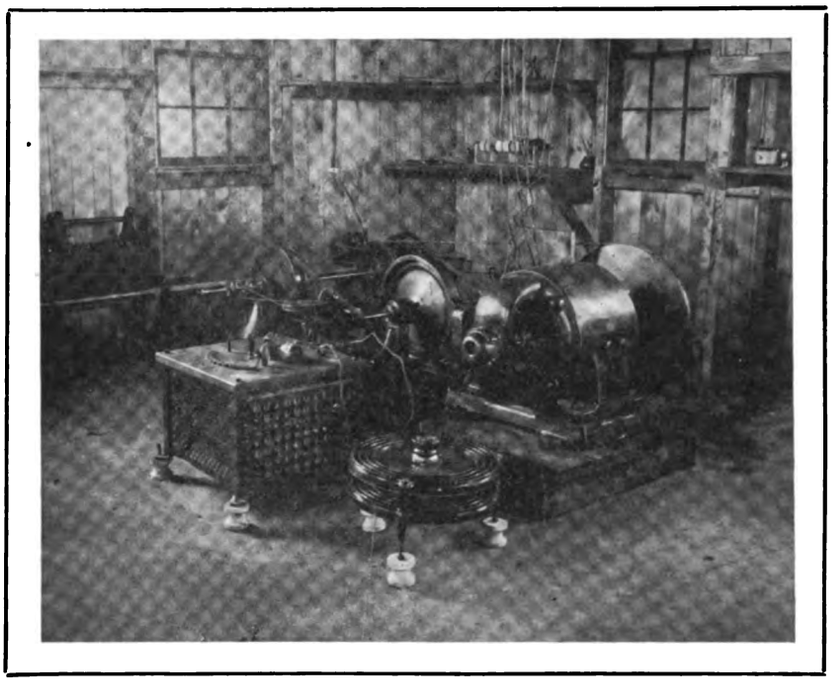
Experiments and Results in Wireless Telephony

By John Grant.

WIRELESS transmission of speech over a distance somewhat greater than ten miles was satisfactorily accomplished in the presence of a number of persons invited to witness a demonstration of a new system of wireless telephony at the experimental station of the National Electric Signaling Company, Brant Rock, Mass., on Dec. 21st, 1906.

The representative of The American Telephone Journal who was present at these tests was furnished by Professor Reginald A. Fessenden, the inventor of the system, with many facts which have made it possible to trace in the present article the development of his work. For this purpose abstracts without quotation will be freely made from an article which has been furnished by him for publication in the *Electrical Review*, London, and from descriptions embodied in United States patents which have already been issued.

Speaking broadly, wireless telephony by this system is accomplished by generating a practically continuous succession of electromagnetic waves, modifying the character of the emitted impulses by means of sound waves without interrupting their continuity, and receiving them in a constantly operative receiver of suitable form which controls a local circuit containing a battery and telephone receiver. The apparatus which was seen in successful use at the time of the recent tests is the result of a series of diligent investigations in which a large amount of work was done only to show the necessity of rejecting plans which did not definitely lead to the desired quality of transmission.



A Corner in the Laboratory at Brant Rock, Showing New High Frequency Alternator, the Source of Energy for Wireless Telephone Experiments.

Beginning his work on the subject in 1898, Professor Fessenden made some experiments which were entirely unsuccessful. At this time the only recognized means for the practically continuous generation of electromagnetic waves capable of being propagated through space to affect a distant receiving instrument were:

(*a*) The plain aerial with spark gap used by Marconi.

(*b*) The plain aerial heavily loaded with inductance, used by Lodge.

(*c*) The plain aerial in conjunction with a local oscillatory circuit having a period of a different order of magnitude from the period of the antenna, used by Braun.

Lodge's method was found to be the only one adapted to produce prolonged trains of waves. Tietz at an early date had used Leyden jars connected across the spark gap, and later Braun described and used a Leyden jar and antenna sending circuit in which the natural period of the Leyden jar circuit was specified as of a different and lower order than that of the antenna circuit.*

None of these methods, however, gave the results desired. Professor Fessenden conceived the idea that good results could be obtained by the use of an antenna in conjunction with a local circuit tuned to the same frequency as the aerial.†

This method, used by him in association with Professor Kintner, proved to give a fairly satisfactory means of producing a long train of waves, and is now extensively used. After making various tests with a Wehnelt interrupter and other devices with which more or less encouraging results were obtained, an induction coil and commutator were settled upon as a make and break mechanism for the tuned circuit. With this circuit, and apparatus giving 10,000 sparks per second, the experiments in wireless telephony led to the transmission of speech, which was first accomplished in the Fall of 1900. The antennae were two masts, 50 feet high, set up one mile apart at Rock Point, Md. A commutator making 10,000 breaks per second in circuit with an induction coil was used for generating waves.

In these experiments the articulation was of a sort which left considerable room for improvement, and there was a noise, due to the irregularity of the spark, which was always extremely disagreeable and at times overpowering. This led to the invention of the compressed gas spark gap,‡ which gave a steadier spark. This device is essentially a spark gap having its terminals, 4, 5 (Fig. 1), enclosed in a chamber in which the gas may be subjected to a pressure produced by the pump 8. This spark gap is connected between the ground and the antenna, shunting the source of energy, the circuit of which contains a make and break device. In practice the chamber was filled with compressed air,

Digitized by Google

from which the oxygen was absorbed by lime in the bottom of the chamber, leaving compressed nitrogen. The appearance of the exterior of the apparatus is shown in Fig. 2. Later a mercury gap of the Cooper-Hewitt type was used, but with this the results obtained were not quite as good as with the compressed gas gap, even when the spark was localized as much as

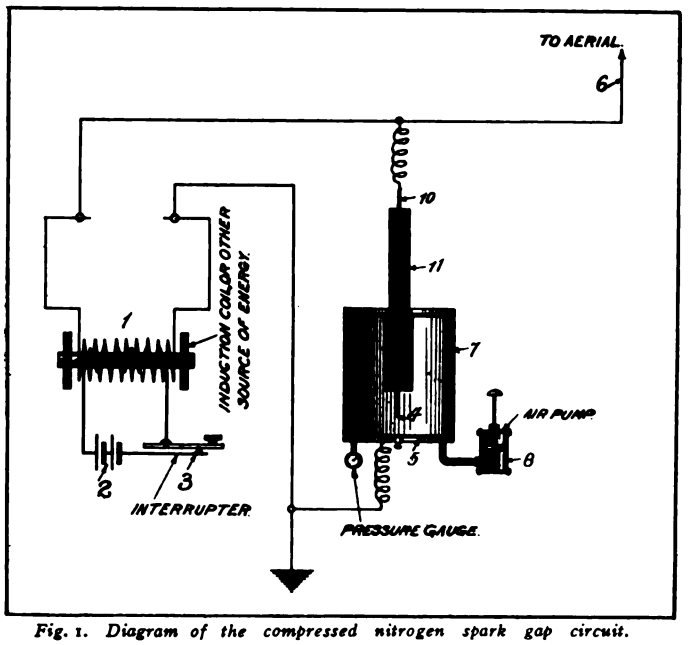

Fig. 1. Diagram of the compressed nitrogen spark gap circuit.

possible by small points of platinum-iridium wire projecting to the surface of the mercury.

With these types of apparatus high speed breaks of various kinds were used. In 1901 and 1902 experiments were made, using Elihu Thomson's method of producing rapid oscillations by means of an arc and shunted resonant circuit. Better results were obtained by a modification of this method, using regulating resistance, compressed gas gaps and governing circuits for the purpose of making it more applicable to practical working, but there was still a very considerable amount of foreign noise in the telephone circuit.

Work on high frequency alternating current dynamos had been begun in 1900, and in 1902 an alternator giving 10,000 cycles per second was completed at the works of the General Electric Co. and delivered to Professor Fessenden. This was a 1 kilowatt machine, delivering about 10 amperes at 100 volts. With it was used an air core transformer giving about 10,000 volts, and an interrupter producing 20,000 sparks per second. It was necessary to use the spark gap, as the frequency of the machine was not high enough for the direct production of electromagnetic waves. This combination, however, on account of the regularity of its action, gave much better results than the rotating break, and measurements made in Washington in 1904 led to the belief that transmission could be effected over a distance of 25 miles.

Continued experiments were made with spark gap apparatus of various types, and in many cases fairly good articulation was obtained. With all these types of apparatus, using a spark gap, however, while radiation was sufficiently continuous for the transmission of speech, it became more and more evident that the quality of articulation demanded for commercial telephony could not be obtained without a source of power which would give completely continuous radiation. Among the many methods for obtaining this which were tried was the very interesting method of producing high frequency oscillations commonly known as the musical arc, using a continuous current arc shunted by a condenser and inductance in connection with a magnetic blow out, invented by Professor Elihu Thomson.

Professor Fessenden as early as 1898 had by his experiments verified the statement made by its inventor* that frequencies as high as 50,000 or more can be obtained in this way. This statement, it is interesting to note,. was controverted as late as 1903 by Duddell,† who seems to have not fully grasped the method of operation of the device, although many European scientists have even incorrectly attributed its invention to him.

The experiments made with this method of producing oscillations showed it to be hardly satisfactory. By the use of properly cooled electrodes and an air blast and magnetic blow out, very high frequencies were obtained, but it was found that neither frequency nor intensity was constant. The fact that a key could not be used to make and break the circuit, since the arc would not start itself, made it impracticable in its original shape.

In order to overcome the difficulties arising from irregularity, the plan was modified by the substitution for a pure inductance in series with the arc of a coil having a considerable resistance with only a moderate amount of self-induction. This resistance was so adjusted and proportioned to the shunt resonant circuit as to maintain the frequency almost absolutely constant.‡

In Fig. 3 the coil 59 is shown in series with the arc in the sending circuit. It is so designed as to have a high resistance but low inductance, and any suitable means, such as a plug, 60, may be provided for shunting out more or less of the resistance. In operation, when condenser 12*a*, has been charged to a sufficient potential, there will occur a discharge across the spark gap, discharging the condenser and setting up oscillations in the sending conductor. On account of the high resistance, 59, some time is required to recharge the condenser to sparking potential. The discharge is therefore intermittent, and may be made to occur as many times per second as is desired, within recognizable limits, by plugging out more or less of the resistance. With this apparatus the periodicity depends upon the discharge voltage, which is not liable to fluctuate.

To overcome the difficulty arising from the inability of the arc to start itself, a method of working was devised in which the arc operated continuously, and emitted radiation continuously and the signalling was done by altering the frequency of the emitted waves.§ Numerous experiments looking to the adaptation of this plan to telephony were made, but it was found that by none of the arrangements tried could the scratching and hissing noises in the receiver be eliminated. While these experiments were being carried on, work on the development of a new high frequency dynamo was making good progress. In the only patent which has yet been granted on this machine‖ its general characteristics are described as follows:

It is necessary that it should give a pure sine wave, as such a form is the only one adapted to give perfect resonance. With a dynamo giving such a curve forming a part of a suitably constructed sending conductor, Professor Fessenden asserts that if the machine be wound to give a thousand volts on open circuit, it is possible by means of resonance effects to obtain a voltage of 100,000 volts on the sending conductor. These resonance effects are obtained by using a dynamo of low internal resistance as a portion of a sending conductor of large capacity or self-induction, or both, having these electrical constants suitably proportioned to give to the sending conductor,

that is, to the whole conductor from the top of the antenna to the ground, including the armature of the dynamo itself, a natural period identical with the periodicity of the dynamo. If the frequency of the dynamo were to be made lower than the periodicity of the radiating circuit the chief effects would be electrostatic and magnetic in their nature, and there would be practically no electromagnetic radiation. As it is only energy in the form of electromagnetic waves which may be transmitted to a great distance through the atmosphere, it is highly important that this effect should be predominant. The armature must have a low resistance, because if of a high resistance the oscillations will be dampened, making it impossible to produce high resonance voltages. Ventilation must be good, as the current may run up to a very high figure. The length of wire in the armature must be as small as possible, compared with the length of the sending conductor. If this relation were not maintained, the electrical constants of the entire sending conductor would be determined too largely by that part of the circuit between the armature terminals, and the amount of radiation would be much less than would be the case if the armature had a relatively small length of wire. Another way of stating this requirement is that the self-induction and capacity of the armature must be as small a fraction as possible of the self-induction and capacity of the entire sending conductor in order to secure the highest radiating efficiency. It is also essential that all iron magnetically influenced by currents in the conductor should be so proportioned and distributed as not to affect the shape of the curve of voltage, or to cause loss of power by hysteresis, as in such a case there would be too much dampening. For these reasons the dynamo may be constructed with a fixed armature containing no iron, having the air gap as long as possible, consistent with a high magnetic flux density, and revolving pole pieces so shaped as to produce sine waves as closely as possible. The revolving parts may be formed of magnetic material of high tensile strength, such as nickel steel. A peripheral speed of five miles per minute, which can be safely maintained with properly constructed moving parts of nickel steel, would allow the machine to be arranged to give one hundred thousand cycles per second. Such a speed can be obtained with a steam turbine to drive the dynamo.

The alternator which is at present in use is constructed along these lines, but embodies many ingenious mechanical arrangements due to the skill of several of the engineers of the General Electric Company, notably Dr. Steinmetz, Mr. Haskins, Mr. Alexanderson, Mr. Dempster and Mr. Geisenhoner.

This machine (Fig. 4) was originally designed for a frequency of 100,000 cycles, at an output of one kilowatt. It is now being driven by belting, pending the construction of a type to be driven by a De Laval steam turbine connected through gearing, and, on account of belt slipping, is never run at a speed to give more than 80,000 cycles. For most work it is run at 60,000 cycles, at which speed it has an output of about one-quarter of a kilowatt. The internal resistance of the armature is approximately six ohms, and the inductive drop at full load is about equal to the ohmic drop. At 60,000 cycles the voltage is about 60 volts. The armature makes 10,000 revolutions per minute, bearings being kept at a low temperature by lubrication controlled by oil pumps. The operation of the machine is said to be extremely satisfactory, it having been run daily for six or seven hours at a time with practically no attention. The design, and the method in which it has been worked out by the engineers and mechanics of the General Electric Company, mark a notable advance in dynamo-electric machinery, for which the highest credit is due to those who have developed this machine, accomplishing what has been declared by Fleming, in his latest published work in wireless telegraphy, to be an impossibility.

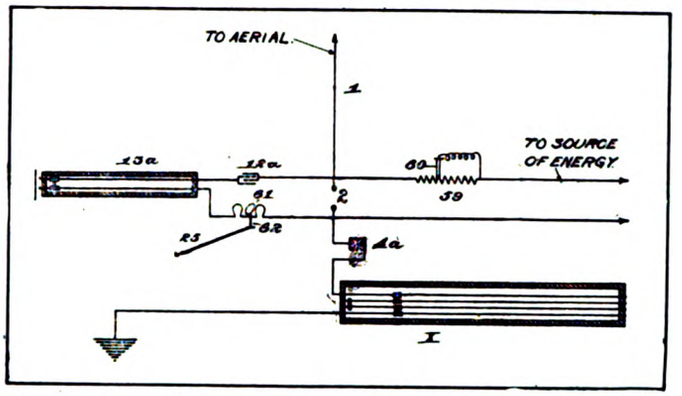

Fig. 3. Diagram of circuit used to regulate frequency of sparking in experiments with generation of waves by spark gap discharge.

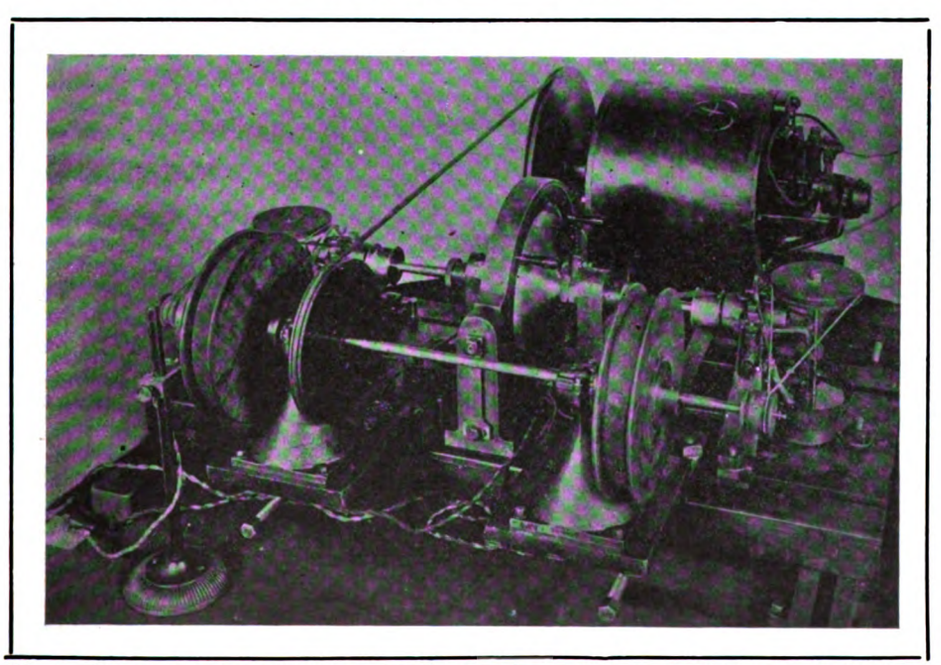

Fig. 4. Close-range view of alternator normally run at a speed to give from 50,000 to 60,000 cycles.

(To be continued.)

IOWA TELEPHONE MEN PLAN TO EDUCATE PEOPLE OF THE STATE BY STEREOPTICON LECTURES.

A PLAN for the education of the people of the State to a proper appreciation of the success of Independent telephone companies is being worked out by members of the Independent Telephone Association of Iowa. C. H. Smith, Chairman of the Program Committee for the Convention which is to be held at Sioux Falls during March, with George T. Hewes, Manager of the Independent Telephone Clearing House, and other prominent Independent telephone men of the State, are working vigorously to gather material for these lectures. For illustrations they are obtaining photographs of exchange buildings, and are requesting contributors of these views to give data covering the approximate number of employees, subscribers, etc. Manufacturers have also been invited to contribute photographs of their buildings, and interiors of their establishments, with a twenty-five word description for each view. Each manufacturer is requested to contribute views of what he considers the two most important features of his plant.

Digitized by Google

Cartoons are being gathered from all available sources, and from them and the photographs lantern slides will be prepared. From the data gathered a lecture is to be made up in time for its first delivery at the coming Convention, in order to show the magnitude of Independent development throughout the country. Subsequently the lecture will be repeated at District Association meetings and on appropriate occasions in various important places throughout the State.

The value of such a lecture at a time when a franchise is being considered, for instance, cannot be overestimated. The members of the association who are working on this matter are anxious to obtain material from the best sources, and contributions from telephone operating companies and manufacturers to this work will be decidedly helpful to the progress of Independent telephony in Iowa. The time is so limited before the first lecture that those who are willing to co-operate with the Iowa Association should take advantage of the opportunity at the earliest possible moment. Contributions may be sent to C. H. Smith, Chairman of the Program Committee, care Independent Clearing House, Des Moines, Ia.

Pending Legislation Affecting Telephone Companies

IN the legislatures of many states during the present term there have been presented measures affecting the interests of telephone companies. The substance of a number of bills dealing with regulation shows a marked similarity in the acts proposed in a number of states, as may be seen from an examination of the following summary of the most important now under consideration.

IDAHO LEGISLATURE TO MAKE FRANKING OF TELEPHONE MESSAGES ILLEGAL.

IN a bill recently introduced in the Legislature of the State of Idaho telephone companies are classed with railroad and telegraph companies by provisions which forbid them to give service without compensation. The bill not only prohibits the indiscriminate giving out of franks, but prohibits the interchange of passes and franks for the use of officers and employees of the companies mentioned in the act, so that it will be illegal for a telephone company to exchange franks for railroad passes. It is provided that jurisdiction for offenses committed under the provisions of the act shall extend to any county of the State where the fault is committed.

MISSOURI LEGISLATURE ATTEMPTS TO REGULATE TELEPHONE RATES.

A BILL recently introduced in the General Assembly of the State of Missouri provides that it shall be unlawful for any telephone company or any person or corporation controlling a telephone line which does business in that State to charge rates higher than $5 per month for business and $1 per month for residence service. The bill also provides that the limiting rate for long distance service between the hours of 6 A. M. and 6 P. M. shall be 20 cents for the first fifty miles or fraction thereof and an additional sum of 5 cents for each additional fifty miles or fraction thereof for each connection. It is provided that the night rate shall not exceed one-half the amount charged for day service.

SOUTH DAKOTA SENATE CONSIDERING MUNICIPAL OWNERSHIP TELEPHONE MEASURE.

IN the Senate of South Dakota a bill has been introduced by Mr. Jenkins which provides that the city council of any city in the State shall have power to acquire, construct, equip, maintain and operate a telephone system.

SOUTH DAKOTA SENATOR WISHES TO MAKE TELEPHONE COMPANIES COMMON CARRIERS.

SENATE Bill No. 8, introduced by Mr. Englesby in the Legislature of South Dakota, provides that all persons, partnerships or corporations carrying on a telephone business shall be common carriers, and as far as applicable the laws regulating the transportation of property by railroad companies shall apply with equal force to telephone companies. A further provision of the act is that the Railroad Commissioners of the State shall have general supervision over telephone companies, with power to inquire into complaints, unjust discriminations, neglect and violation of laws, etc.; and that these Commissioners shall have power to fix a scale of reasonable maximum rates. The bill further provides that the duty of the Board of Railroad Commissioners shall be to order all organizations engaged in the telephone business to make connections with all other concerns operating a telephone business in the same town, the apportionment of the expense of such connection to be regulated by the orders of the Commission. Penalty for a violation of the Act is fixed at a minimum fine of $1,000, or imprisonment for a minimum period of one year.

KANSAS LEGISLATURE CONSIDERS AN ACT RELATING TO TAXES OF MUTUAL COMPANIES.

HOUSE bill No. 120, introduced in the Legislature of the State of Kansas, provides that all property of Mutual Telephone Companies operating lines in the State shall be assessed by the township and city assessors when Mutual Telephone lines are found within the limits of their townships and cities. In determining the value of such property the assessors are directed to be guided by the value placed on other property in their respective townships or cities. The bill has been referred to the Committee on Assessments and Tax for consideration.

KANSAS FOLLOWS MISSOURI IN ATTEMPT TO FORCE INTERCONNECTION OF COMPETING TELEPHONE LINES.

SENATOR NOFTZGER has introduced in the Senate of the State of Kansas a bill by the terms of which telephone lines are declared to be common carriers, subject to the supervision of the State Board of Railroad Commissioners. In the second section of the bill it is provided that it shall be the duty of all telephone companies having central offices in the same city, town or village to connect them with every other central office in the same town, so that patrons of each telephone line may have, upon request, connection with all other telephone users.

AN ACT EMPOWERING THE STATE RAILWAY COMMISSION TO REGULATE TELEPHONE RATES AND SERVICE IN NEBRASKA.

IN Senate Bill No. 31, introduced in the present session of the Legislature of Nebraska, telephone and telegraph companies are included with railways in a provision imposing upon the Street Railway Commission the duty of regulating rates for service.

SOUTH DAKOTA TAKES UP COMPULSORY PROVISION OF TELEPHONE SERVICE AT RAILROAD STATIONS.

TO make it the duty of every railroad company having a ticket office, or freight office, in a city or town where there are one or more public telephone exchanges to constantly maintain in each office a telephone connection with all the exchanges is the object of Senate Bill No. 46, introduced in the Legislature of the State of South Dakota. It is provided that a railway company shall use the telephone installed in accordance with this act for the giving of prompt and accurate replies to all reasonable and proper inquiries concerning the passenger and freight service of the railroad received over such lines during

The Convention of the Wisconsin Association

MEMBERS of the Independent Telephone Association of Wisconsin came together for the discussion of matters of common interest, at Madison, on January 16 and 17. The meeting was called to order at 2:30 P. M. on January 16, and the delegates from the various Independent telephone companies in the State were welcomed by Mayor Schubert in a very pleasing speech, which was much appreciated. President Valentine's address was then delivered. He gave a statement of the conditions in Wisconsin, showing the progress made in the past year, and explained the object of President H. D. Critchfield, of the Milwaukee Independent Telephone Company and Wisconsin Independent Long Distance Telephone Company, in attending the meeting prepared to make detailed plans for co-operating with the various companies in building up a long distance toll system throughout the State. President Valentine also explained the litigation being carried on to enforce the discrimination rate bill passed by the last Legislature, and was followed by Attorney F. C. Grant, of Janesville, who was the attorney of record in the matter, on the legal status of the bill.

It will be recalled that the effect of this statute was intended to be to compel all telephone companies to charge a like rate in all cities of the same class. The cities of the State are divided into classes according to population and in those of any one class the rates must be the same. The Bell company of Wisconsin has disregarded this law and begun discriminations in Janesville which has resulted in an action in the courts brought in the name of the State. The Bell company has retained an able corps of lawyers and hopes to have the law declared unconstitutional by the courts. The tendency of the Bell company, as indicated by the evidence presented, is to charge lower rates in a city where an Independent company exists, in the hope of bankrupting the competing public service concern. Money has been raised by the members of the Association to aid the people to sustain their rights in the courts in a way which will assure to the members of the Association an opportunity to compete on fairer terms than are obtainable when their opponent can juggle rates to meet each local situation.

Richard Valentine.

Mr. J. B. Ware, secretary of the Michigan State Independent Telephone Association, spoke of the rapid growth which has been made by the Independent companies in Michigan, and told of the referendum elections in Canada, where a large majority of the municipalities voted to install long distance lines and exchanges under municipal ownership. Mr. Ware also explained the very successful operation of the Michigan Independent telephone clearinghouse, under the supervision of the Traffic Association.

At the evening session Mr. Critchfield arrived from Milwaukee, and presented the intentions of both the Milwaukee Independent Telephone Company and the Wisconsin Independent Long Distance Telephone Company for 1907, announcing that the long distance company was ready to take contracts at once for long distance connections with lines which would be immediately constructed. Members afterward listened to a much appreciated address on district organization by Mr. C. S. Norton, secretary of the State Association of Indiana. Before closing this first session, on motion, those present representing each Congressional District of the State were instructed to decide on their representative for each of the committees on the clearing house, district organization, nominations, and the committee on membership, and be prepared to hand in the names by 9 A. M. of the 17th.

On January 17, as soon as the meeting was called to order, a resolution was presented by Mr. Critchfield, and adopted, as follows:

Resolved, That this Association amend its constitution and by-laws so as to allow all individuals that are interested with the Independent telephone companies of the State of Wisconsin to become members of the Independent Telephone Association of Wisconsin when recommended by the executive committee.

Mr. Norton, of Indiana, very ably explained the formation and operation of the Indiana State Association, and Mr. Ware, of Michigan, also explained the formation of the State Association in Michigan.

At the opening of the afternoon session Mr. James B. Hoge, of Cleveland, president of the International Independent Telephone Association, addressed the convention until the departure of his train. He told of the growing use of the telephone and the rapid development of the Independent telephone companies throughout the country.

Following the address by President Hoge, Mr. J. C. Harper, of Madison, chairman of the committee on district organization, presented the following report:

1st. We invite and urge every Independent telephone company of the State to at once affiliate with this, The Independent Telephone Association of Wisconsin.

2d. We recommend the immediate organization by Congressional districts of all Independent companies.

3d. We recommend that within thirty days members in each district meet in convention, and effect a temporary organization with a view of making it permanent at the time of the adjourned meeting of the State Association; each district convention to adjourn its said convention and reconvene at the said State meeting.

4th. We recommend the securing at once of a State organizer to work under the State Association and assist the officers of the districts, in order that quick and effective district organization may be completed.

5th. We further recommend that the State Association raise and appropriate the sum of $2,000 to pay the expense, or such portion thereof as is necessary, to complete the organization of districts as outlined.

6th. We recommend that each district chairman call said convention at such time as the State Association officers may designate, that the organizer and other leaders may be present at all in order to secure uniform action as far as possible.

Remarks were then made by several members on the report, which was adopted. The committee on organization was then empowered to collect $2,000 in a manner aside from dues or assessments on the members.

The committee on nominations announced that its report would be made at the adjourned meeting of the Association and the committee was ordered continued.

The committee on the clearing house reported as follows:

"Your committee on a clearing house begs leave to submit the following: That, after considerable talk with Mr. Norton, of Indiana, we find that we favor the idea of a clearing house for the handling of long-distance or toll line business, the same to be of mutual origin, consisting of the different companies, but the form and conditions of such origin cannot be perfected without much work and forethought. There not being time for such work, we ask to have your committee on organization instructed to appoint a clearing house committee of three, and that the State organizer be one of that committee to take up the matter."

This report was adopted. The committee on membership reported a recommendation that the membership fee be reduced to $2 and the annual assessment be not more than one cent for each telephone operated by the company and one cent for each unit of toll line. The committee was ordered continued until the adjourned State meeting and that a committee of three be appointed on amendments to the constitution, to report at the

Digitized by Google

adjourned meeting. The chair appointed on this committee Messrs. Critchfield, Harper and Goodrich. After much discussion, the convention was adjourned to meet on March 7th, and 8th in the same hall if possible, at Madison, Wisconsin.

A hearty vote of thanks was tendered the Dane County Telephone Company for the use of Turner Hall, in which the convention was held. Voluntary subscriptions of several hundreds of dollars were collected in a short time and handed to the secretary for the purpose of defraying the expenses of the district organization, and the meeting was adjourned to meet on March 7th and 8th, 1907.

H. D. Critchfield.

Among those present were men from all over the state, including the following: W. F. Goodrich, La Crosse; J. G. Schweitzer, La Cross; E. J. Kneen, Bangor; George Byer, Westby; B. J. Anderson, Sun Prairie; J. C. Harper, Madison; O. O. Hougan, Stoughton; Andrew Lee, Westby; Dr. George M. Hiderschide Arcadia; H. R. Ritter, Madison; Charles Schernecker, Sun Prairie; Walter Drake, Black Earth; Clarence Jordalen, Kegonsa; B. Bartlett, Chippewa Falls; O. A. Spencer, Bloomer; H. B. Grieve, Kiel; A. A. Paulson, Kiel; E. I. Bates, Chippewa Falls; D. L. Bestor, Mazomanie; Jos. F. Fuist, Cross Plains; F. E. Mainwaring. Gotham; H. C. Winter, Madison; A. W. Larson, Amberg; H. Tesdale, Sparta; M. G. Williams; Sparta; C. M. Beebe, Sparta; George Barnum, Juda; H. L. Thompson, Madison; John M. Baer, Appleton; F. C. Grant, Janesville; Earl E. Miller, Iron River; A. N. Crosby, South Wayne; F. A. Cole, Orfordville; O. P. Gaarder, Orfordville; W. J. Bell, Deerfield; C. P. Goodrich, Fort Atkinson; H. H. Moehlengah. Clinton; John S. Donald, Mount Vernon; Frank G. Moore, Mount Vernon; F. J. Kimball, Briggsville; W. P. Hyland, Ashland; John O. Thomas, Franksville; E. H. Wells, Milton; Edward Cleary, Antigo; William Van Middlesworth, Racine; J. A. Murray, Baraboo; W. T. Sparks, Lodi; J. U. Schmidt, Prairie du Sac; C. F. Lamboley, Prairie du Sac; Fred M. Cole, Ashland; W. Tasher, Mount Vernon; E. C. Koch, Mount Vernon; F. W. Hoyt, Madison; A. C. Hoppmann, Madison; Mrs. H. C. Hackney, Delevan; Ole Fortney, Gay's Mills; W. R. Chipman, Morrisonville; L. A. Goebel, Mount Horeb; P. B. Knox. Madison; Matt Statz, Madison; John C. Niel, Waunakee.

From 125 to 150 telephone men, representing over sixty different companies were in attendance. Fifteen supply houses and manufacturers were represented.

The convention was followed by a banquet held at 8:30 P. M. at the Capital House, which was largely attended. Among the principal speakers were: J. B. Ware, of Grand Rapids; Francis C. Grant, Janesville; Mayor J. C. Schubert, Madison, and C. S. Norton, of Indianapolis, Ind. J. J. Nate, of Minneapolis, was toastmaster.

The result of this convention has been to make all companies represented look forward with increased enthusiasm to the time when they shall be as closely affiliated in their actual operating relations as they now are in plans for mutual helpfulness. This will come as an early and inevitable result of the building of the long distance lines discussed at this meeting.

Independent Executive Committee Plans for Association's Advancement

AT Cleveland, Ohio, on Jan. 7, 1907, C. W. Kline, Hazelton, Pa.; Frank L. Beam, Columbus, Ohio; M. B. Overly, Louisville, Ky.; Chas. S. Norton, Indianapolis, representing A. C. Lindemuth, Richmond, members of the Executive Committee of the International Ind. Tel. Ass'n, came together with President Jas. B. Hoge in the chair, and J. A. Harney, assistant secretary of the association, acting as secretary. The following gentlemen were also in attendance: Chas. E. Sumner, Portland, Ore.; J. G. Splane, Pittsburg, Pa.; W. B. Woodbury, Detroit, Mich.; Robert C. Hall, Pittsburg, Pa.; C. Y. McVey, Cleveland; Jas. S. Brailey, Jr., Toledo; E. W. Moore, Cleveland. The chairman read communications from other representatives of important operating companies who had been invited, regretting their inability to attend, and assuring the association of their support.

The secretary read a report on the present condition and needs of the association, which was discussed by the members present. After this discussion the following resolution was presented, and, upon motion duly seconded, was unanimously adopted:

Whereas, It is the sense of this committee that we undertake to raise $25,000 for the use of the International Independent Telephone Association in its general work of advancing the cause of Independent telephony; and,

Whereas, the work which the association has been doing, and contemplates continuing along broader lines with the money raised will help all of the interests in the field, and will be of particular benefit to the manufacturers of and dealers in Independent equipment and apparatus, including all kinds of supplies and accessories, by making a better market for such goods, and will also be of great assistance to engineering and construction firms by creating a greater demand for their services; therefore, be it

Resolved, that the president of this association be, and he hereby is, authorized and instructed to collect as promptly as possible all the unpaid assessments from State associations and to solicit from Independent manufacturers, supply dealers, engineering and construction firms, etc., as above mentioned, contributions to this fund of $25,000; and be it also

Resolved, that the president is authorized to use his own discretion as to the best method of securing these contributions and to select individuals or appoint committees as he deems it necessary to help in this work. Be it further.

Resolved, that State and other Independent associations, Independent companies, manufacturing and other firms above mentioned, and all in the field be urged to give the president, and those whom he may appoint to assist him, their hearty support in raising this fund.

It was moved and seconded that an informal meeting of the Officers and Executive Committee be held in Chicago, January 16th, at the Auditorium Hotel, and that State Presidents and Secretaries, with representatives of operating companies, including those present and all who might be in Chicago attending the Electrical Show, be invited to be present, the object of this meeting being to perfect arrangements for raising the fund of $25,000, and to consider other matters.

Other matters came up for discussion with a view to providing funds for development.

Suggestions looking to a broadening of the work of the association caused the committee to pass a resolution providing for honorary membership at an annual subscription of $25.00, to which all individuals interested in Independent telephony would be eligible upon approval of Executive Committee.

The resolution upon motion was unanimously adopted and all present subscribed for membership.

A resolution was also adopted, authorizing the president to publish an official bulletin for the purpose of keeping in closer touch with all of the interests in the field and to issue it not later than April 1st, and as often thereafter as desirable. This

Digitized by Google

bulletin is to be sent to all operating companies and others interested in the field, and is to contain the names of honorary members and contributors to the association, the details being left to the president.

After considering the names of all cities desirous of entertaining the 1907 convention, Chicago was selected as being the most desirable site, on account of its central location and especially on account of the present conditions there. The date selected, subject to approval, was the 4th, 5th and 6th of June. The president was authorized to make necessary arrangements for proper publicity, at this convention.

This gathering of so many prominent telephone men connected with Independent companies has been the occasion of widespread newspaper comment throughout the country, and various purposes have been attributed to the representatives. In newspaper reports which are authorized by the association, however, are statements from President Hoge saying that the meeting has no significance with regard to any merger of principal Independents, as has been widely reported, but is, as the Independent companies are generally well aware, for the purpose of taking steps to make the organization stronger for the mutual advantage of all its members. President Hoge also directed the attention of the newspaper men to the fact that since the last executive meeting was held in Chicago, important franchises have been granted to Independent people in various parts of the country, notably Omaha, Denver, Milwaukee and Boston, in spite of the determined fight against competition made by the Bell Company. The result of the election in Manitoba was also referred to as an important defeat for the Bell interests.

W. B. Woodbury, of Detroit, spoke of the plans of the Home Telephone Company, of which he is general manager, and said that as the result of the work of the past six months there are now four steel buildings in the course of construction; half of the local pole lines in Detroit are up; about one-third of the conduit system is completed and messenger and line wires are being strung at the present time on completed pole lines.

In addition to the local work, the company has built 300 miles of toll lines, carrying about 4,000 miles of circuit. The company will connect with all important Independent plants in Michigan, Indiana and Ohio. At present over 9,100 first-class contracts have been signed, and the company expects to begin operations during the latter part of this year with 15,000 subscribers. The property is fully financed, all money that is required being at the company's immediate disposal at the present time.

Senator Kline, who is vice-president of the Consolidated Telephone Companies of Pennsylvania, and is also interested in the Interstate Telephone & Telegraph Company, of Trenton, N. J., and other places, spoke of the steady development in Pennsylvania and in parts of New Jersey.

J. G. Splane, of Pittsburgh, told of the large demand for toll line service, which is heavily taxing the facilities of his company, although he now has traffic arrangements which give him connections with Ohio, Indiana, New York, West Virginia, Missouri and Kansas.

Charles E. Sumner gave enthusiastic reports of the development on the Pacific Coast, stating that the companies now organized and financed with Pacific Coast capital are building exchanges and long distance lines throughout Oregon and Washington, and will spend several million dollars before the end of the year. In Portland, Oregon, the exchange is almost completed, and the work is making good progress in Spokane, Walla Walla, Tacoma, Birmingham and other cities throughout the two States. Seattle, where the Independent plant already has 10,000 telephones in operation, is gaining rapidly.

Ed. L. Barber, vice-president and general manager of the Independent Telephone Company of Chicago, predicted that Independent companies of the country would have connections with Chicago subscribers within a few months. He said that all the capital needed for the development of an Independent system in Chicago is already at the company's disposal. Cleveland, with its important long distance lines, will be given connection with Chicago over the lines of the United States Telephone Company by way of Fort Wayne, and direct lines will run to Milwaukee, Omaha, Kansas City and St. Louis. Connections will be made via Pittsburgh and other eastern points over the lines of the United States Telephone Company. Long distance companies in cities surrounding Chicago are pushing their construction rapidly, in order that they may be able to make connections at the proper time. Mr. Barber called attention to the fact that with Independents occupying strong positions in Chicago, Milwaukee and Omaha, the Bell company would find itself unable to advance any claims of exclusive connections in the middle west.

F. L. Beam referred to the situation in Ohio, and said that the State association, of which he is president, has just finished tabulating reports from various counties which show a gain of over 21,000 telephones during the past six months, the total number being at present 269,220. Mr. Beam has found in the many parts of the state which he has visited in connection with his duties, that Independent companies are in a strong financial condition, and the majority of them paying satisfactory dividends on their stock. Much construction is being done, and toll line development, which has been very extensive during the past year, will be continued on an even larger scale. Extensive switching stations at Bucyrus, Ohio, are now being installed by the United States Telephone Company. This will give Independent exchanges in western and central Ohio facilities to more than double their present capacity for handling the rapidly increasing long distance business.

Mr. M. B. Overly, formerly general manager of the United States Telephone Company, and now holding a similar position with the Central Home Telephone Company, of Louisville, spoke of the work in the South. This company has taken over many Independent exchanges and long distance lines in southern Indiana, Kentucky, Mississippi and Tennessee. Among its other projects it is building heavy copper toll lines through to the Gulf of Mexico. The line is now completed as far as Birmingham, Ala., and rights of way have been secured for the rest of the distance. Mr. Overly is president of the Kentucky Independent Telephone Association, and states that every company in that state is in a prosperous condition, and prospects for all of them during the coming year are exceptionally good.

Charles S. Norton referred especially to the large amount of toll line business which has been carried on in Indiana during the past year. Figures obtained by him in a recent canvass of the state show that there are 187,488 telephones connected with Independent lines, and only about 62,219 connected with the Bell system, including sublicensees.

At the informal meeting of Independent telephone men, called by the Executive Committee of the International Association, the following gentlemen met in the Auditorium Hotel, Chicago, on January 16th: Jas. B. Hoge, Cleveland; Jas. S. Brailey, Jr., Toledo; A. L. Têtu, Indianapolis; W. C. Polk, Chicago; C. Y. McVey, Cleveland; C. E. Tarte, Grand Rapids; Frank H. Woods, Lincoln, Neb.; W. H. McDonough, New York; H. B. McMeal, Chicago; Chas. S. Norton, Indianapolis; W. B. Woodbury, Detroit; Max Koehler, St. Louis; W. J. Stadelman, Kearney, Neb.; J. P. Boylan, Cleveland; Hugo Koehler, St. Louis; J. A. Harney, Cleveland.

The meeting was called to order by President Jas. B. Hoge. Assistant Secretary J. A. Harney, acting as secretary. Communications from gentlemen who could not attend were read, and the chair then appointed the following committees to make the best arrangements possible for holding the annual convention in Chicago June 4th, 5th and 6th, or to see whether it would be advisable to change the place or time, with instructions to report promptly to him: H. B. McMeal, W. B. Woodbury and J. A. Harney.

The chair, in a brief discourse, pointed out the work being done by the association, its value to the Independent interests, and the importance of continuing it along broader lines. Concrete examples were given of the recognition of the Independent move-

COMPULSORY LOCAL INTERCONNECTION.

LEGISLATORS in a number of States are, during the present term, showing their appreciation of the importance to the public of a well developed telephone service by the introduction of measures the object of which is to compel the interconnection of competing exchanges located in the same town or city. The immediate result of the passage of such an act, should it be sustained in the courts, would be of course to enable any telephone user to obtain direct connection with any other subscriber for telephone service, irrespective of the ownership of the instruments and lines which form the medium of communication. Such a result, at first glance, and especially to a person not thoroughly familiar with the history and present state of telephone development, would seem to confer upon the people at large important benefits, which would warrant the most vigorous attempts to enact the proposed measures into laws. Like many other beautiful conceptions of a hasty imagination, however, it has numerous flaws which would be developed rapidly if once the plan were put in operation

So far there has been more or less talk of holding telephone companies to the same conditions as compel a railroad, as a common carrier under the law, to forward business received from another line. Passing over many of the arguments for and against the proposition along this line as more sentimental than practical, it can do no harm to base any consideration of the subject upon the immediately essential things, such as the effect a compulsory measure of this nature would have upon telephone operation and development, the two things which, aside from rates, form the only serious concern of the user of telephone service.

In the matter of operation there are difficulties which remind us of the arguments so widely distributed by certain press bureaus, harping on the evils of so-called telephone duplication. There would be the inevitable necessity for every telephone user desirous of utilizing the facilities afforded under the act to possess himself of a directory of both companies, even though he might use the instrument of but one. Confusion and delay would result in connection with many calls, and more particularly when these should happen to be of a special nature. Those involving reference to an information operator, pay station calls, the handling of requests for a line found to be busy, and many other forms of special service usually performed by telephone companies would be likely to be carried on with an impeded efficiency which would probably lead to a series of detailed annoyances tending to harass the telephone user to the point of continual dissatisfaction with his service. Those in favor of the measure contend that such things are mere matters of detail, the disadvantages of which could be overcome by an efficient management, if adequate pressure were brought to bear. Telephone men, however, have been for years trying to reduce the frequency of such operating troubles to a minimum, and the best of operating men are willing to admit that the conditions which have been obtained up to the present time are very far from ideal. Anything which will act in the way of a compulsory setback is looked upon with the utmost disfavor by them, and their opinion would soon be confirmed by the increased protests of their subscribers. This might be reckoned upon even with the heartiest cooperation of the employees of the interconnecting exchanges in carrying out the spirit of such a law as has been proposed. That such cooperation in business matters might be expected between the members of organizations which are engaged in so determined a competitive struggle as are the telephone companies is a little beyond the stretch of a reasonable man's imagination.

In relation to its influence upon development lies perhaps the most important disadvantage of the laws as planned. Wherever any one man, or any body of men, has made anything like a thorough and impartial investigation of telephone development in localities where competing systems have been in healthy existence for any considerable length of time, the conclusion has been drawn that the race for business on the part of the respective organizations has brought about an acceleration of the rate of progress. People have had their attention constantly drawn, by one device or another, to the value of the telephone service, and so in increasing numbers have made arrangements to secure its benefits for themselves. Yet, rapid as has been development under such conditions during the past two or three years, there are broad indications that it will continue with equal force for some time to come. A telephone system, up to a certain point, may be likened to a snowball rolling down hill. It gathers material over a constantly increasing surface, and gains in speed at an increasing rate for every advance, and the combined effect is to mightily increase its momentum.

That this momentum of telephone development is a good thing for a community has come to be admitted wherever it really exists. People are coming to look upon telephone service as a necessity to no less a degree than are the public light and water services. A few years ago these latter were thought by many to be luxuries. The telephone is passing through the same testing period as the other services, and will soon achieve the same standing. The value to the individual is increased with the completeness of the system. Inasmuch as the struggle for business under a state of competition is the chief factor in hastening development to that stage where we may have a really complete system of communication, with a terminal in every residence or place of business, it would appear to be contrary to the public interest, from the broadest point of view, to interpose any unnecessary check in the path of such free competition until the attainment of the highest state of development under its stimulating influence.

Rather deceptive are some of the published statements from officials of Bell companies in States where such a measure has been proposed. Although their strength lies in their toll lines, and their local development is inferior to that of their Independent opponents, they claim to oppose such an arrangement. Misled by such loud talk, and perhaps seeing an easy way to the use of toll lines which it would cost much money to build, many Independent companies favor such a measure. Before pledging their support it would be well for them to examine the condition of some of their neighboring companies who are sub-licensees, and see how great a proportion of profit goes with the control of the toll lines. Then, as even the State laws could not change such control, it would appear wise for the Independent telephone men to consider very carefully whether they are willing to see a law upon their statute books which will give to their opponent, equipped with long distance lines, all the advantages of connection with their well developed local exchanges. Should an Independent company think this a condition which it would be for its advantage to assume, there is no need of going through the roundabout device of bringing it about by statutory compulsion. It should not be hard for a company to enter into a sub-license contract when the Bell companies keep their best paid agents in the field for the purpose of bringing small organizations into this restful haven of inactivity.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

DUTY OF CONNECTING COMPANY TO ACCEPT MESSAGES.

I wish you would answer my questions in The Telephone In The Courts as soon as possible. We have a contract with the Home Telephone Company as follows, in part of which we are second party: All subscribers of the second party and all Mutual telephone companies transacting business over the lines of second party shall have the same toll line privileges as the subscribers of the Home Telephone Company.

We are a Mutual Telephone Company, but we have a contract to build our lines to the incorporation and they to meet us there from their switchboard, we to pay them at this rate: $.50 for one subscriber to the line, for two to four, $.30, five or more $.25 each. But they refuse to give the telephone companies coming to us any toll line services as you see they agreed to.

The contract is signed by their president and secretary, and by our trustees who are doing our business. We are incorporated without profit. The rest of their contract they make good. We have kept our share to the letter. We have use of over four thousand Mutual telephones, and so do their subscribers, as they have free use of our toll lines. But they will not give toll line privileges for our Mutual friends coming to us as they agreed. What can be done in this case? Are not toll lines and all telephone exchanges common carriers according to law in this State?

M. TEL. CO.

YOU are correct in supposing that toll lines and all telephones exchanges are common carriers according to the law of Ohio. If the company with which you have made the contract refuses to give toll line privileges to your subscribers or to your connecting lines, you may compel it to do so by mandamus or may recover damages from it for its failure to carry out its agreement. It is as much the duty of a connecting company to accept all messages tendered it as it is for the initial company to accept them. This duty is attempted to be enforced by statute in the State of New York, but the statute is merely declaratory of the common law duty owed by all companies so that the absence of a statute in Ohio makes no difference. The company's contract is in accordance with the common law, so that you are in a position to insist that the company carry out its engagement with you and your Mutual friends.

U. S. Tel. Co. vs. W. U. T. Tel. Co., 56 Barb (N. Y.) 46; Baldwin vs. U. S. Tel. Co. 6 A. B. B. Pr. N. S. (N. Y.) 406; Jones on Telegraph and Telephone Company, section 456.

LOS ANGELES RATE CASE.

A VERY important rate case in which the Home Telephone Company is complainant and the city of Los Angeles is defendant is pending in the Circuit Court of that city.

The principle involved is as to whether or not the city has a right under its charter to fix telephone rates by ordinance and whether the section of the city charter placing this power in the hands of the city council is valid. Under Section 31 of the city charter the council has fixed telephone rates. This section provides that each December the council shall demand of the telephone companies a statement of the business done for the year and that on this basis the rates for the ensuing year shall be fixed.

A suit to restrain the city from enforcing its demands was filed in the United States Circuit Court by the Home Telephone Company. The city filed a demurrer, claiming that the telephone company has not sufficient cause for action.

The telephone company contends that its franchise, when granted in 1902, provided the rates to be charged for the use of telephones and that this is in legal effect a contract between the city and the company; that the city council has no right or power to interfere with or prescribe different rates or any rates whatever other than those set forth in the contract.

As there has been no change in the amounts under the action of the city council the importance of the contention lies not so much at present in the financial advantage to the user as it does in the determination of the point whether the power to fix rates is within the jurisdiction of the city council.

Counsel for the city contends that under Section 31 of the city charter the council can fix rates and that this power cannot be abrogated or bartered away by franchise, contract or any other means; that this power is inherent with the council, existing before the granting of the franchise, and that the granting of this particular franchise in no way affects such powers. He also claims that the rates fixed in the franchise were simply maximum rates, placing on the telephone company a limitation as to the prices that could be charged, and that it did not bind the city under a contract to maintain the payment to the company of this maximum rate.

OMITTING NAME FROM DIRECTORY SAID TO HAVE CAUSED NOVEL DAMAGES.

A NOVEL suit has been instituted in Atlanta against the Southern Bell Telephone Company by M. C. Kiser and A. B. Green, known as the M. C. Kiser Brokerage Company. The plaintiffs ask damages to the extent of $1,000, alleging that their firm name was omitted in a new telephone directory issued by the Bell people, and that thereby the plaintiffs could not be notified by the Southern Railway Company that a car load of apples had arrived. They also allege that the apples were not received by the plaintiffs until the market was congested and profits on sales thereby greatly reduced or altogether destroyed.

GEORGIA OCCUPATION TAX UNCONSTITUTIONAL.

IT is declared that the State of Georgia will lose $30,000 and incidentally a sum that would have amounted to $150,000 by the affirming of a decision of Judge Pendleton of the Fulton Superior Court at Atlanta, granting an injunction against the State Comptroller General to prevent him from collecting from the Southern Bell Telephone Company certain taxes. The decision holds that the "occupation tax" of the State is unconstitutional. The Supreme Court has so decided in a test case brought by the comptroller general to compel the payment of this tax which is such a per centum on gross receipts as would equal 2½ per cent. on the gross receipts when added to the ad valorem taxes. The opinion says that the above rule is lacking in uniformity and is invalid. Owing to the adverse decision, Comptroller General Wright will recommend to the legislature the enactment of a new law on this subject which will avoid the constitutional inhibition.

COIN RECEIVING TELEPHONES TO BE TAXED IN MISSOURI.

A BILL calling for a $2 tax on all slot machines, telephones included, has been passed by the House of Delegates at St. Louis, Mo.

The Bell Telephone Company opposed the measure because, under its franchise, it pays 5 per cent. of the gross earnings of the company to the city, which amounts to $60,000 per annum, and it claimed the additional tax would be a burden.

Digitized by Google

INDEPENDENT EXECUTIVE COMMITTEE PLANS FOR ASSOCIATION'S ADVANCEMENT.

(*Continued from page 55.*)

ment among the press of the country and the value of proper publicity. The special work being done by the association along this line was described, including the preparation of a comprehensive write-up of the Independent system for the Boston *Commercial*. A general discussion followed, and all present declared themselves in sympathy with the association's work and aims and in favor of the plans proposed for securing financial assistance required.

It was unanimously voted that the association create a membership for the Independent manufacturers, jobbers and supply dealers, concerns securing such membership to pay to the association, as annual dues, one-twentieth of one per cent of the gross amount of their business transacted during the preceding year with the Independent telephone people. All details, including issuing membership cards, etc., were left to the executive officers of the association.

Mr. H. B. McMeal, president of the Telephony Publishing Company, and Mr. W. H. McDonough, president of THE AMERICAN TELEPHONE JOURNAL, on behalf of their respective companies asked to have them included in such membership, saying they would be glad to assist in the association's work by contributing the annual dues on the basis proposed.

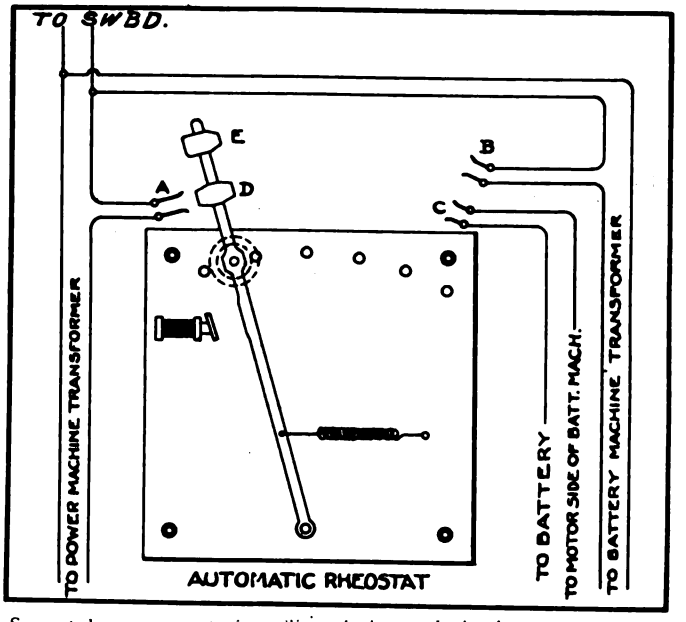
Mr. McMeal, secretary of the Manufacturers' Association, on behalf of that organization, extended an invitation to representatives of the International Association to be present at the Manufacturers' meeting to be held in Chicago, January 22, 1907. Selection of this committee was left to the chairman.

A REGULATING DEVICE FOR RINGING CIRCUITS IN TELEPHONE EXCHANGES.

By F. C. GREENWALD.

IT may happen, owing to some trouble at an electric light plant or other point, that the pressure on the mains which supply power to a ringing motor at the telephone exchange may be temporarily lowered or cut out entirely. This invariably allows the starting box lever of the motor to drop back to the starting position. The machine naturally comes to rest and does not start when the current again appears on the mains, thereby cutting off the ringing power from the switchboard until the wire chief can restart the machine. At night this may cause considerable delay in the service, as it may be difficult or impossible to notify the wire chief of the disabled condition of the plant.

A scheme was lately seen in use which was calculated to offset the annoyance which might be caused in this manner by the failure of the electric light circuit. Upon the starting lever on the rear of the rheostat were affixed two blocks of copper insulated from the lever and from each other. These blocks, when the lever was in starting position, connected two sets of springs,



Suggested arrangement of auxiliary devices and circuits on motor starting box.

thereby closing the circuit of the machine run by storage battery current. One of the copper blocks, when electric light current held the lever against the magnet of the starting box, closed the alternating current lead from the power machine to the switchboard; consequently when the lever left the magnet this latter circuit was opened, thus making it impossible for a winding of the power machine transformer to be across the leads to the switchboard while the battery machine transformer or pole changer might be supplying current.

Telephone Exhibits at the Chicago Electrical Show

THE large number and varied character of the exhibits of supplies and apparatus used by telephone companies were most striking features of this year's Electrical Show at Chicago, which has just closed. The exhibits were of a size, and displayed with an attractiveness, which showed that the individual firms are fully prepared to do their part in the development of what has become one of the most important of the electrical industries. Those who attended the show a year ago were in many cases surprised at the progress which has been made in the designs and manufacture of material and apparatus.

Prominent among the exhibits were those of many firms well known to buyers of telephone supplies. A summary of the leading exhibits may be given as follows:

THE PEIRCE SPECIALTY CO., Chicago, Ill., had an interesting and representative exhibit, the frame work of their booth being composed of channel and angle iron of the various sizes used in the manufacture of their different specialties. On these steel side pieces were mounted the well known 2-point Peirce brackets In the center of the exhibit was a 15 foot pole on which was mounted a 48 pr. Peirce distributing ring, from the points of which were wires leading to the brackets around the side walls, each pair of wires bearing a number of electric lights. To demonstrate the economy and efficiency of the Peirce Hammer Drill, a stone block weighing a half ton was provided, into which holes were drilled by the salesmen. It required not more than a minute to drill a hole and set the bolt. The company was represented by C. L. Peirce, Jr., A. L. Haase, A. J. Kusel, R. L. Crane and H. Ward. The Clay Product Company's vitrified Fire Clay Conduit was also exhibited, and attracted much favorable attention. This company was represented by H. H. Titsworth, H. M. Lignard, and Messrs. Kusel and Haase.

THE NATIONAL BATTERY CO., Buffalo, N. Y., showed a line of batteries and Unit Accumulators.

THE MCROY CLAY WORKS, of Brazil, Indiana, displayed its well-known clay conduits.

THE AMERICAN SEWER PIPE COMPANY was represented by W. R. Adams, sales manager, and W. H. Rook, master mechanic. The company showed a line of vitrified clay conduits of different sizes.

THE AMERICAN CLOCK COMPANY had an attractive exhibit in charge of the officers of the company, H. O. Jackson, president; Ed. Eves, general manager; G. F. Randall, secretary and treasurer; H. W. Pigeon, general superintendent, and E. E. Flors, mechanical engineer. The company showed for the first time its electric clocks synchronized over telephone wires, which have just been placed on the market. These clocks are automatically synchronized every 24 hours by an electric self-winding clock at the central telephone station. An electric time recording system was also shown.

MATTHIAS KLEIN & SONS, Chicago, Ill., had an exhibit of line-

Digitized by Google

men's tools, and in the same booth The Bigley Telephone Company showed a line of reconstructed telephone equipment. John M. Klein and Alfred Onquest represented the respective companies.

THE HOLTZER-CABOT ELECTRIC COMPANY, Brookline, Mass., and the Oliver Manufacturing Company, of Philadelphia, occupied a space together. The latter showed the "Flexiphone," a new type holder and adjustable arm, and the former the Equipoise holder, a line of motors and generators, telephone supplies, etc., and the "Flexilight." E. R. Harding and W. B. Oliver were in charge.

THE GOULD STORAGE BATTERY COMPANY, New York and Chicago, showed a full line of batteries, lead-lined tanks and glass jars for telephone and telegraph central station purposes, also couple types for private branch exchange and central office uses. H. N. Powers, R. H. Watson, E. M. Hervey and John E. Eipper represented the company and reported that the Gould batteries are being used more than ever.

FRANK B. COOK, of Chicago, had an exhibit, at which Mr. Cook was present much of the time, assisted by F. W. Pardee, John F. Tompkins, F. R. Parker, R. C. Cook and the following road men: E. M. Snow, F. A. Rader, S. E. Harvey and J. M. Moore. A demonstration was given of Cook's self-welding wire joint. Among the specialties featured was the Type L distributing frame, combining distributing frame and protector, and Cook's new No. 10 resoldering coil, also a full line of pole terminals, twenty different sizes and varieties, and individual fuse mount protection.

THE STROMBERG-CARLSON exhibit was made especially attractive with an illuminated map, showing the location of some of the company's exchanges. The map was lighted electrically with larger opals to represent the central energy multiple exchanges. There was shown a section of a switchboard, which is to be a part of an exchange for the Twin City Telephone Company, of Minneapolis, having a capacity of 10,000 lines. The company was represented by J. P. Cracraft, sales manager, of Rochester, N. Y.; A. M. Haubrich, manager of the Chicago branch; William Bowen, of Iowa; Paul D. Myers, of Illinois; Sam W. Menefee, of Minnesota and Wisconsin; J. J. Nate, of Minneapolis, and E. P. Shafer, of Indiana.

THE ELECTRIC APPLIANCE COMPANY, of Chicago, was represented by P. R. Boole and F. J. Alderson. Its Packard lamps formed a very pretty display. Among the exhibits featured were Paranite rubber-covered wire, O. K. weather-proof wire and "Eaco" telephone specialties.

THE SWEDISH AMERICAN TELEPHONE COMPANY, of Chicago, was represented by M. S. Golladay, of Missouri. The company had a complete display of magneto exchange equipment. A special feature of the exhibit was a new removable drop coil, which can be taken out and put back without tools and without removing the drop.

THE VOTE-BERGER COMPANY, of LaCrosse, Wis., showed a common battery ballast switchboard without a relay, which does away with the risk of trouble from burning out; also, a 300-line magneto switchboard, magneto telephones, common battery telephones, D. and T. anchors, etc. The company was represented by W. A. Grimes, M. I. Berger, C. D. Enochs, P. W. Goodman and A. R. Callahan.

THE EUREKA ELECTRIC COMPANY, of Genoa, Ill., featured its central energy board, visual signal type, and a new magneto drop, which can be removed from the back of the board, all kinds of telephone equipment, etc. J. H. Bell, V. H. Messenger and G. H. Miller were in charge.

THE VULCAN ELECTRIC HEATING COMPANY, of Chicago, showed a fine line of soldering and branding tools, electrically heated. Among these was a long, slim, soldering iron for use in a multiple switchboard, very effective yet without enough heat radiation to damage the insulation of wires. Among the branding tools was one designed especially for putting the name of the contractor on the wooden handles of tools. The company was represented by F. J. Holmes, L. P. Brown, G. M. Cox, J. W. Fay and Herman Haines.

THE SANDWICH POLE CHANGER COMPANY had an exhibit in charge of G. H. Lenerett, E. C. Hennis and H. O. Rugh. They showed a line of pole changers adapted to straight ringing and selective ringing by alternating or pulsating current.

W. N. MATTHEWS & BROTHER, of St. Louis, had a most unique and effective display of the Sombaugh guy anchor. The display had all the effect of an actual out-door demonstration. One of the guy anchors had been bored into the soil five feet and then taken to Chicago, dirt and all. The anchor was shown embedded in the soil throughout its whole length. This anchor was of the 6-inch variety, which is guaranteed to hold 15,000 pounds. There was also an interesting display of the Hargis cable splicing joint, showing the different steps in making the joint; the Lima jack box for telephone service; the Callahan cable roller, which requires no wrenches; the Hold-Fast lamp guard for telephone exchanges, etc. The company was represented by W. N. Matthews, Claude Matthews, J. R. Kearney and V. T. Crawford.

THE NUNGESSER ELECTRIC BATTERY COMPANY, of Cleveland, showed a complete line of dry batteries.

THE HEPBURN TELEPHONE COMPANY, Chicago, showed an intercommunicating telephone, which was a decided departure from the ordinary arrangement. The 24-station switch is about the shape and size of the transmitter. It has a revolving dial, the numbers of which indicate the several stations of the system. By means of this device it is possible for all the pairs on the system to talk at the same time without interfering with one another. The company was represented by Walter L. Davis, its president; O. N. Davis, general salesman, and Wm. A. Rowley, electrician.

JOHN SHAFER, representing the Antiseptic Company, showed a line of the Red Cross antiseptic mouth-pieces for telephones. They are of aluminum and it is claimed that they kill all germs which may accumulate without injuring transmitting qualities.

The splendid exhibit of the DEAN ELECTRIC COMPANY, of Elyria, Ohio, attracted general interest. It is doubtful if a finer case of line and switchboard parts was ever shown than the one conspicuously placed in this exhibit. The company featured its Harmonic Ringing Machine, which will ring 300 bells at one time. The exhibit contained, among other equipment, a standard 3,000 to 8,000 ultimate, full common battery multiple board, as well as private branch exchange boards and a magneto switchboard arranged for harmonic party line service. Of course, a full line of telephones and parts was shown. The company was well represented by salesmen and officers. Those present were George A. Scoville, sales engineer; A. E. Barker, second vice-president; W. W. Dean, first vice-president and chief engineer; A. B. Smith, Michigan; L. M. Ford, Illinois; Fred Coulson, Nebraska; L. G. Bowman, western representative at Kansas City, and A. A. Hathaway, of the engineering department.

J. ALLEN HAINES, of Chicago, showed a large line of electrical supplies in charge of Mr. Haines himself, assisted by Dwight Welling, engineer.

THE WIRE AND TELEPHONE COMPANY OF AMERICA, Rome, N. Y., occupied the same space and made a great hit with its "Easophone." It also exhibited the well-known "Romeoid" wires, of which a full line was shown. The exhibit was in charge of H A. Hammond, sales manager, and F. M. Potter, vice-president.

THE CENTRAL ELECTRIC COMPANY, of Chicago, showed an interesting line of electrical supplies and novelties. The Reco sign flasher made the exhibit very conspicuous. Much attention was attracted by a very large "biscuit" of okonite rubber for insulating worth in the neighborhood of $240, and a section of submarine cable, badly tangled and twisted by a tug-boat in New York harbor. It put the boat out of business, but the cable was still doing duty when removed for repairs. The exhibit contained a line of Columbia telephone lamps, Okonite rubber insulated wire and cable, Edison LaLande primary batteries, D. and W. telephone protection sets, etc. The company was represented by F. R. Bryant, general sales manager; H. E. Erickson, advertising manager; R. L. Kimble and W. H. Pearl.

THE MONARCH ELECTRIC AND WIRE COMPANY, of Chicago, was represented by E. W. Kearns, A. D. Gillespie, H. E. Mason, E J.

Digitized by Google

Cassem. Louis Schwab, president, and Henry Schwab, secretary, also spent a great deal of time at the exhibit. The company showed a line of the Nurnberg flaming arc lamps, Bryan-Marsh incandescent lamps, the Long Distance Telephone Manufacturing Company's telephone and equipment, Noark and Paiste material, and Marquette incandescent arc lamps.

THE AUTOMATIC ELECTRIC COMPANY showed the latest thing in automatic telephone systems, being two units of a 100,000 line installation, full central energy, 4-party selective. Two complete exchanges were shown in operation. Those in charge were Mr. H. H. Woodworth, advertising manager; J. S. Engh, J. A. Russell, J. E. Fisher, C. L. Fisher and P. J. Eubanks.

THE AMERICAN ELECTRICAL NOVELTY AND MANUFACTURING COMPANY made a feature of the Ever-Ready battery, a high voltage and ampereage cell combining long life with high efficiency. This battery has been before the telephone people about a year and a half and has been very successful. Sample lamps were also shown from the American Miniature and Decorative Lamp Company, Ever-Ready flashlight material and the Ever-Ready keyless clock, controlled by three batteries, which will run one year without winding. E. G. Weed was in charge, assisted by R. E. Bain and E. R. Behrend.

THE CENTRAL ELECTRIC MANUFACTURING COMPANY, of Rock Island, showed the Blackhawk batteries, the Frank W. Morse specialties, the E. W. Dolliver lamp coloring, and the Talmont Electrical Engineering Company's decorative lamps. All the goods in the exhibit were American made. The exhibit was in charge of H. J. Alvin, general manager; E. W. Dolliver and George W. Edge, of the Connecticut Electrical Manufacturing Company.

ROTH BROTHERS & COMPANY, of Chicago, represented by William Roth, showed a Twin Set Motor running a laundry machine, printing press, grinders, blowers, lamps, etc.

A very unique and interesting exhibit was that of the ARMOUR INSTITUTE OF TECHNOLOGY, of Chicago. This famous school showed a fine line of apparatus in use at the school, including a high tension voltmeter, which will measure up to 100,000 volts, and an oscillograph for indicating the wave forms of voice currents. There were also samples of mechanical drawings by the students and reports of laboratory experiments made by students. A rotating magnetic field, illustrating the principle in the induction type of alternating motor, attracted much attention. The school was represented by Ernest H. Freeman, D. A. Morton, C. D. Bowman, John E. Snow and F. H. Bernhard.

THE ELECTRIC STORAGE BATTERY COMPANY, of Philadelphia, showed a line of car lighting batteries and large cells, such as are used by the New York Central Railway and various telephone and telegraph companies. The company was represented by G. H. Atkin, J. M. S. Waring, H. S. Mushrall, W. F. Bauer, W. F. Rath and George Neth.

A wire wound column twenty feet high and surmounted by forked lightning in bronze marked the location of the exhibit of the AMERICAN STEEL AND WIRE COMPANY. Among the exhibits were a line of rail bonds, rail bonding tools and electrical wire and cables of all descriptions, fence rope wire and a full line of springs. The company was represented by C. R. Sturdevant, of the Worcester office, and B. B. Ayres, C. S. Knight and George Long, of Chicago.

PENDING LEGISLATION AFFECTING TELEPHONE COMPANIES.

(*Continued from page 52.*)

business hours. The enforcement of the act, should it become a law, is left in the hands of the State Railroad Commission.

NEBRASKA TO CONSIDER THE EXTENSION OF TELEPHONE FRANCHISE POWER.

CITIES of the second class, having less than 5,000 inhabitants, and villages, will be empowered to grant franchises for telephone systems for a period not to exceed twenty years, if Senate Bill No. 89 now pending in the Legislature of Nebraska should pass. The act provides that the Mayor and Council, or Board of Trustees, as the case may be, shall have power to grant franchises to any person, corporation or association, for the period mentioned, and shall have power to regulate the laying down of conduits and erection of poles, and also to regulate the sale and fix the price of telephone service.

MEASURE INTRODUCED IN ASSEMBLY OF THE STATE OF SOUTH DAKOTA PROVIDES FOR REDUCTION OF TELEPHONE RATES.

THIS drastic bill is intended to causes all such companies to reduce their rates for all business originating and terminating in the State of South Dakota twenty-five per cent. below rates in force on January 1, 1907.

A BILL TO COMPEL INTERCONNECTION OF EXCHANGES IN NEBRASKA.

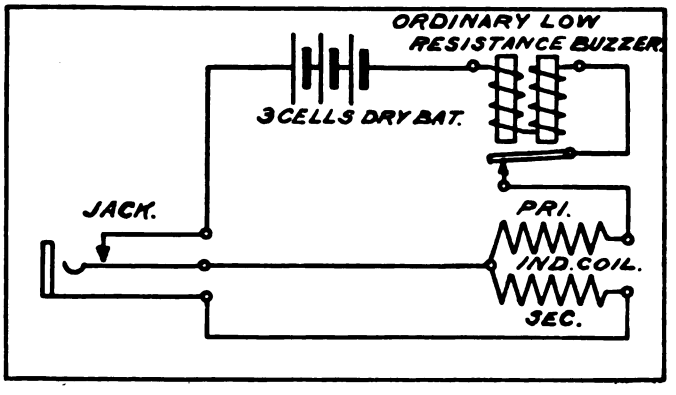
INTRODUCED by J. W. Whitham on January 8th, and returned to the Committee on Telegraph and Telephones of the House of Representatives of Nebraska, was a bill providing that it shall be the duty of any incorporated telephone company doing business in the State of Nebraska to connect its lines with the lines of any other incorporated telephone company doing business in the same city or village, where the first company has now or may establish a public telephone station. In this bill it is provided that this connection shall be made binding thirty days from notice.

PROHIBITION OF FRANKING OF TELEPHONE MESSAGES IN SOUTH DAKOTA.

UNDER Senate Bill No. 6 of the State of South Dakota, introduced by Mr. Byrne, telephone companies are included with railroad companies in a clause of the bill which prohibits the giving of a free ticket or frank to enable a person to transmit messages without offering remuneration in the regular form.

ANOTHER HOWLER CIRCUIT.

NOTING our recently published description of a Howler Circuit, Mr. B. D. Hursh, manager of the Stroudsburg & Bushkill Telephone Company, Stroudsburg, Pa., has sent us in the diagram which appears in the accompanying illustration. While this employs practically the same arrangement of battery, buzzer and induction coil which was described in a previous issue, its novelty consists in a very simple plan for applying a howler to a line on which a telephone has been left off the hook.



Simple Howler circuit for use with regular cords in a magneto exchange.

The idea is simply to connect the circuit to a jack which is adapted to close the battery circuit when a plug is inserted, in a manner which will be plainly evident from an examination of the diagram. The operator inserts one plug in the line to which the howler is to be connected, and inserts the mate in the howler jack cutting out her listening set, so that she may not get the howler noises in her ear. An especially convenient arrangement for mounting is said to consist of a jack arranged similar to an ordinary operator's receiver jack, but adapted to fit a regular switchboard plug. In the exchange where this plan is now in operation there is an exceptionally well equipped shop, and a special jack was made for this purpose.

IN THE OPERATING FIELD

INDEPENDENT TELEPHONE DEVELOPMENT IN THE SOUTHWEST.

By Chas. F. Speed.

THOSE who have read in the papers that there are counties in Texas which are owned by one man may wonder where there is any chance for the telephone man to find subscribers. This may be quickly off-set by the statement that nearly every exchange has a large waiting list. In the writer's home town of Texarkana the Independent company has a subscription list which outnumbers that of the Bell company two to one, and has had for the past two years a very large waiting list all the time, although it has kept a construction force at work. Other cities are behind their orders in the same manner.

The reason for this is due largely to the rapid growth of the country, caused by the immense ranches being cut into farms. The Southwest has been continually calling for settlers, who have responded in great crowds; thus they are slowly filling up the vast country, building new towns, and increasing the population of the older ones, and putting on the telephone man a demand for service, which he has been unable to meet. There is no question but what this is a healthy condition, however, for it results in the exchange manager being able to select his subscribers according to their financial standing.

The first Independent telephone exchange in the Southwest was operated by the Pan Telephone Company, of Fort Smith, Ark., which began operation in the earliest days after the expiration of the Bell patents, and is still operating and holding its own very well. Little Rock, Ark., started about the same time, and for years applied earnings to the building up of the system. The stockholders, however, wanted dividends, so that development could not continue on this plan.

Although there are believed to be between thirty-five and forty thousand Independent telephones in Arkansas; there are only about forty miles of Independent long distance lines in the State. This defect is likely to be met this year by the Telegraphone Company, which is now at work building lines out of Little Rock, and expects to connect Little Rock with Pine Bluff, Memphis, Texarkana, Fort Smith and St. Louis.

In Louisiant the early Independent movement took a strong hold, and nearly all the towns and cities were built Of these plants the Cumberland Telephone and Telegraph Company bought up all but a few, the principal ones left being Shreveport, with 1,400 subscribers, and Monroe, with 500. Genuine Independent development of this State, however, is to be undertaken, and the end of this year will see the situation somewhat changed.

Texas, in the early days, proved an inviting field for the promoter, because with the high rates for service, he could show an excellent prospectus, even though he had excessive bond and stock issues. It is enough to say that the promoter withdrew from Texas some three or four years ago, when he found the Texas people would not buy five and six per cent bonds. Why should they when money brings eight per cent on the best of security, and not infrequently very much higher rates? The telephone man who comes to the Southwest with the intention of remaining, and becoming one of the people, can find many excellent opportunities for investment, and can secure local capital to assist in the work, but he will be expected to show his faith in his work by holding the greater part of the stock, and remaining as a citizen.

Towns having less than 300 subscribers pay rates of $1.50 per month for residence telephones and $2.50 for business telephones, the larger exchanges getting $2.00 for residence telephones and $3.00 for business telephones. The toll line business in the Southwest is more profitable than in any other section of the country, because of the cotton business. Rates for service, except the minimum, which is higher, are about the same as in other parts of the country, but the volume of business is greater. All well-built toll lines are doing double duty, being used by cotton brokers for telegraph purposes and by the exchanges for toll service. It is not at all unusual for a cotton broker's monthly bill during the cotton season to run from three to six hundred dollars. In the Southwest exchanges provided with good toll line connections frequently do an average from six to eight dollars' worth of toll business per subscriber per month.

WHAT DO YOU WANT TO KNOW?

THE Editor of The American Telephone Journal *frequently receives letters from subscribers asking where printed information about one class of telephone work or another can be found. Frequently he has to refer the inquirer to something that does not exactly fit his needs, because the needs are not clearly stated or because there is nothing published which covers the case.*

The Query Department *is maintained especially for the benefit of practical telephone men, who wish to have reliable answers to practical questions. Whoever sends in a query, no matter on what subject, may be sure of receiving the opinion of an expert.*

The Editor wishes to have each subscriber realize that an answer to any question relating to telephone work will be furnished to him promptly, and without cost. All that is necessary is that he shall, in addition to asking his questions, state clearly all facts necessary to give a complete understanding of his local conditions, in order that the answer may be made reliable.

Address all queries to The Editor, American Telephone Journal, 100 *William Street, New York City.*

NEW MEANS OF APPROACH TO ORIENTAL ROYALTY.

IN the public square of Teheran, the capital of Persia, according to a London newspaper, there has been set up a telephone booth, from which the people may converse directly with the Shah. This is said to have been set up in order that those with grievances might have an opportunity of communicating their complaints to him. This privilege has hitherto been denied them, even the near approach to his person being prevented by the vigilance of his guards.

Newspaper men, even in London, are beginning to realize that the telephone can be made the basis of some very interesting stories.

ARKANSAS INDEPENDENT TELEPHONE MEN WILL MEET AT LITTLE ROCK.

THE annual meeting of the Arkansas Independent Telephone Association has been called for February 18 and 19, at the new Hotel Marion, in Little Rock. This is the second meeting of the association, and it is expected that nearly every prominent Independent telephone man in the State will be present. The question of further developments in the general interest of the Independent movement, and greater efforts in toll line construction will be the main subjects for discussion. The International Association has agreed to send a delegate to the convention to represent that body.

IN THE OPERATING FIELD

CONSOLIDATED COMPANIES OF PENNSYLVANIA HOLD WELL ATTENDED MEETING.

At the annual meeting of the Consolidated Telephone Companies of Pennsylvania, held last week, it is said that stockholders representing more than three million dollars worth of holdings were represented. This company is now operating thirty-eight exchanges, with a total of 16,944 telephones, as indicated by the annual report of Superintendent Charles West. The increase in the number of subscribers has been very satisfactory, a gain of 2.6 per cent during the past year being recorded. General Superintendent West referred to the policy of extensions, which, since its original introduction by him, has led to extensive development in the coal, slate, cement and silk regions, and this will be continued, with the additional development of long distance lines as rapidly as possible during the coming year.

A board of directors for the coming year was elected as follows: George O. Albright, R. E. Wright, Allentown; A. J. Brumbach, Reading; Thomas Daugherty, Allentown; Frank M. Green, Washington, D. C.; Wilson J. Hartzell, Allentown; J. P. Helfenstein, Shamokin; A. P. Trautwein, Carbondale; George N. Reichard, Wilkes-Barre; John R. Hendel, Reading; George R. Bedford, Wilkes-Barre; W. A. Lathrop, Philadelphia; C. D. Simpson, Scranton; I. A. Stearns, Wilkes-Barre; C. W. Kline, Hazleton.

The board organized by electing these officers: President, Robert E Wright; vice-president C. W. Kline; secretary and treasurer, C. M. W. Keck, Allentown; general superintendent and assistant secretary, Charles West, Allentown.

CUMBERLAND COMPANY HAS MANY TROUBLES BEFORE THE MISSISSIPPI RAILROAD COMMISSION.

Complaints against the Cumberland Telephone and Telegraph Company (Bell) from a number of towns in Mississippi are being taken up by the Railroad Commission, which is now in session at Jackson. The principal difficulties are in the matter of rates, as the company is alleged to have violated the provision of the statute in regard to inter-county messages. Complaints to the commission have been received from Hattiesburg and Meridian, where boycotts have been declared against the company. In Vicksburg the opposition to the company while less formal, is none the less emphatic. Citizens are vigorously going to work to organize an Independent company to give the service which they cannot obtain from the concern now operating. Biloxi has a complaint pending, alleging that the service furnished is inadequate and generally unsatisfactory. These movements from different places in Mississippi are the result of a dissatisfaction which seems to exist throughout the territory.

Complaints from many other places, alleging that the Cumberland Company has not complied with the order relative to inter-county service, have been received, and they are being vigorously pushed. It is believed by those who are familiar with the situation, and the previous acts of the company, that at the last moment it will seek to come to some sort of a settlement which will avoid the possibility of its being subjected to a stringent order, and subsequent close supervision by the commission.

NORTHWESTERN TELEPHONE EXCHANGE COMPANY ATTEMPTS TO HOLD FRANCHISE BY BUILDING.

Soon after the expiration of the franchise of the Northwestern Telephone Exchange Company (Bell), at Yankton, S. D., the company announced that it was about to undertake the rebuilding of its system. The city council was unwilling that the company should operate without a franchise, and, as it assumed that the organization was absolutely without legal rights in the city, it ordered the marshal to instruct the local management of the company that no work upon improvements should be undertaken. This formal order was issued by the council in the belief that refraining from interfering at this time would be tantamount to extending the charter of the company. The proceedings are of great interest to the Independent company at Yankton, and its associates in other Dakota towns, who are carefully watching developments in this interesting situation.

GERMANS SAID TO HAVE TAKEN UP FERRET IDEA FOR RUNNING CABLES.

A construction superintendent in Indiana, to whom the newspapers attribute the recent revival of the plan of using ferrets in the operations preliminary to the drawing in of telephone cables, may be responsible for the waking up of German telephone men to the advantages of an animated substitute for the duct rod. A German newspaper is authority for the statement that in Munich the scheme has recently been put in operation.

In Munich it is understood that rats, liberated ahead of the ferrets, supply the incentive to effort, while the reports issued in this country say that a piece of meat at the distant end of the duct is sufficient attraction. If the Americans have not by chance found a livelier breed of ferret, the Germans must have made a step in advance, possibly owing to improved methods of catching bait.

BOSTON TELEPHONE SUBSCRIBERS INQUIRING INTO BELL RATES.

Precipitated by the publicity given to telephone affairs at the time of giving a franchise to an Independent company, an inquiry into the rates of the Bell company is being pushed before the Massachusetts legislature. Its object is said to be particularly to secure reductions and greater uniformity in rates between Boston and various suburban points, with which telephone users are reported to be at present very far from satisfied.

QUERIES

KICK COIL TELEPHONES.—(817.)

The following abstract from a letter recently received from the manager of an Indiana company seems to be an interesting contribution to the discussion of "kick coil" telephones which was recently precipitated by the inquiry of a subscriber.

"The arguments put up by the engineer who wrote the material published in your issue of Dec. 29th are good, but they do not entirely agree with our experience.. Although the writer has had no experience in an exchange equipped wholly with kick coil telephones, he has worked on two instruments of this kind which were taken from a salesman for a trial. They seemed to give good results, but perhaps this was because they were favorably located, as one was in the home of a director and the other used by the construction foreman.

"One was in service about six months and the other over one year without trouble or a change of batteries. We have in our office a Stromberg-Carlson 1,200-line multiple visual board.

"Our visual signals are not rung up by the generator. A pulsation from any source simply closes a very close contact, which cuts in the storage battery through an electro-magnet coil, whose action pulls the visual up and holds it until a plug is inserted, which opens the battery, allowing the visual signal to return to the inactive position.

"Clearing out signals are wound to 500 ohms. Not only is this visual line signal very sensitive, but clear outs are so as well, and positive.

"The line at the home of the foreman was common return and heavily loaded, the return being light. His instrument always worked well. To experiment, we cut another series instrument in series with his telephone, the second instrument being between the kick-coil and office. The coil would kick the target every time and also would clear out, lighting the pilot lamp. These telephones were connected on two jacks. The writer placed 6,000 ohms of No. 36 German silver wire in one line and was able to kick a signal and when the two were connected together was able to clear out from either. This was a shop test.

"In practice the foreman found that if he removed his receiver very quickly he would not signal the board. This might be explained by assuming that if the hook snapped up suddenly, allowing the contact to pass very rapidly, it might not give the coil sufficient time to saturate before it discharged to do its work. This could probably have been remedied by a little change in the coil contacts by the manufacturer. If this trouble existed in all of them the public would need a little educating. Such a remedy as is suggested, however, might bring in constantly the trouble from throwing the clearing out signal when the called subscriber came in on the line, as mentioned by your other correspondent. It appears that our telephones did not always throw the clearing out drop when a call was answered, and this may, possibly, be attributed to the fact that a person as a rule takes his receiver off the hook much more quickly when answering a call than when calling for a connection. This explanation is in line with that given for the occasional failure to throw the line signal.

"The engineer's statement as to the battery going to pieces very quickly on account of a short circuit through the kick does not correspond with our experience. The make and break contact to operate the kick is so rapid that the current consumption does not amount to anything. With a five-minute conversation and its requirements there would be hardly any comparison. These telephones talked up well and were good over bad lines, connection having to be made through several switchboards, after the battery had been used one year to operate the kick coil and transmitter also.

"There is one thing which is sure, and that is, just as stated by the engineer who wrote for your issue of Dec. 29th, that if you got in the circuit and removed the receiver, you were not certain whether the coil kicked you or something else."

W. C. S., Ind.

The trouble due to the action of the contacts in this type of instrument seems to be generally experienced. This is confirmed by another telephone manager, who writes as follows:

"With reference to kick coil telephones, we have not found them satisfactory, especially as we have a plunger type of drop that is not sensitive though positive. A common trouble is that, with only two cells of battery, the passing contact of the hook is too short to secure the maximum effect of the coil at either make or break, especially when, as frequently happens, the receiver is slipped off the end of the hook, allowing it to fly up suddenly instead of the way intended. While I greatly admire, enjoy and agree with the writer in the issue of Dec. 29, I might suggest that transmission does not suffer so seriously, because the batteries are O K for the transmitter long after they have passed the pink of condition required for kick coil, but this is not economy."

B. D. H., Pennsylvania.

A SUPERVISING CIRCUIT FOR A MAGNETO SWITCHBOARD.—(818.)

In THE AMERICAN TELEPHONE JOURNAL issue of January 5, 1907,an inquirer asks for information about a quiet supervising circuit. We have found the following to meet all requirements: A third winding of wire of the same size, and having the same resistance as the secondary coil, is wound on the outside of the induction coil of the operator's set. The terminals

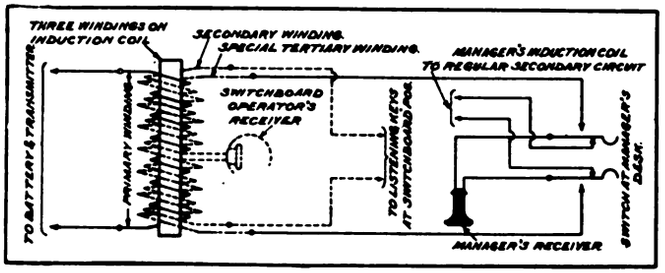

Fig. 818.

of this third winding are led directly to a receiver placed within easy reach of the manager.

We use a modification of the ordinary hook switch to break the circuit when the receiver is not in use, but a switch might be provided so that the regular telephone receiver could be used instead of the extra one. No sound is produced in the operator's receiver when the manager listens in to supervise a connection. We have used it for three years and the operators do not even dream of its existence.

G. J. S., Ia.

SWITCHBOARD CABLE IN IRON PIPE.—(819.)

We have to carry a number of wires across a basement, and the most convenient method is to use a switchboard cable in an iron pipe. Would the insulation stand up under these conditions? C. R. F.

Under the conditions you mention the insulation would soon be so much damaged by moisture that you would have bad cross talk. It is impossible to avoid "sweating" in a buried iron pipe subject to changes in temperature. The effects of this might not make themselves evident for a few weeks, but are bound to come eventually. So much moisture would accumulate that it would probably be undesirable to even use a cable made up of rubber insulated wires. We would suggest the use of a lead covered cable with cotton insulation. The ends should be boiled out in wax.

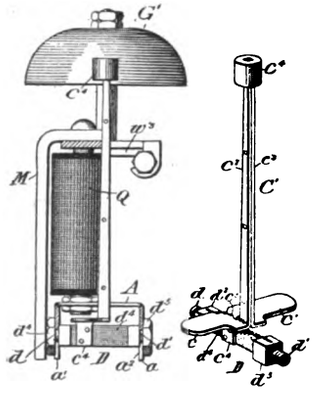
TELEPHONE PATENTS

POLYSTATION SIGNALING.

William W. Dean, Elyria, Ohio, patents (No. 840,995; dated, Jan. 8, 1907; filed May 19, 1905; serial No. 261,132) and assigns to the Dean Electric Co., Elyria, O., a method of polystation signaling.

The patent covers a method of selective harmonic signaling which comprises the following steps: Communicating to a stiff tuned reed successive small increments of periodic energy of a proper frequency, and thereby raising the reed from an inactive condition to one of active vibration. Energy is stored up in the reed, causing it to vibrate with gradually increasing amplitude, until at the point of maximum amplification the interposition of a positive stop prevents further advance of a part of the vibrating structure so that the entire cumulative energy will be imparted to the remainder of the structure to produce a stroke at such accelerated velocity as not to alter the normal periodic vibration of the structure as a whole.

In the embodiment of the invention described, armature stud D carries studs d d^1 held in slotted extensions a a^1 in armature yoke A. These studs are formed upon terminal blocks d^2 d^3 con-



nected by a stiff spring d^4, the ends of which are riveted in slots in the blocks. The armature C is formed integral with clapper rod C^1.

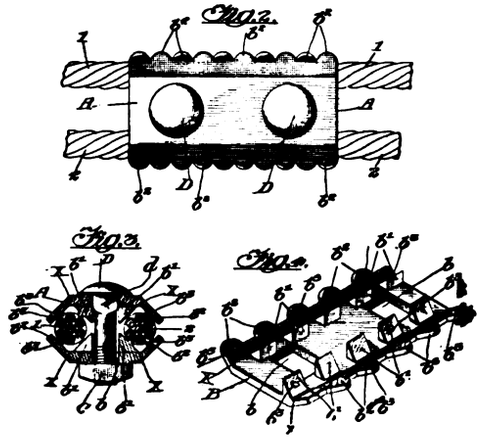
A selective reed is thus formed of parts D and C^1, and its period of vibration is determined by the position of clapper C^4 upon the rod. In operation when a current of proper frequency is thrown upon the line the reed will commence to buzz, armature wings c c^1 approach to and recede from pole pieces q q^1 with successively increasing amplitude of vibration and a corresponding increase of the force of attraction. The cumulative force soon causes one armature end to forcibly strike its pole piece, whereby the armature is stopped. Clapper c^4 will continue to travel. Owing to the resiliency of rod C^1, the clapper strikes the gong and instantly recoils, the action occurring without its natural period being substantially effected.

CABLE CLAMP.

Frank B. Cook, Chicago, Ill., patents (No. 839,919; dated, Jan. 1, 1907; filed Oct. 10, 1903; serial No. 176,457), a cable-clamp.

This clamp comprises a pair of jaws A and B, adapted to be drawn together by nuts C on bolts D. Jaw B has square openings b, to receive the square portions d of the bolt, in a manner which prevents the bolts from turning. This jaw is provided with inner rows of teeth b^1 and outer rows of teeth b^2. Teeth b^1 at one side of the center line alternate relatively to teeth b^2 at the other side and teeth b^2 have a staggered arrangement relatively to the adjacent teeth b^1. Certain teeth are provided with small projections b^3 on their inner surfaces.

The other jaw A can be a duplicate of the jaw B. When



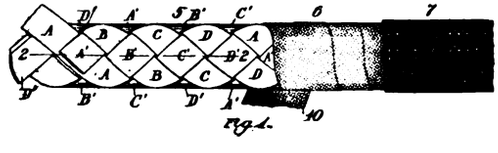
turned face to face the teeth of one jaw alternate with similar teeth of the other jaw. The effect of the staggered arrangement of the teeth is to provide V-shaped clamping grooves, which permit of considerable variation in the size of cable to be held.

CONDUIT.

Louis A. Jones, Cambridge, Mass., patents (No. 840,066; dated Jan. 1, 1907; filed Oct. 17, 1904; serial No. 228,675) and assigns to the American Circular Loom Co., Chelsea, Mass., a flexible conduit.

This conduit is built up of a tube 5, a protective wrapping 6, and an outer tube 7. The inner tube is formed of flat strips of resilient insulating material, A, B, C and D, each wound in the form of a right hand helix. Interlaced with these strips are similar strips A', B', C', D', wound to form left-hand helices. These strips are preferably made of such a width and wound at such a pitch that they cross each other at right angles, as in this way it is easier to form a short bend at the points of intersection and also makes it impossible to greatly elongate the tube by a pull.

Protective wrapping 6 consists of a flat strip of adhesive ma-



terial 10, wound in helical form, and intended to afford a means for protecting the tube 5 so that the waterproofing composition and mica, subsequently applied to the conduit, may not penetrate to its interior. The outer tube 7 is preferably a tubular layer of woven fabric, which serves to protect the inner layer and render the conduit as a whole non-extensible. After this has been applied the conduit is submitted to a process by means of which it is covered with a waterproof and insulating composition, and is then run through powdered mica to give it a sparkling appearance of a distinctive character.

HARTFORD, CONN.

OUR '07 CATALOGUE SENT ON REQUEST

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE—1,000 Kellogg magneto telephones; Viaduct Mfg. Co. ringers; Wabash Cabinet Company's back boards and battery boxes. Good condition, almost new. Will sell singly or in lots. For particulars, write Kinloch Telephone Company, C. W. Shands, Purchasing Agent, St. Louis, Missouri. 755

FOR SALE—At half price, one hundred forty American Electric four-party, selective, ringing telephones. First class condition—most of them as good as new. Address Zenith Telephone Co., Duluth, Minn. 762

FOR SALE—Fisher Cable Testing Set, high sensibility galvanometer, 100000 ohm coil, Ayston shunt, ½ mf. sub-divided condenser, Wheatstone bridge. Original cost $485.00. Will sell at a bargain. J. W. Wright, 1304 Arch street, Philadelphia. 766

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

POSITION WANTED—Practical telephone man with five years experience wants position as manager of good Independent concern. 27 years old; married; best of references. Willing to invest money with good Independent company. Will handle any system up to 800 subscribers. Address Box 757, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 757

WANTED---Continued

WANTED by Bell Telephone Company, operating 100,000 stations, competent District Managers and experienced maintenance men. Unusual prospects for new men owing to changes in organization. Address Box 758, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 758

WANTED—At once three honest, sober, industrious young men who have some knowledge of magneto switchboards, as well as line work, to take charge of small exchange. State experience and salary expected. No drinker need apply. Address Box 759, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. Southern, Box 166, Leesville, La. 759

CABLE SPLICERS—Wanted, cable splicers to work on paper telephone cables. Highest wages paid to first class men capable of doing all kinds of cable work. For particulars, address Box 761, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 761

WANTED—Responsible position by man with 20 years' experience in telephone business. Thoroughly acquainted with every branch, technical and administrative. Address Box 763, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 763

WANTED—A position in the West or Middle West with an Independent telephone company. Have had 20 years' experience. Best of references. Address Box 764, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 764

WANTED—Position as Manager. At liberty after April 1st. Experience in both magneto and central energy plants. At present manager of a plant of 2,500 subscribers. Best of references. Address Box 765, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 765

SWISHER CABLE HANGER

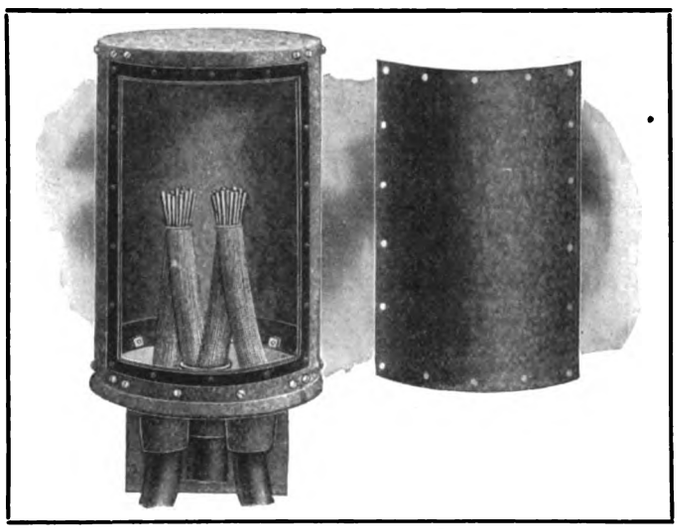
IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

A NEW JUNCTION BOX.

FRANK B. COOK, 238 West Lake street, Chicago, Ill., is putting out a new junction box. The method of manufacture, in which lies the novelty, has made this new box better in many ways than earlier types. In the first place, the new box is made of sheet steel, heavily galvanized, this construction making it very much lighter than the old painted cast-iron boxes. The difference in weight is so great that it will effect a material saving in freight, and also makes it much easier to handle a box on a pole.

This junction box is designed to furnish an economical and simple means for installing and splicing main leads of cable and extending branches of smaller cable to other distributing points. It renders sleeve splicing or wiped joints unnecessary. It makes cable testing a very simple matter, as the box can be opened more easily than can a cable joint. It is claimed to be moisture-proof, and has a sliding galvanized sheet-metal cover which furnishes added protection. The junction box is equipped with self-soldering nozzles. The sheet steel of which the box is made is galvanized after being formed up, so that the galvanizing will fill all the joints and make the box airtight, a rubber gasket rendering the joint between the cover and the box moisture-proof. In order to make sure that the joint actually is moisture-proof, the junction box is subjected to an air pressure test before leaving the factory.



The New Cook Junction Box.

The bottom of the box is about 2 inches deep so that paraffine or a compound may be poured in to that depth, after the cable has been brought in and spliced. This is an additional protection to the cable against moisture.

This new Cook junction box can be furnished separate, or combined with a terminal if desired. One new and original feature of this box is that it may be installed alone originally, and the terminal can then be added at any future time.

All Cook junction boxes are equipped with self-soldering nozzles. Self-soldering nozzles are a great convenience and are really very economical as they save the services of an expert cable splicer or of a plumber to make wiped joints. All that is necessary is to scrape the lead cable sheath bright and clean before inserting it in the nozzle. To solder the cable to the terminal, a blow torch is applied to the outside of the nozzle, first wrapping tape or paper around the bottom of the nozzle to prevent the solder from running out. The necessary amount of solder and flux for finishing the joint is inside of each self-soldering nozzle.

THE PIERSON & DEAN CO., 144 Orange street, New Haven, Conn., manufacturers of the P. D. battery connector described in AMERICAN TELEPHONE JOURNAL, issue of January 12th, is prepared to send out a sample of the connector to managers of telephone exchanges who wish to see the merits of the device at first hand.

Where so much trouble with contacts is experienced as comes up in connection with the use of wire for jumpers between cells of dry batteries, it would seem that a device which may be economically placed and at the same time secure a permanently reliable connection should have a large field of usefulness.

The company firmly believes that this device has these qualities and will be glad to have an opportunity to demonstrate them to every telephone manager who requests information.

THE SWEDISH-AMERICAN TELEPHONE COMPANY, Chicago, Ill., has just opened a new branch office at Sioux Falls, S. D. The building is situated in the central business district of Sioux Falls. Nos. 300, 302, 304 North Phillips avenue being the street address. The company will carry in stock at Sioux Falls a complete line of telephones and telephone line material, packed ready for shipment, and states that orders will go forward the same day they are received.

Sioux Falls is an exceptionally favorable point for Northwestern and Western distribution, the following railroads entering that city: Chicago & Northwestern Railway, Illinois Central Railway, Rock Island Railway, Chicago, Burlington & Quincy Railway, the Chicago & Great Western Railway, and also the Wisconsin Central Railway.

A switch track has been placed for use of the building the Swedish-American Company will occupy so that no delay for hauling material will be experienced by purchasers.

The establishment of this new branch, together with the branch already established at Kansas City, Mo., places the Swedish-American Company in a position to fill and deliver orders very promptly.

The office maintained at Fargo, N. Dak., will be discontinued after February 1, and Mr. C. L. Ward, who has been in charge at that point, will take charge of the branch at Sioux Falls.

FREDERICK PEARCE CO., 18 and 20 Rose street, New York City, has just announced the completion of extensive preparations which it has been making for supplying electrical engineers and laboratory workers with electrical and scientific measuring instruments of superior quality.

About a year ago this company purchased the business formerly carried on by the Willyoung & Gibson Co., New York City, and since that time the requisite facilities in the way of space and equipment have been provided for a thoroughly progressive development of the business. The company has carried its work in this line so far that it now states that it is ready to turn out from its own establishment a full line of electrical and scientific instruments of excellent design and first class construction.

The company is not only able to supply standard equipment, but to develop apparatus from special designs, having an experienced and competent corps of designers and mechanics in addition to the necessary tools and equipment.

It will be pleased to hear from all persons interested in its apparatus, not only for present use, but from those who desire to have their names placed upon the company's mailing list for catalogues and other information which will be issued from time to time.

THE WEEK'S MESSAGES

NEW COMPANIES.

ROGERS, ARK.—A Farmers' Rural Telephone Company is being organized at Rogers to build lines in Rogers, Bentonville, Pea Ridge, Avoca, Brightwater and Garfield.

VAN BUREN, ARK.—The Farmers' Union of Crawford County is preparing to form an Independent telephone company for the purpose of establishing a system of rural telephones. The new company is to have a capital stock of $20,000, and A. L. Keith is one of the principal organizers.

INDUSTRY, ILL.—The Industry Mutual Telephone Company has been organized, and will shortly file articles of incorporation.

TAYLORVILLE, ILL.—A reorganization of the Christian County Telephone Company has been effected by the transfer of the controlling interest from Messrs. Jones and Winters, of Chicago, Ill., to residents of Christian County. The company now has exchanges in Taylorville, Morrisonville, Stonington, Owaneco, Tower Hill and Pana. It is its intention to increase the capital stock from $165,000 to $200,000, the increase in stock to be used to further extend its system.

FRANKFORT, IND.—Articles of incorporation have been filed by the Jefferson Telephone Company, Jefferson, Ind. (P. O. address Frankfort, Ind.) The company has an authorized capital stock of $900 and the incorporators are William H. Engle, Joseph D. Sheirer, J. W. Stafford, Philip Heinbach, W. T. Gillallan, D. F. Young, B. M. Knapp, D. B. Horlacher and Robert Braden.

GARDEN CITY, KAS.—The Garden City Telephone, Light and Manufacturing Company has been incorporated with a capital stock of $150,000. It is the intention to furnish telephones and lights for Garden City. The following directors have been elected: E. L. Wirt, E. E. Wade, Garden City; F. R. Marsh, C. V. Turner, C. W. Kurie and W. H. Spurgeon, of Colorado Springs, Col.

SAUK CENTER, MINN.—The farmers in Birch, Dale, Kandota and Southern Little Sauk have formed a rural telephone company known as the Sauk Valley Telephone Association. Among those largely interested in the company are A. H. Hendrickson and Mr. Trones.

RICH HILL, MO.—A Farmers' Telephone Company has been organized by the farmers south of Rich Hill, whose intention it is to construct a line from Rich Hill to Metz.

VICTOR, MONT.—A Rural Telephone Company is being organized at Victor by A. P. Williamson and T. E. Combs. It is the new company's intention to construct lines between Victor and Stevensville, at both of which places exchanges will be established.

CLIFTON SPRINGS, N. Y.—Articles of incorporation have been filed by the Rural Telephone Company, of Clifton Springs. The capital stock is placed at $4,000, and the incorporators are L. P. Conley, W. H. Vanderhoof and J. J. Johnson, of Clifton Springs.

OKLAHOMA CITY, OKLA.—The New Era Telephone Company, of Oklahoma City, has been incorporated with a capital stock of $20,000. Among those interested in the new enterprise are J. W. Wilson, W. E. Larsh and others.

DUBLIN, TEXAS.—The Dublin Farmers' Rural Telephone Company, of Dublin, has filed articles of incorporation. It is its intention to construct and operate telephone lines in Erath, Hamilton, Comache and Bosque counties. The incorporators are J. G. O'Brien, R. L. O'Brien, M. D. Gallagher, J. W. Higginbotham, Q. H. Humble and J. H. Tull, and the capital stock is given as $20,000.

OTTAWA, ONT., CAN.—Application is to be made to Parliament at the present session for an act incorporating the Bonaventure and Gaspe Telephone Company, Limited, with power to construct, maintain, acquire and operate telephone and telegraph lines in the provinces of Quebec and New Brunswick.

FRANCHISES.

EMERYVILLE, CAL.—Application for a franchise to operate a telephone system at Emeryville has been filed by the Home Telephone Company of Oakland.

PACIFIC GROVE, CAL.—A fifty year franchise has been granted to the Monterey, Fresno and Eastern Railroad to construct telephone lines over certain streets in Pacific Grove.

DE LAND, FLA.—Application for permission to construct telephone lines from De Land through Orange City, Enterprise and Osteen has been granted to S. V. Hough.

BUSHNELL, ILL.—The Farmers' Telephone Association has requested permission of the city council to construct lines in Bushnell.

SENECA, ILL.—The franchise of the Newark Farmers' & Merchants' Telephone Company has been passed at Seneca.

PALMYRA, MO.—The Miller Township Company, assisted by local capital, expects to ask for a franchise to erect telephone lines in Palmyra.

PENASCO, N. M.—A fifty-year franchise has been granted to the Penasco Telephone Company, of which J. C. Gage is president, and H. W. Hamilton is secretary, to construct and maintain a telephone system in the county of Otero.

ST. JOHN'S, OREGON.—Application for a telephone franchise has been made to the St. John's City Council by the Home Telephone Company.

PULASKI, TENN.—A franchise has been granted to the Long Distance Telephone & Telegraph Company at Pulaski.

FINANCIAL.

MARKLE, IND.—The Markle Telephone Company has increased its capital stock from $6,000 to $22,000.

CRESTON, IA.—At a recent meeting of the Creston Mutual Telephone Company an annual dividend of 6 per cent. was declared.

ALLEGAN, MICH.—The Citizens' Telephone Company has declared its regular quarterly dividend of 2 per cent.

KENESAW, NEB.—A dividend of 8 per cent. on its last year's business has been declared by the Kenesaw Independent Telephone Company. The company is now building a number of copper toll lines to take care of its long distance business.

MARSHALL, N. C.—The capital stock of the Wabash Valley Telephone Company has been increased from $125,000 to $400,000.

LORAIN, O.—The Henrietta Rural Telephone Company has increased its capital stock from $4,000 to $8,000, so as to permit of the purchase and operation of a telephone line in Lorain, Huron and Erie counties.

URBANA, O.—The Urbana Telephone Company has declared its semi-annual dividend of 3 per cent.

WILKESBARRE, PA.—The regular quarterly dividend of 2 per cent., payable January 20, has been declared by the Commonwealth Telephone Company.

COMBINATIONS.

CENTRALIA, KAN.—The Southwestern Telephone Company, of Centralia, has sold its lines running southwest from Centralia to E. F. Norris. It is the intention of the new owner to greatly improve the system.

PLAINVIEW, MINN.—The plant of the Plainview Telephone Exchange Company, which operates exchanges at Elgin, Wabasha, Kellogg and Millville, has been acquired by the Greenwood Prairie Telephone Company. It is the intention of the new management to build many new lines and maintain a strictly first class service in all particulars.

ELECTIONS.

MOBILE, ALA.—The following officers and directors have been elected by the Home Telephone Company: W. C. Polk, president and engineer; W. H. Bryant, vice president and general manager; G. C. Monteith, treasurer; R. L. Douglass, secretary; directors, W. C. Polk, W. J. Bryant, G. C. Monteith, Adam Glass, Sr., and P. J. Lyons.

GIRARD, ILL.—The Farmers' Mutual Telephone Company has elected the following officers and directors: E. E. Vaniman, president; R. E. Alferd, vice president; A. A. Neher, secretary; S. O. Smith, treasurer; directors, A. A. Neher, John Riffey and R. E. Alferd.

MEDORA, ILL.—The Brighton Mutual Telephone Company has elected C. P. Long, as president; John Heyer, as vice president; N. Flanagan, secretary; John Ash, treasurer; W. G. Hunt, general manager.

NEWS—WANTED

THE matter contained upon the message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

John Wanamaker says: "If there is one enterprise on earth that a 'quitter' should leave severely alone, it is advertising. To make a success of advertising one must be prepared to stick to it like a barnacle on a boat's bottom. He should know before he begins it that he must spend money—lots of it. Somebody must tell him, also, that he cannot hope to reap results commensurate with his expenditure early in the game. Advertising doesn't jerk: it pulls. It begins very gently at first, but the pull is steady. It increases day by day and year by year until it exerts an irresistible power."

THE WEEK'S MESSAGES

BLOOMFIELD, IA.—The following directors have been elected by the Citizens' Mutual Telephone Company: N. S. Johnson, N. E. Merry, H. C. Leach, C. E. Young, S. S. Standley, C. C. McAvoy, J. T. Kline and L. C. Warthen.

ESTHERVILLE, IA.—The Emmet County Telephone Company has elected the following officers: G. W. Greaves, president; F. W. Knight, vice president; E. L. Pecso, treasurer; E. C. Starks, secretary. The above-named officers, with the addition of G. R. Young, comprise the directorate of the company.

LASSWELL, KAN.—The following officers and directors have been elected by the Ranchman's Telephone Company of Barber county: President, J. W. DeGeer, Deerhead; vice president, J. P. Elsea, Lake City; secretary, W. S. Richardson; treasurer, G. W. Osborn, Medicine Lodge; directors, M. T. Williams, J. T. McGrath and L. S. McElwain. J. W. DeGeer was also made general manager and superintendent, and L. S. McElwain purchasing agent.

UTICA, N. Y.—The Utica Home Telephone Company has elected the following directors: E. B. Odell, H. F. Miller, T. H. Ferris, E. L. Barber, George R. Fuller, W. I. Taber, F. W. Zoller, J. C. Woodbury and C. H. Poole.

AKRON, O.—The following directors were elected at a recent meeting of the Akron People's Telephone Company: Will Christy, H. B. Camp, C. W. De Voe, J. R. Nutt, R. S. Iredell, William Clerkin and W. F. Laubach.

BAINBRIDGE, O.—The Bainbridge Telephone Company has elected the following officers: President, Wm. Howard; vice president, S. A. McFarland; secretary, C. P. Haskins; treasurer, C. R. Post; manager, O. J. Post.

MANSFIELD, O.—At the annual meeting of the stockholders of the Mansfield Telephone Company the following officers and directors were elected: S. N. Ford, president; J. L. Baxter, vice-president; M. D. Ward, secretary and treasurer; directors, S. N. Ford, J. L. Baxter, M. D. Ward, B. J. Balliett, Louis Brucker, Reid Carpenter, J. A. Rigby, A. B. Beverstock, F. M. Bushnell, W. B. Martin, C. W. Upson, W. E. Loughridge, F. W. Bloor, A. L. Cameron and Burton Preston.

ALBANY, ORE.—The following officers have been elected by the Santiam Telephone Company: John Propst, president; F. D. Cornett, vice president; M. Propst, secretary and treasurer; A. Sumpter, M. Thomas, William Carey and E. Smith, directors.

PHILADELPHIA, PA.—The following directors have been elected by the Keystone Telephone Company: F. Wayland Ayer, Marcus Beebe, George Burnham, Jr., Nathan T. Folwell, Clarence L. Harper, James Collins Jones, George Kessler, Hercules Lippincott, Michael Murphy and Jacob E. Ridgway.

MISCELLANEOUS.

LOUISVILLE, KY.—The Central Home Telephone Company has recently installed a number of local exchanges along its trunk line south from Louisville. The exchange in Bowling Green is growing rapidly and already far ahead of the Bell lines. An exchange was put into operation at Russelville a few days ago with 120 telephones working, and another, Greenbrier, Tenn., has about 60 telephones. At Springfield, Tenn., the exchange put in about two months ago now has 400 telephones and is growing rapidly.

DEARBORN, MO.—The Dearborn and Edgerton telephone exchanges have been sold by the Platte County Telephone Company to Mr. Jeffries, of St. Joseph, who will take possession of the plant at once.

RINGWOOD, OKLA.—The Ringwood & Cleo Telephone Company has been incorporated and has elected the following directors: Steve Wilson and Frank Draper, of Forest; J. A. Brown and G. C. Burk, of Ringwood; Clark Weaver and J. C. Bebbitt, of Cleo.

MONCTON, N. B., CAN.—At a recent meeting of the council of the Board of Trade and the telephone committee, Messrs. Presson and Goss, representatives of the Independent telephone movement, gave an estimate of the cost of installing in Moncton an Independent telephone system at $50,000.

OTTAWA, ONT., CAN.—The board of railway commissioners has made new orders with respect to tariffs of telephone companies. All such companies are now required to keep their tariffs on file for the inspection of the public during business hours.

PERSONAL.

E. M. ALINDER, who has been in charge of the Southern Bell Telephone and Telegraph Company's exchange at Warrior, Ala., has recently been promoted to the management of its office at Pinckney City.

O. T. TAYLOR has recently been appointed manager of the exchange at Tulsa, I. T., by the Pioneer Telephone Company.

New Construction in the Field

COPELAND, ARK.—Many new lines are being constructed by the Cotton & Reves Telephone Company. It has entered into an arrangement with the farmers in the vicinity of Copeland by which its lines will be extended in all directions.

CANTON, ILL.—The Canton, Sugarville & Fairview Telephone Company expects to rebuild part of its system.

HECKER, ILL.—New lines are being constructed by the Hecker Telephone Company into St. Clair county.

LEONORE, ILL.—A telephone line is to be built between Leonore and Lostant by F. Z. Ames, of Rutland. It is his intention to secure connections at Leonore with the Leonore Telephone Company.

PORT BYRON, ILL.—It is the intention of the Crescent Telephone Company to construct a new trunk line between Port Byron and Hillsdale, and to otherwise improve its system.

ROCKFORD, ILL.—It is the intention of the Rockford Home Telephone Company to make many extensions and improvements in its system during the present year.

RUSHVILLE, IND.—Among the improvements planned by the Rushville Co-operative Telephone Company is the erection of a new exchange building and the installation of a $25,000 switchboard.

GENEVA, KAN.—The Independent Telephone Company recently organized at Geneva expects to install an exchange at this place, and to build lines connecting with the exchange at Neosha Falls.

KINCAID, KAN.—In order to accommodate its rapidly increasing business the Eastern Kansas Telephone Company proposes to install a new toll board in its main office.

MORRICE, MICH.—The Farmers' Telephone Company plans to construct a line from Morrice to Bancroft.

TRAVERSE CITY, MICH.—Many improvements are planned by the Farmers' Telephone Company at Traverse City.

CROOKSTON, MINN.—A new switchboard is to be installed by the local telephone company at Crookston.

HALLOCK, MINN.—The improvements planned by the Kittson Telephone Company include the rebuilding of its exchange, and the construction of a number of rural lines.

SHELL LAKE, MINN.—It is the intention of the Nichols-Chisholm Lumber Company to build a telephone line to Frazee.

ST. JOSEPH, MO.—Considerable cable distribution is being planned by the Citizens' Telephone Company prior to the installing of its new exchange.

BELGRADE, NEB.—New lines are to be built by the Belgrade Telephone Company from Belgrade to Fullerton.

DODGE, NEB.—The Farmer's Telephone Company, which has already expended $4,000, in reconstructing its lines, expects to make other improvements in its system.

WOODYARDS, O.—New lines are to be constructed by the Citizens' Telephone Company at Woodyards.

ALBION, PA.—Improvements are being made by the Albion Telephone Company in its plant.

LUTHERSBURG, PA.—The S. U. B. Telephone Company expects to build a new line from Luthersburg to Troutville.

BLUEFIELD, W. VA.—New lines are being constructed in Bluefield by the Mercer Telephone Company.

HANCOCK, WIS.—New lines are being built by the Farmers' Telephone Company at South Hancock.

CALGARY, ALB., CAN.—The council of the board of trade has called upon the city council to at once construct a municipal or Independent telephone system at Calgary. This is the result of a meeting of the business men, at which the present service furnished by the Bell Company was unanimously condemned.

FERNIE, B. C., CAN.—The Revelstoke Trail and Trout Lake Telephone Company has promised the local board of trade to build long distance telephone lines to Elkmouth and Hosmer. Address General Manager Lindsay, Revelstoke, B. C.

HARRIETSVILLE, ONT., CAN.—It is the intention of the Harrietsville Telephone Company to make many improvements and extensions in its system.

UNDERGROUND.

PITTSBURG, PA.—The city of Pittsburg is considering the advisability of compelling the telephone companies to place all overhead wires in conduits.

MILWAUKEE, WIS.—The Milwaukee Independent Telephone Company is to install an underground telephone system extending three miles south, two miles west and nearly two miles north from the center of the city. The system will extend east as far as the city limits.

Quality Higher Than Price

¶ It's an easy matter to talk quality and price, but quite another to produce the goods to back it up.

¶ We have always put more faith and dollars into securing good materials and employing skillful and intelligent labor in the manufacture of our telephones than in advertising the fact, and the careful buyers are beginning to find it out.

¶ Prejudice and ignorance may hold the fort for a day, but merit and fair dealing in the end are invincible.

¶ We solicit your inquiries and an opportunity to quote prices and submit samples of our product.

JUST A SUGGESTION

Take one of your busy 4-party lines and equip it with "POOLE" Lock-Outs. Leave it in service a month and then see how many of the four will stand a raise of $3.00 a year rather than go back to the old way. We know the answer, but we want your subscribers to impress on you the fact that the "POOLE" Lock-Out is a rate-raiser.

It won't cost you anything to try it, because we will loan you the Lock-Outs free and there is no other equipment required. Write today for our Booklet AL-2.

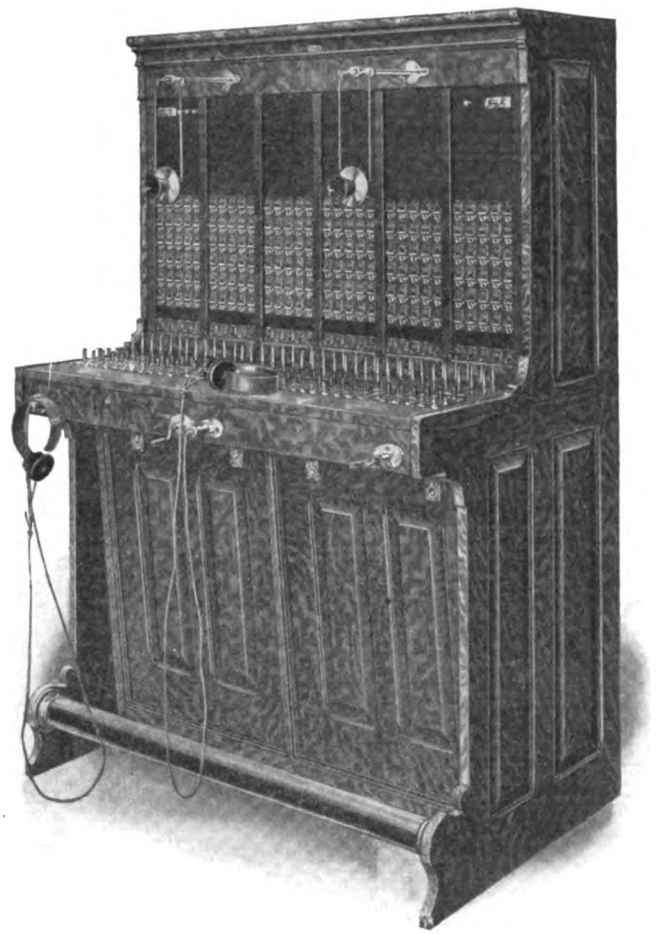
DEAN TELEPHONE APPARATUS

EXPRESS TYPE SWITCHBOARDS



Our express type switchboard cabinets are made in unit form so that any number of sections can be placed in line and give the appearance of a continuous switchboard cabinet. The accompanying illustration shows our No. 8 type cabinet with an ultimate capacity of three hundred drops, thirty cord equipment, thirty lamp transfer circuits and two operators' positions equipment.

If you have not yet received a copy of our new booklet, No. 6, write, call, or telephone; we will mail you a copy free on request.

QUALITY—DURABILITY—EFFICIENCY

THESE features are essential and have made our self-contained Ringers famous. They are in use on all our Central Energy and Magneto Instruments. The permanent Magnet A is made of the finest grade of magnet steel, carefully tempered. The adjustment screw B is made of heavy brass which will perform its work without twisting. This screw is hexagon in shape and slotted, adjustment can thus be made by screw-driver or wrench. The armatures C and cores E are made of annealed soft iron. The plate which supports the armature is made of spring brass of sufficient thickness to possess the proper tension. The yoke F is of heavy brass, forced with great pressure over the cores E, holding them firmly in place. The adjustment of the Ringer is effected by turning the screw B, which has a shoulder resting on plate D, the lower end being threaded into plate F. Long life and perfect satisfaction are assured.

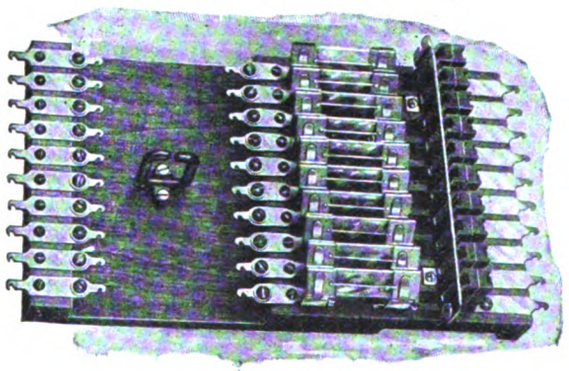
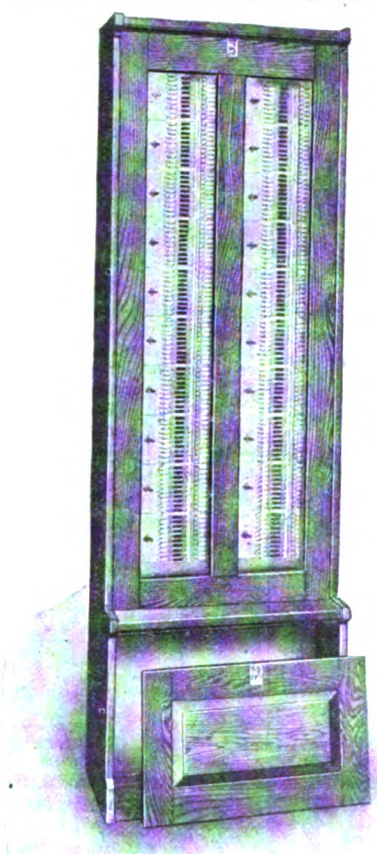
MONARCH

ARRESTERS AND ARRESTER CABINETS

The arresters are mounted five per strip so that it is not necessary to buy more lines of protector than there are lines in the switchboard. The construction shows the usual Monarch Characteristics of strength and durability. The connectors are heavy brass and the spring clips bring sufficient pressure to bear against the fuses and carbons to positively insure good contacts. The ground plate is a wide strip of brass slotted at one end and fitted with a screw at the other end, so any number of sections can be mounted one above another.





The arrester cabinet is designed to fill a demand for a neat and yet inexpensive cabinet for magneto exchanges using fuse and carbon arrester sections. It is made in two sizes: One for 100 metallic lines and the other for 150 metallic lines. The removable glass front and bottom panel afford easy access to the arresters and the cables coming to them.

MAKERS OF GOOD GOODS

TO BE FOREWARNED IS TO BE FOREARMED

If you are not using a measuring instrument to test your lines, get one at once, as you will need it many times before the summer comes. It would be just as sensible for a grocer to try and sell sugar by guessing at its weight as it is for you to try to locate a fault in a line by the same method. PIGNOLET VOLT-AMMETERS are designed to give the best results required for testing purposes. They are not complicated nor do they require experts to operate them. Another point in their favor is their low cost. There is no instrument on the market which will give you as accurate results at anything near the price. Hadn't you better write for prices and further particulars By buying one now you will save its cost many times over before you have had it a year.

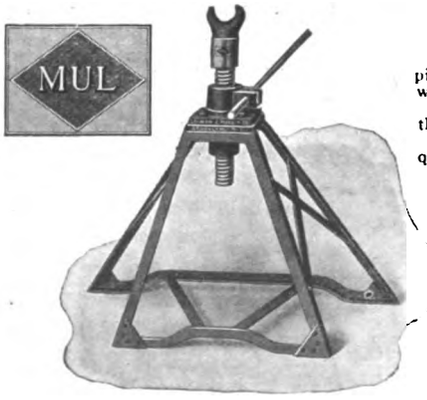
"Triumph" Reel Jack



The "Triumph" and "Perfection" Reel Jacks

"Perfection" Reel.

The nut revolves instead of the head, enabling the head to be made in one piece. It is, consequently, very rigid and never works loose as is the case where the head acts as a pivot.

The stand proper is not threaded, so the whole screw may be taken out and the jack taken apart for transportation.

The "Triumph" jack is very compact, taking up but little room and consequently is advantageous where the manhole is alongside of a car track or other tight place.

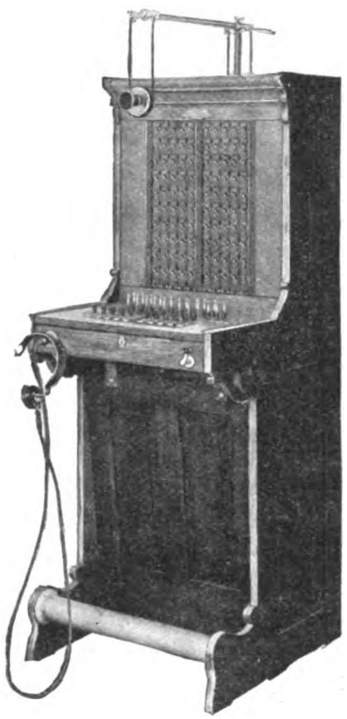
KELLOGG

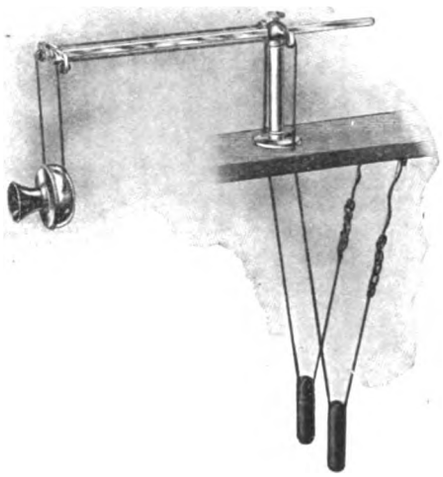
TELEPHONE APPARATUS

MAGNETO SWITCHBOARDS

ARE EQUIPPED WITH KELLOGG

SOLID BACK REVERSED TYPE TRANSMITTERS





This transmitter does not vary in any vital part from the regular Kellogg telephone transmitter. It is of the solid back reversed-type, the cell which contains the electrodes and granular carbon being formed in the diaphragm and constituting a part of it.

This form of a transmitter gives wide variation of resistance with a correspondingly powerful transmission. The action keeps the granules well shaken up, thus preventing packing. A soft rubber gasket separates the metal diaphragm from the remainder of the instrument, thus preventing metallic contact with the frame of the transmitter. Two dampening springs hold the diaphragm in place. The front of the transmitter to which all the working parts are attached, is made of white metal cast in accurate steel dies under enormous pressure. The bridge forming the solid back of the transmitter to which the rear electrode is clamped, is made of a straight piece of heavy brass, without any bends or angles, and is fastened to the front piece by four machine screws. The back is spun of sheet brass, heavy enough to avoid all vibrations caused by the voice. The transmitter is suspended from the arm by two 72-inch green silk cords. The No. 24 transmitter arm shown above is made of brass, nickel-plated, 24 inches long, with a standard 6 inches high. This arm provides pulleys over which the cord slides. The arm has a horizontal adjustment of 18 inches. The transmitter is so balanced by cord weights that it will remain in whatever position it is placed.

20 Pair Bank—No. 10.

Cook's No. 10 Protector

COOK'S No. 10 Protector is so radically different in principle and design from previously existing types of switchboard protective apparatus, and has so many vital points of improvement, that from an engineering standpoint, it belongs in a class by itself. The following features alone are enough to recommend it to every careful, conservative, conscientious telephone engineer:

1. *The heat coil is not made of wire; it cannot burn out or short circuit.*
2. *There are no loose contacts in the circuit.*
3. *There cannot be a defective coil in the circuit.*
4. *The springs of each pair are separated and insulated from all adjacent springs.*
5. *No bolt connections are used to transpose the line and the switchboard terminals; consequently there can be no loose connection in the circuit.*

Cook's No. 10 Protector is a resoldering but not a self-soldering protector.

It is mechanically and electrically simpler and better than *any* protector on the market.

16,000 pairs of No. 10 were installed at St. Louis main office—the largest single protector rack made.

Write for descriptive bulletin and prices.

You Wouldn't Start a Horse Car Line

in this age of electric cars? Not if you wanted to make money out of the business of transportation.

Then why should you start a manual telephone exchange in this age of automatics, if you want to make money out of the telephone business?

The automatic system of telephony bears the same relation to the manual system that the electric car does to the horse car. It is the apotheosis of telephone development, as the electric car is of transportation development.

The automatic telephone system produces the best service more economically than indifferent service can be produced with manual equipment.

There is no more question as to the relative popularity of the automatic and manual telephone service where the two kinds are in competition than there is as to the relative popularity of the trolley car and the horse car.

And, as for the securities—the same comparison may be applied with the same results.

Our Automatic system has been adopted in the following cities:

Aberdeen, S. D.	Clayton, Mo.	Jonesboro, Ark.	Ocean Park, Cal.	Springfield, Mo.

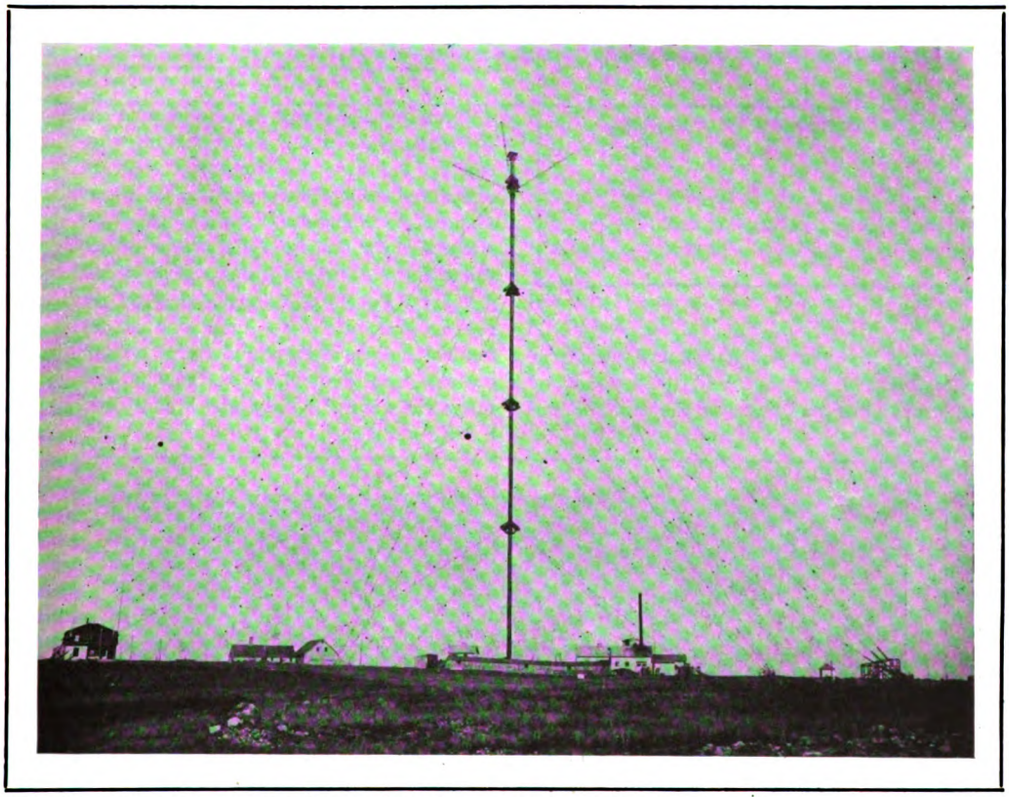
Experiments and Results in Wireless Telephony*

By John Grant.

MODIFICATION of the character of the electro-magnetic waves to impart the fluctuations characteristic of the current in a circuit containing an ordinary telephone transmitter has been the object of an exhaustive series of experiments by Professor Fessenden, second only in importance to those which led to his development of a satisfactory system for radiating energy. It is evident that the forms of the electro-magnetic waves must be varied exactly in correspondence with the sound waves of spoken words at the transmitting station, and at the receiving station the apparatus must be capable of retransforming the energy into sound waves of like character to those originated at the distant end of the system. An early arrangement tried at the transmitting end of the line was of the form indicated in Fig. 5.† Here the conductor from the aerial passes through a winding 2 of the transformer 3 to the source of energy (here represented by induction coil 6), the other terminal of which is connected to ground. Capacity 18 and inductance 19 in series shunt spark gap 4-5 for the purpose of maintaining constant frequency, as previously described with referenced to Fig. 3. Transmitter 9 and battery 8 are serially included with a second winding 7, on transformer 3. Capacity 18 and inductance 19 are arranged to have the some period of oscillation as the sending conductor 1, and also as the receiving conductor. Advantage of the fact that if the resistance of a transformer secondary be changed it alters the inductance of the primary is taken to produce the required modifications of the waves emitted. Thus by speaking into the transmitter the permeability of the core 3 is correspondingly modified, producing a change in the self-inductance of the winding 2. This in turn affects the natural period of vibration of the sending conductor, throwing it out of resonance with resonating circuit 18-19. Owing to this variable failure of resonance there is produced a series of corresponding changes in the intensity of the waves given off by the conductor 1, and these variations are reproduced in the circuit of the receiving conductor. It is to be noted that the essential point in the operation of this method of transmission is the throwing of the aerial out of tune with the resonant circuit 18-19, and an alternative method of doing this is to alter the capacity of conductor 1, instead of its inductance. To affect this type of variation, conductor 1 was connected to a fixed condenser plate 13 (Fig. 6), while plate 14 is formed by or connected to a diaphragm capable of vibrating in unison with sound waves, produced by words spoken into a transmitter mouthpiece. This latter arrangement has been termed by Professor Fessenden a "condenser transmitter." Relating the practical results obtained with this type of apparatus in conjunction with the high frequency dynamo for generating waves he states that with a diaphragm two centimetres in diameter a movement of 1-100 of an inch inwards reduced the current from 3.1 amps. to 2.5 amps. This result was obtained on a circuit used for telephoning from Brant Rock to Plymouth, a distance of about ten miles. The dynamo was connected to the aerial through a transformer with 10 and 100 turns respectively, stepping up the voltage from 45 volts to approximately 3,000 volts, with a frequency of 50,000 cycles. This result was obtained without a resonant circuit between the movable terminal of the condenser transmitter and ground.



Four Hundred and Twenty Foot Mast and Buildings at the Brant Rock Experimental Station, from Which Wireless Telephone Messages Are Sent.

In Fig. 9 is shown a third arrangement using a carbon microphone transmitter, 16-17, in circuit between the sending generator

*Continued from the issue of January 26.
†U. S. Patent No. 706,747.

Digitized by Google

15 and aerial 1. A proper type of transmitter for this purpose should be capable of carrying from 10 to 100 amperes. In the practical instrument which has been developed the metal en-

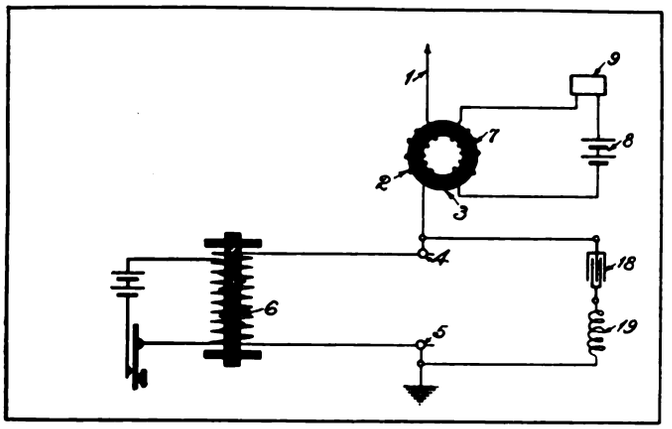


Fig. 5. Arrangement for transmitting speech by varying inductance of sending circuit.

closing the carbon chamber is made with two deep circumferential grooves, visible in Fig. 11, permitting the rapid radiation of such heat as may be produced.

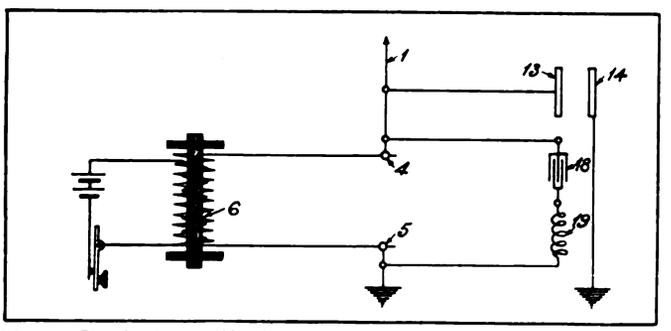

Fig. 6. Circuits for modification of transmitted waves by action of a "condenser transmitter."

In operation, the sending conductor has its natural period in resonance with the period of the dynamo, and the amount of resonant voltage depends upon the resistance of the microphonic contact. Speaking against the diaphragm therefore causes the voltage at the aerial terminal to change in correspondence with the sound waves. This microphonic contact may be substituted for the variable inductance or variable capacity in conjunction with the resonant circuit 18, 19 as shown in Figs. 5 and 6. While the condenser transmitter has given the best results, the carbon transmitter works very well in practice. The instruments as now constructed have platinum-iridium electrodes, and carry three amperes without injurious heating. To get the best results the ohmic resistance of the carbon transmitter should be equal to the radiation resistance of the aerial. In practice the carbon transmitter is usually placed between the exciting source and ground, as shown in Figs. 12, 14, for the purpose of preventing possible shocks.

A carbon transmitter may also be placed in the field of the high frequency alternator. Still another method is to use the armature winding differentially, with a second field, to shift the position of the field. Many other forms of transmitting devices for varying the natural period of the sending aerial circuit through the action of a transmitter upon a spark gap, etc., were experimented upon, but were laid aside on account of the objectionable noises which they produced in the receiving circuits.

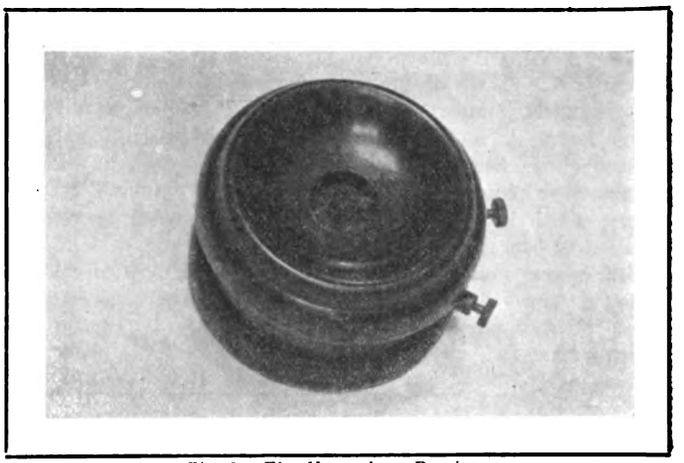

Fig. 8. The Heterodyne Receiver.

Receiving apparatus at the time Professor Fessenden began his work was in an unsatisfactory state, all known forms of receiver being of the "imperfect contact" type. These were not considered satisfactory, as it is well established that a receiver adapted to reproduce speech must be constantly operative. Moreover the known types were all voltage operated devices, and the thing required was recognized to be a current operated receiver. Forms of current operated receivers were devised, to the number of more than one hundred. In all these the fundamental principle is that all contacts are electrically good contacts, and the devices are capable of being operated by electromagnetic waves.* They are broadly distinguished from devices depending for their operation upon the varying of contact resistance, as in the "coherer" types of receiver. Amongst these types of receiver which have become well known may be mentioned the hot wire barretter, the liquid barretter, the eddy current receiver, the beats method, the microbaric receiver, the repulsion disk, etc. Of these the most satisfactory for telephone work was found to be the liquid barretter. This type of instrument consists of a small vessel containing a liquid in which is immersed a diaphragm perforated with a minute hole, before which is placed a fine point connected with the antenna. Under the

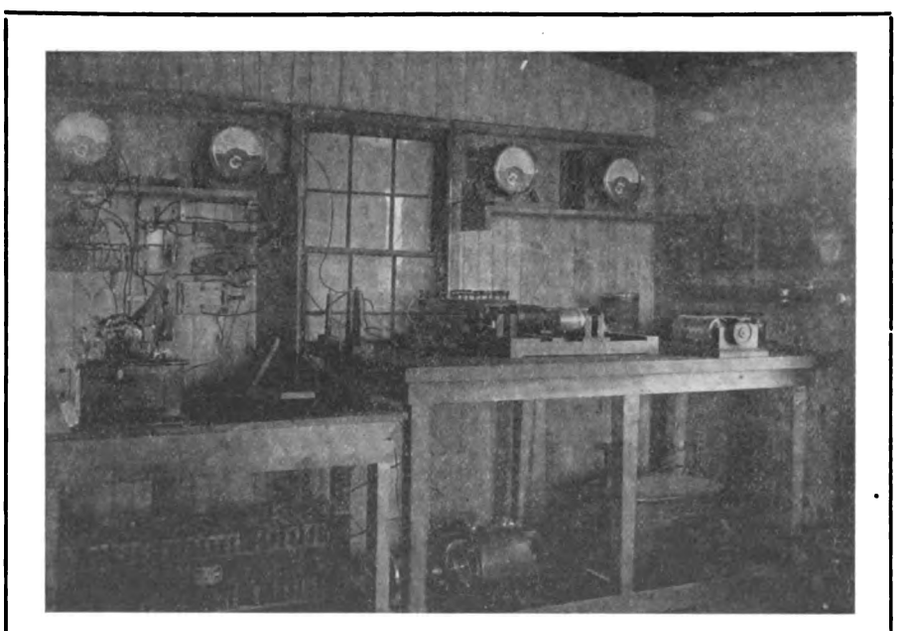

Fig. 7. Arrangement of apparatus for transmitting from graphophone shown at the left.

*U. S. Patent No. 706,736.

Digitized by Google

action of the electro-magnetic waves the stratum of liquid contained in the perforation of the diaphragm becomes heated, its resistance is varied, and if the terminals be shunted by a battery and receiver sounds will be produced corresponding to such fluctuations in resistance. The inventor of these various forms of receivers believes, however, that they are all surpassed by what he terms his "heterodyne" receiver. Although this cannot be fully described on account of the condition of patents, the following data are available:

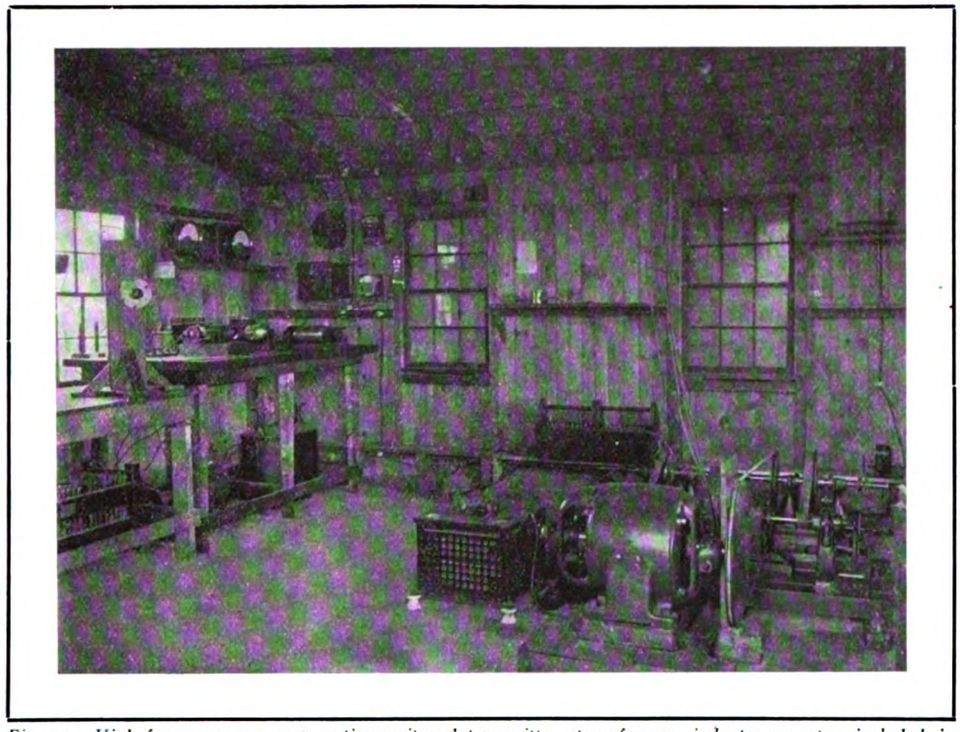

Fig. 10. High frequency wave generating unit and transmitter, transformer, inductances, etc., included in complete sending circuit.

All forms of voltage operated receivers, and most forms of current operated receivers are very inefficient. Even the liquid barretter, which is recognized as an exceptionally sensitive instrument has an efficiency of only about 1-10 of one per cent for weak signals. The magnetic receiver of the types developed for wireless telegraphy is in the same class. While a liquid barretter or magnetic receiver will give an indication between 1/100 and 1/1000 of an erg., an ordinary telephone will indicate the passage of less than 1/1,000,000 of an erg. From this it is evident that a proper method for directly using an ordinary telephone receiver would increase the efficiency enormously. This has been accomplished in the heterodyne receiver, which is a combination of the "beats method,"* and the method of operating by continuously generated waves,† which has already been described. The beats method requires the use at the sending station of two or more antennae, so constructed and proportioned as to have different periods of oscillation—in practice a difference of about 5 per cent being preferred. At the receiving station two or more conductors are connected to separate windings and of a receiver magnet. Separate alternators are used, tuned to frequencies corresponding with the periods of the aerials to which they are respectively connected. As the device is operated waves of different periodicities are generated by the respective sending conductors, and these waves produce in the corresponding receiving conductors correspondingly varying oscillations in potential. As the oscillations persist there follows a varying difference of potential at the receiver terminals, and corresponding signals caused by the electrical "beats," analogous to sound "beats" will be heard. The heterodyne receiver (Fig 8) is built up of a telephone having a fixed magnetic core formed of iron wires .001 inch in diameter, and this core is excited by a high frequency current. A small coil, with or without a core, is cemented to a thin mica diaphragm, and this coil is arranged to be excited by the oscillations produced by the received electro-magnetic waves. While it is impossible to make the frequency of waves generated at the sending station exactly equal to the oscillations generated at the receiving station, it is believed that regulation sufficient for all practical purposes may be obtained by automatic means. This gives an extremely efficient form of receiver. Advantages pointed out by the inventor of this type of receiver are that it is unaffected

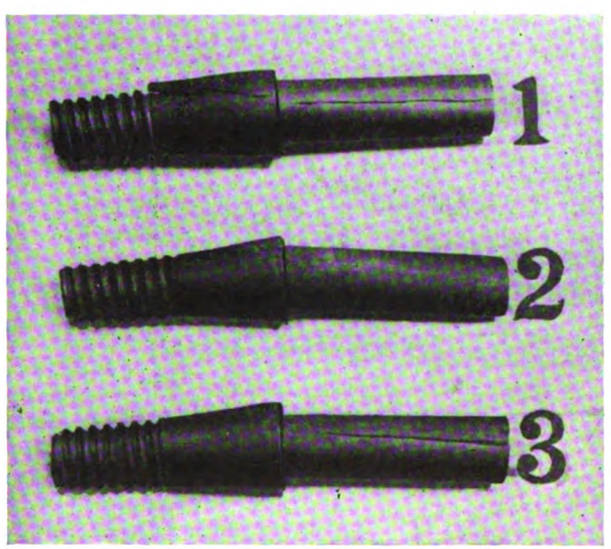
The Strength of Insulator Pins

AT the request of certain consumers, the Forest Service recently made tests on fifty-three insulator pins of rock elm, live oak, and black locust, the results of which are given in the department's Bulletin No. 12. The tests were made at the timber-testing station of the Forest Service at Purdue University, Lafayette, Ind. The results indicate the relative strength of the pins tested. They depend upon too small a number of tests, however, to show in an authoritative way the relative value of these woods.



Failures of insulator pins—1, splitting from threads to shoulder, characteristic of failure of locust and elm pins. 2, tension at shoulder, characteristic failure of oak pins. 3, shearing horizontally; occasional failure within the block.

The pins were of standard size, 1¼ inch by 8 inches. The oak pins were from ⅛ to ¼ inch shorter than the others, and of slightly smaller diameter at the shoulder. Their lever arm was also about ½ inch shorter than in the cases of the other two species.

In testing the pins an iron block was clamped to the fixed upper head of a small screw-testing machine. The pins were inserted to a tight fit in a hole in this iron block, and projected horizontally over the pulling head of the machine. The glass insulator was unable to bear the strain of the wire, so an iron model of the ordinary glass insulator was screwed on the pin and connected by means of a heavy wire to the pulling head of the machine. When a strain was put on this wire, the pin acted as a beam fixed at one end and loaded at the other, which is practically the condition met with in practice. The breaking moment (maximum load times lever arm) is taken as a measure of the strength of the pins. The iron block mentioned was used in preference to a wooden cross arm for supporting the pins, for the reason that this iron block forced the pins to break under the test. Furthermore, it furnished uniform conditions for all pins. Thus, the results of the tests do not show the strength of a combination of pins and cross arm, but they show the bending strength of the pin itself.

Species.	No. of Tests.		Weight of pin. Grams.	Rings per radial inch.	Breaking moment (Maximum load x lever arm). (Inch lbs.)
Black locust From Boston, Mass.	23	Avg.	106.3	12	3970
		Max.	119.3	25	5380
		Min.	86.6	3	2520
Black locust from Nashville, Tenn.	7	Avg.	125.9	8	4087
		Max.	147.1	11	4930
		Min.	111.8	4	3010
Rock elm from Nashville, Tenn.	8	Avg.	93.8	42	2512
		Max.	108.7	48	3150
		Min.	77.5	33	1450
Live oak from Houston, Texas.	12	Avg.	127.1	Not distinguishable.	3025
		Max.	141.0		4590
		Min.	110.4		1990

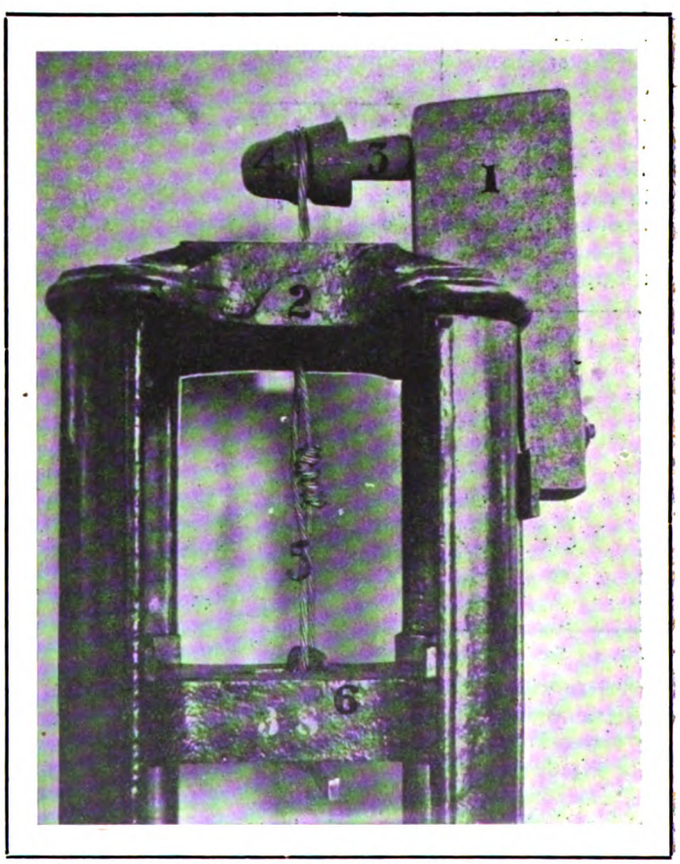
Tabulated results of Forest Service tests on insulator pins.

The accompanying table gives the results of the tests.

From the table it appears that the breaking strength of the two shipments of black locust pins was practically the same, and may be taken as 4,000 pounds. Live oak pins came next in order of strength, with a breaking moment of about 3,000 pounds. Rock elm pins were the weakest, having a breaking strength of 2,500 pounds.

The oak pins were the heaviest, the locust next, and the elm the lightest.

The locust and elm pins failed mostly by splitting from the threads to the shoulder, or by tension at the shoulder. Occasionally the portion of the pin inserted in the block failed by shearing horizontally. The oak pins nearly all failed by tension at the shoulder.



Testing device for insulator pins—1, cast iron block; 2, upper fixed head; 3, pin under test; 4, iron dummy insulator; 5, heavy wire; 6, pulling head

WINNING PROVIDENCE FOR THE INDEPENDENTS.

HEARINGS which were held on January 15, 16 and 17 before a special committee of the City Council of Providence, R. I., gave the Home Telephone Company of Rhode Island an opportunity to thoroughly present its claims for the consideration of its application for a telephone franchise.

The Home Telephone Company of Rhode Island, on the evening of January 15, opened its case before the City Council and citizens of Providence in its application pending for a franchise. Such a great interest had been aroused among the citizens, who realized the importance of this opportunity to hear

The Nebraska Independent Telephone Convention

OVER one hundred members of the Nebraska Independent Telephone Association were present at the opening of the annual convention at Lincoln, on January 22. This number was increased, by arrivals the same evening, to one hundred and fifty, with more to follow.

The feature of the first afternoon session was the address of the president, F. H. Woods, of Lincoln, on the year's work in Nebraska. It refers to a remarkable showing of growth and development during the year. Among the statements of general interest are the following:

"It is highly important that each telephone company should know not only its own business but that it should also keep fully posted as to what its neighboring connecting companies are doing. When many of us embarked in the telephone business, we sought to get good local service at reasonable rates. We thought that when our local plants were installed, the business would take care of itself. The demand for extension of service has exceeded all of our expectations and we find our small companies growing into large ones with no prospect of any abatement in the future of the marvelous growth that has been taking place. We have awakened to the realization of the fact that we are a part of a large system, complex in its nature, and that our patrons demand telephone connections with neighboring towns as well as good local service.

"The citizens of Nebraska have as yet but little conception of the magnitude of the Independent telephone movement. When they need the use of a long distance telephone line, through force of habit, they go to the Bell telephone. Their Bell directory for years has listed its subscribers throughout the State, while our Independent directories have been wholly local in their character. During the past year our long distance lines have been extended and our service greatly improved, until to-day in central and southeastern Nebraska we have more than forty-two thousand telephones connected together by good toll lines.

"A few months ago your executive committee instructed our State secretary to take up this work, and, if possible, arrange to publish a State directory. The result of his efforts is now in your hands, and I think you will agree with me in saying that the directory which we have published would do credit to any State association. It is said to be the largest Independent telephone directory ever published. We regret that it does not list all of our companies, and we are aware that there is room for some improvement along other lines, but I think we have made a good start.

R. E. Mattison.

"In order to get it out, we had to get the co-operation of the different companies to be listed. This never could be accomplished until the management of the State Association had obtained their confidence. Our present secretary has succeeded to a remarkable degree in getting the different companies interested in the Association work and in getting them to pull together. To-day we have an Association that is a powerful engine for the advancement of the Independent interests.

"Our secretary is also manager of the Telephone Traffic Association of Nebraska. He has succeeded in organizing and putting into operation a clearing house that is now clearing the joint toll business of practically all of the companies in the State operating toll lines. At the beginning only twenty-one companies reported to the association, and some of them joined only on probation. Now forty-three companies are clearing through the Association, others are joining as the toll lines are extended, and the business cleared is showing a steady and healthy growth."

Referring to the benefits of membership in the International Association, President Woods said:

"The telephone business cannot be confined by State lines, and if we are to attain the fullest share of success that the future has in store for us, we must become an integral part of the great Independent system extending throughout the settled portions of the North American continent. In the upbuilding of this great system, we need the guidance and assistance of a strong national organization. There is a great amount of work for such an organization to do. It will point the way of progress and will warn us of Bell pitfalls. Above all, it will inspire confidence in the success of our great undertaking. It will demonstrate to the public that we are larger and stronger than the monopoly that seeks to throttle and destroy us. It will give the public the truth about the Independent telephone movement and will put the 'publicity bureau of misinformation' of our competitor out of business. As soon as the people generally have confidence in the stability and ultimate success of our companies, we will have no lack of financial support. There is money all around us seeking investment, and as soon as the investors learn that they can safely invest in our enterprise, the work of financing our companies will be accomplished. This work of the National Association should receive our hearty support. They need money to carry out their plans, and we must assist in raising it.

"There are to-day some alleged trust and security companies in different parts of the United States that are advertising to finance Independent telephone companies. Some of them are frauds of the worst character and are seeking information of your business affairs for the purpose of selling it to your competitor. Before having any dealings with any concern of this kind, be careful to investigate its reliability and responsibility."

Following the president's address, which was received with enthusiasm, committees were appointed as follows:

Credentials.—J. D. Clark, of Papillion; R. E. Mattison, of Lincoln; G. E. Becker, of Pawnee.

Auditing Committee.—W. S. Clapp, of Kearney; T. H. Pollock, of Plattsmouth; W. K. Daubendick, of Dewitt.

The Western Telephone Company created a pleasant ripple by offering the free use of its toll lines to any delegates wishing to talk to their friends outside of the city. Manager Hurtz, of the Lincoln Telephone Company, invited the delegates to make themselves at home in the company's building. The evening was spent by delegates inspecting the exhibits of manufacturers.

The real telephone convention commenced Wednesday morning. The number of delegates in attendance had increased to 150 since the afternoon adjournment, and business was started promptly.

The first business to come before the morning session was the report of the secretary-treasurer, R. E. Mattison, of Lincoln. He discussed the condition of the Independent companies and the great improvement brought about during the year. The fight with the Bell company to prevent sub-licensing of local exchanges has kept the secretary jumping all the year, and he has gained much credit among the Independent men for the skill and diplomacy, added to genuine fighting qualities, which have made him successful in hundreds of contests. The following are

Digitized by Google

abstracts from important portions of the text of his report:

"Early in the year the Bell company sent a great many representatives into our territory, expecting to sub-license a large percentage of the smaller companies. They started out with the regular sub-license contract, which provided, among other things, that the company accepting such a contract should sever all its connections with the Independent companies and use the Bell lines exclusively. This contract was always drawn for periods of from one to ten years.

"After trying this proposition for four months with no results, it was abandoned and a new proposition was presented, which they considered would get the business. This time they offered to connect their lines with Independent companies and take such business as the Independent companies chose to give them. The Independent companies were not required to discontinue any of their Independent toll line connections, in fact there were no restrictions of any kind in the agreement. These contracts were drawn to cover periods from 30 days to two years. This proposition is still being presented to the Independent companies by their sub-licensing agents.

"We have met these agents at a hundred different places and in almost every case have won our fight. Some of these encounters have been before joint meetings of town boards or commercial clubs or local telephone stockholders, and oftentimes both; and a dozen other combinations of local organizations interested in controversies of this kind.

"The Bell company has kept nine representatives in the field and has as a result of its year's work secured temporarily connections with seven small Independent companies, out of more than two hundred that they have solicited.

"The sub-licensing agents have misrepresented conditions in this State; they have misrepresented the purpose of this association; have misrepresented conditions in the adjoining States; and in fact have done everything they could to demoralize our business and build up theirs, and if this association had not been represented, in order to keep the facts in the case before the parties involved, I believe a great deal of harm would have been done.

"The association office has sent out circulars from time to time exposing the moves of the enemy and telling of the many defeats they have suffered at the hands of the Independents. The association office published a book of "General Information," showing the strength of the Independents as compared with the Bell, also giving many reasons why Independent companies should not connect with the Bell. The book also deals with the methods of handling the toll business through the Telephone Traffic Association. This book has been of considerable value in convincing the Independent companies that their combined strength is much greater than that of the enemy. And with the majority realizing their own strength we have been able to block the Bell at almost every turn.

"A year ago there were no Independent telephones in Nebraska that could talk to more than 35,000 Independent telephones. Those same telephones to-day can be used to talk to over 200,000 Independent instruments. This has been made possible through toll line extensions between Lincoln and Kansas City, and the building of a river crossing at South Omaha, which connects the Independent companies of Iowa and Nebraska.

"A great many toll line extensions have been made through the State. These extensions include an additional copper circuit between Lincoln and Seward; an additional copper circuit between Lincoln and Hastings; a direct copper circuit between Lincoln and Beatrice; a direct copper circuit to South Omaha from Falls City, via Auburn, Nebraska City and Plattsmouth; an additional copper circuit from South Omaha to Lincoln; a direct copper circuit has been completed from Kearney to Hastings via Kenesaw and the Kearney Telephone Company has constructed a copper circuit 60 miles north and west from Kearney, via Elm Creek, Overton and Sumner. This makes a total of 533 miles of No. 10 copper toll circuits that have been constructed this year.

"The association has grown during the past 12 months from 14,000 units to 24,000 units. The territory that our work is confined to has 48,000 Independent telephones as against 14,000 Bell; 210 Independent exchanges as against 39 Bell. The association has given a great deal of time to furthering the use of the National emblem, the Shield.

"We now have a State directory of Independent telephone users. We expect that this book will demonstrate to the general public the fact that there is a thoroughly efficient Independent toll line system in Nebraska, and also that the Independent telephone companies have won their fight against the Trust.

"The State has been divided into five districts. Most of the districts have held two meetings during the year and have found that a great deal of good is done by having meetings where purely local matters are discussed. A great many operating and traffic difficulties arise between neighboring companies that never come up between the companies located some distance apart.

"The district organization is particularly strong in keeping all these local matters straight. We are able to get a better representation of the territory at a district meeting than we can at a State meeting, and inasmuch as we must reach every one, we again see the advantage of this district organization. In each district there are three or four lieutenants who report to the State secretary the movements of Bell representatives and all other information that may be for the good of the cause.

"The district organization of the State is made up as follows: District No. 1, Dr. J. H. Lyman, Hastings, president; Fred W. Ashton, Grand Island, vice president; E. C. Crewson, secretary and treasurer. Counties—Hall, Hamilton, Merrick, Clay, Adams, Kearney, Buffalo, Howard, Sherman, Custer, Lincoln, Dawson and northern half of Phelps.

"District No. 2: T. H. Pollock, Plattsmouth, president; C. W. Nunemaker, Tobias, vice president; R. E. Mattison, secretary and treasurer. Counties—Washington, Douglas, Saunders, Sarpy, Cass, Otoe, Lancaster, Seward, Saline, York and Fillmore.

"District No. 3: I. E. Montgomery, Bloomington, president; Sam Patterson, Arapahoe, vice president; T. L. Porter, Alme, secretary and treasurer. Counties—Nuckolls, Webster, Franklin, Harlan, Furnas, Red Willow, Gosper, Frontier, Hayes, Chase, Perkins and Dundy.

"District No. 4: C. J. Garlow, Columbus, president; I. Lightner, Monroe, vice president; J. J. Roberts, Bellwood, secretary and treasurer. Counties—Polk, Dodge, Colfax, Nance, Platte, Boone, Butler, Madison, Stanton, Antelope, Cuming and Burt.

"District No. 5: C. W. Bartlett, Fairbury, president; A. R. Morris, Blue Springs, vice president; C. W. Pool, Tecumseh, secretary and treasurer. Counties—Nemaha, Richardson, Johnson, Pawnee, Gage, Jefferson and Thayer.

"The fifth district has things very much its own way, for in this district the Independent companies operate 12,000 telephones, while the Bell operate only 2,30.

"In traveling over the State during the past year your secretary has visited 160 towns and has observed that many things are needed that would improve the service. Among the things that would improve the conditions are: Standard toll line equipment; standard toll line construction; standard operating rules; a disposition on the part of each local company to solicit the territory they occupy for subscribers and for long distance business. I have found in a great many towns that the business men have not been informed of the extent or quality of the Independent toll line service that can be had over their Independent telephones, but have continued to use the toll lines of our competitor.

"I have also found that a great deal of business is lost by the Independent companies not providing a booth in the hotels for the use of the traveling public, and in a great many towns no booth is provided at the exchange or any public place to accommodate those who wish to talk privately. In the same towns, and many others, no signs are displayed to inform the people that there is an Independent company in the town, or that they have toll line connections.

Digitized by Google

"It is also noticeable that Independent companies having a strong local organization are more successful and progressive than those organized on other plans. Our opponent recognizes the strength of strong locally organized companies, and you will find that such companies have been less hampered by attacks from the enemy."

President Woods appointed committees on constitution, legislation and resolutions, which reported later in the session. The financial report of Treasurer Mattison showed a balance in the treasury, and unpaid assessments of over $800, which he thought would be paid in shortly. The remainder of the Wednesday morning session was taken up with five-minute reports on roll call by individual companies. This part of the session was where the delegates got together and discussed their troubles and their ways of meeting them, and to those delegates who came to learn this part of the program was perhaps the most valuable of the whole session.

In the Wednesday afternoon session the roll call of companies was continued. During this session the convention was addressed by visiting telephone men from the adjoining State of Kansas, some of whose lines connect into the Nebraska system. President Nelson, of the Kansas State Association, spoke briefly on the progress of the Independents in his State, and invited the delegates to attend the Kansas State convention, to be held February 5. Other Kansas speakers were Messrs. White and Pearce, of Belleville, and Doherty, of Concordia. Mr. White's story of the attempts made by the Bell company to secure franchises and buy up companies in his territory threw light on the methods of the big competitor. He told of carloads of material shipped out to the small towns and left there, to bluff the local councils and commercial clubs; and also told how all those carloads were shipped back to the Bell headquarters within some months, a little the worse for the rain and weather, but undiminished by construction in the Independent territory.

Mr. Kinney, of Woodbine, Iowa, told of 2,500 Independent telephones in Harrison county, with eight or ten Bell instruments for company, and called attention to the Sioux City-Council Bluffs toll line, just being completed, which will greatly strengthen the Independents in his territory.

Two important papers read at the Wednesday afternoon session were the discussion by S. A. Hensley, superintendent of the Western Telephone Company (long distance), of Lincoln, on "Toll Line Construction," and the review of the year's progress by C. J. Garlow, of Columbus. Mr. Garlow, who has served on the State executive committee for the past year, and also acted as president of his district organization, of some 10,000 telephones, knows the inside of the telephone movement; and his pertinent comments on the improvements that should be taken up by the Nebraska Association received much attention. His statement that the magnitude of the connected system in the State demanded the permanent employment of a consulting engineer, to formulate standard plans of installation and toll line connection, was applauded by the delegates, as was his statement that the policy of the Independent companies must be to improve, to put themselves on an up-to-date footing, and to retain by superior service the advantage they had gained through the former slackness of the Bell rival.

On Wednesday evening the second annual banquet of the association was held at the Lindell Hotel. The song, "Good-bye, Blue Bell," to the popular tune Blue Bell, was repeated over and over with the chorus:

Good-bye, old Blue Bell,
Farewell to thee.
Good-bye to high rates and monopoly.
We've got our toll lines,
Switchboards as well;
We're going to down you sure, you old Blue Bell.

The program of toasts was as follows: W. S. Clapp, toastmaster. "Our State," H. M. Bushnell, editor Lincoln Trade Review. "How Prohibition Affects the Telephone Business," President Nelson, of the Kansas Association. "North of the Platte River," C. J. Garlow, Columbus, Neb. "The Man Who Has to be Shown," R. V. Montague, Missouri. "Our Nebraska Friends," G. A. Briggs, Elkhart, Ind. "The Men We Buy From," Frank E. McGillen, Chicago. "Advantages of Consolidation," F. M. Pearl, Hiawatha, Kan. Reading, "Soul of the Violin," E. E. Maggi, Lincoln.

One number not on the program which aroused much enthusiasm was the recitation, by request, of two poems by Oliver Wendell Holmes, "The Boys" and "The Horse Race." Col. George Lyon, of Nelson, himself one of "The Boys," made the hit of the evening with his contribution.

The Thursday session was devoted to completing the details of the large amount of business brought before the convention for action the first two days. An election of officers resulted in the unanimous re-election of officers who have served the association so well during the past year, as follows: F. H. Woods, Lincoln, president; W. S. Clapp, Kearney, vice president; R. E. Mattison, Lincoln, secretary and treasurer.

Executive Committee—F. H. Woods; C. J. Garlow, of Columbus; W. E. Bell, of York; T. H. Pollock, of Plattsmouth. There was one change made in the executive committee, T. H. Pollock, of Plattsmouth, being elected instead of T. E. Parmele,

WIRELESS TELEPHONY FOR BUSINESS.

CONTINUOUS and regular generation of electromagnetic waves susceptible to modification in correspondence with the characteristic variations of the sound waves produced by speech is the essential point wherein Professor Fessenden's method of wireless telephony promises to give results which will have a practical value. The invention of the high frequency alternating current dynamo gives to his system two exceedingly important advantages over other methods of producing the fundamental waves which carry the necessary energy between the transmitting and receiving stations. The first of these advantages is made apparent by the comparison of the results obtained since his invention of the high frequency dynamo with those given in his earlier experiments with resonant circuits having a spark gap for the generation of waves, as set forth in the article concluded upon another page of this issue. In some respects it strikingly suggests the historic step which brought to its practical state the "speaking telephone" as a distinct advance over the scientific toys which had been used for the transmission of musical tones over wires. The regularity of the electrical waves, and the fact that one merges into another without a distinct break, as seems to be inevitable in the other methods, gives to the transmission a perfection due to the absence of all disturbing noises.

The second advantage is that due to the fact that the amount of energy which can be generated, and controlled, by the methods described in the present article can undoubtedly be increased to a considerable degree beyond that developed in the experiments which have been made with the object of providing data for later practical uses. The limit cannot be foreseen with any degree of confidence at the present time, but it is believed that the increasing of the rapidity of rotation of the present machine to its limited speed, giving 100,000 cycles, will make it possible to increase the range of transmission considerably beyond that attained in the earlier experiments. The transmission during the recent tests was so clear as to make it evident that a distance sufficient for many thoroughly practical uses can even now be attained without further modifications even of detail. With the development of transmitters, relays and receivers to a state of efficiency greater than that at present attained will come further possibilities of extension of the distance over which speech may be transmitted by this method. The line of advance in the development of these controlling devices seems to have been determined with considerable precision, so that one may expect definite results.

As a scientific accomplishment this most recent invention has a certain quality of beauty which makes it the object of far more than ordinary interest. Those who have become familiar with the wave forms corresponding to spoken vowels by the examination of records made with the oscillograph know how complex a thing is the combination of waves corresponding to a word. The extraordinary sensitiveness of the instrument (*i. e.*, the telephone receiver) required for the proper reception of the electrical impulses due to speech as they are transmitted over a wire, and the great susceptibility of these waves to destruction by even slight disturbances, bear testimony to the extreme delicacy of these electrical word forms. That a man should be able to devise a means of sending out into space a quantity of radiant energy bearing characteristics at once so complex and so delicate, and gathering at a determined point this remarkable thing with its integrity unimpaired is wonderful. Then add to this that his invention makes it possible to re-transform this energy, not into the heat from which it originated, but into the sound which gave it its peculiar form, and one may begin to realize the tremendous range of possibilities open to an imaginative mind trained to scientific work.

The influence of a practical system of wireless telephony upon the method of conducting various classes of affairs appears to be open to wide development. Tending to hasten its introduction on a commercial scale in many localities, as soon as a system is ready for use, will be the fact that it will not interfere with, but on the contrary can be made to most effectively supplement the present wire lines. Especially in the simultaneous transmission of a single message to many destinations, and to replace submarine cables with their high cost and narrow limitations upon distance for effective transmission, does a thoroughly practical system of wireless telephony promise to be a valuable aid to progress.

IOWA'S EDUCATIONAL PLAN.

PUBLICITY for the success attained by Independent telephone companies throughout the country is to be given in a most efficient manner by the members of the Iowa State Association. As explained last week, there is now being prepared a lecture, to be given for the first time at the convention to be held in March at Sioux City.

The basis of this lecture is to be furnished by photographs of typical buildings owned by successful operating and manufacturing companies in all sections of the country. This plan has the double advantage of making an appeal to the eye of the observer in a fashion that he cannot fail to understand, and of furnishing visible testimony of a kind which cannot be contested. The accuracy of the product of a camera, unlike that of a column of figures, is beyond dispute.

The proposed plan gives so much promise of valuable results, and is being so vigorously pushed by those who are responsible for its success, that it will be eagerly watched from all quarters. It is fortunate that telephone companies outside of Iowa may not only observe the value of this plan, but share in its benefits by co-operating with its originators. All companies which own buildings of attractive appearance should lose no time in sending photographs to the chairman of the program committee of the Iowa State Association, whose address is given on page 78 of this issue.

THE NEBRASKA IDEA.

SUBSTANTIAL aid to its members is the key to the efforts of the Nebraska Independent Telephone Association. The work of the organization during the past year, the success of which is to a large degree accredited to the energy and ability of Secretary Mattison, has resulted in the placing in the hands of members of much information which aids them effectively in the conduct of their business. The compilation of statistics and other information, aid in fighting the efforts of the opposing company to extend the sub-license plan, the issuing of a State directory, and the vigorous pushing of Independent advertising constitute a most valuable record of accomplishment. Not only has real development of a substantial sort been accomplished as a result of the individual efforts of members of the organization, but their co-operation with the central organization has brought many benefits to all companies which could have been secured in no other way. The plans for the coming year promise to retain for the Nebraska association the enviable place it has, by its good work, attained among the leading Independent organizations of the country.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

BUILDING TO REMOTE PART OF TOWN.

Will you kindly advise through the columns of your journal on the following:

A duly incorporated company is operating in a town, the boundary of which is about six miles from the central office, the company having lines run throughout the town, and it is understood that its business is confined to said town, excepting its long distance connections; a party living off the main line, but on a regular highway in the town, desires a telephone, but the company holds that the prospects for other subscribers are too remote to warrant building to him at said company's expense; the subscriber agrees to all conditions of said company as to time of lease, etc., and cites other parts of the town where it has run its lines as far for a subscriber. Can this party compel said company to furnish him with a telephone and service, and if so, is there any penalty for refusal on the part of the company to serve him or delay in same? The distance is about one-half mile from the main line; the party is fully responsible for rental, etc. XX.

A TELEPHONE company is a common carrier of intelligence, and as such is bound to furnish its instruments to whomever applies for their use. Under this principle, your company, if it holds itself out to provide telephone service in the entire town, can be compelled by the prospective subscriber to furnish him with a telephone and service. It is held, however, that a telephone company is under no duty to furnish telephones outside the city limits where it holds itself out to do a telephone business only within the municipal boundaries, so if it advertised itself as doing a telephone business in part only of the town it could not be compelled to furnish instruments in any other parts. It may also discriminate between subscribers of different classes, but the classes must be arranged on general principles and must be well established. The company cannot arrange classes for the occasion.

There is no stated penalty for refusal on the part of the company to serve the subscriber or for delay on its part in serving him, but the subscriber would be entitled to collect damages for the company's neglect.

Crouch vs. Arnett, 79 Pacific, 1086.

STATUTE PROHIBITING TRANSFER OF FRANCHISE BY CORPORATIONS DOES NOT APPLY TO INDIVIDUALS.

THE Long Acre Electric Light and Power Company of New York applied to the Supreme Court for a writ of mandamus to compel the Consolidated Telegraph and Electric Subway Company to give the petitioner a place in its subway ducts for the placing of three electric conductors. The subway company had refused to let the other company have the place desired. The petitioning company had complied in all respects with the rules and regulations laid down in the Subway Act of 1887 for such applications, and fornished to the company and to the court documentary evidence showing its title to a franchise. The principal objection made by the defendent was that the petitioning company must first apply to the comissioners of water, gas and electricity before the application for space in the subway could be made, but the court held that such prior application was unnecessary.

Defendent also alleged that a franchise was not property and assignable as such. But the court held that the general policy of the State of New York was to render an interest by way of franchise independent of the life of the original corporation, and transferable as property. Another objection was that the consent of the gas commissioner to the assignment of the franchise from an individual to the Long Acre Company was not obtained. To support this objection, a statute which forbids a corporation transferring or leasing its franchise or other property to any other person or corporation was cited. This statute contained no prohibition of such transfer by an individual. The court therefor held that the transfer of the franchise was proper and granted the mandamus applied for. In re Long Acre Electric Light and Power Co., 101 N. Y. S. 360.

SAN FRANCISCO FRANCHISE VALID.

THE attempt of Hugo K. Asher to have the franchise granted the Home Telephone Company of San Francisco last April declared void has met with defeat in a decision favoring the company, rendered January 7 by Judge Kerrigan.

The judge's authority to render the decision was called in question by Asher's counsel, who contended that Kerrigan's term as superior judge had expired at midnight on the Sunday previous. Judge Kerrigan's decision was rendered on the ground that the correct remedy for the plaintiff was not through a suit for an injunction, which was the purpose of the action at bar.

The suit to test the validity of the franchise was based on the conditions existing immediately subsequent to April 18, 1906. The receipt of bids for the franchise was set by the board of supervisors for April 23 and the bid of the Home Telephone Company was received at that time. On June 9, Dr. Butterfield filed a bid that was higher than that on which the franchise was awarded, but Asher asserted that this did not affect Butterfield's rights, as the days intervening between April 18 and June 9 were declared legal holidays by Governor Pardee. This contention was not regarded as decisive by the court.

ABUTTING OWNER MAY NOT ENJOIN BUILDING OF LINE IN ALABAMA.

THE Long Distance Telephone and Telegraph Company of Alabama, while engaged in the construction of its line, was restrained by injunction sued out in the Limestone County Court of Alabama from proceeding with its work. The complainant, an abutting owner, demanded compensation for damages to his lands before he would permit the work of continue. The company answered that it was constructing its line along the margin of a public highway which runs through complainant's land, and showed that all the damage that would be done was the cutting of six trees and a little underbrush of no particular value. The court held that a telephone line constructed along the margin of a highway is not an additional burden entitling the abutting owner to compensation. The court based this decision upon section 2490 of the Alabama Code of 1898, which gives the right to telephone and telegraph companies to construct their lines "along the margin of the public highway." It was, therefore, right for the company to cut these trees, since the municipal corporation which controlled the highway would have had the right to cut trees and might lawfully delegate that right.

Hobbs vs. Long Distance Telephone and Telegraph Co., 41 S., 1003.

IN THE OPERATING FIELD

TOLL LINE IMPROVEMENTS IN NEBRASKA UNITE MANY IMPORTANT CITIES.

A NEW copper toll line, which taps many important Nebraska cities and towns, is expected to be completed and in service within a few days. This line has been built by the co-operative efforts of a number of companies, each of which has built a section. The completion of this work united a large number of cities in this region, which, although operating well developed local systems, have been somewhat handicapped in the matter of connection over toll lines. The present line gives Nebraska cities a new wire, over which connections may be had with Atchison, Lawrence and Kansas City on the southwest, and Council Bluffs, Des Moines, Sioux City and other towns in the east. The line, among other places, taps Hastings, Lowell, Lincoln, Kearney and Kenesaw.

INDEPENDENT LINES ADVANCING IN TENNESSEE.

ALTHOUGH unable at present to operate exchanges in Nashville, Tenn., owing to delays incident to litigation brought on by the Bell company for the purpose of hindering the Independents, much work is being done along the main line of the Home Telephone Company, which extends through the State. A line from Louisville has been extended into Nashville, and the Home Telegraph Company is now operating a long distance toll office there. Injunctions and other court troubles brought about by the Cumberland Telephone and Telegraph Company (Bell) have prevented extensive work in Nashville so far, but the company is said to have erected about 500 poles along a number of principal streets. From the south line of the city the poles reach several miles. When the gap between Nashville and Columbia, forty miles, is filled, the Independent company will have a through line from Louisville to Birmingham, Ala., where the Independent company has a flourishing business, the largest exchange in the city.

At Columbia, Tenn., The People's Telephone Company has a flourishing business and a toll line to Berham, which will connect with the Home company's trunk line. F. F. Ruggles, superintendent of construction for the Home company, has carried his line south from Columbia, Tenn., to the Tennessee River at Decatur, Ala., where he has just laid a submarine cable under the river. Within a few weeks he will have the line completed from Columbia to Birmingham. In Decatur the Independent people now have a modern exchange with a good list and another at Cullman, Ala. When the trunk line is completed, however, several other local exchanges will be put in. The trunk line is being built of chestnut poles, carrying three lines of Nos. 10, 8 and 6 copper wire respectively.

BATTLESHIPS IN CHARLESTOWN NAVY YARD INSTALL TELEPHONE PAY STATIONS.

TELEPHONE systems on shipboard, both upon passenger liners and battleships, are now very commonly installed. It has even been no unusual thing for a long time past to run a temporary connection to a vessel during its stay in port. An advance along this line seems to be recorded in a recent report from the United States navy yard at Charlestown, Mass., where it is said that at present there are five large battleships undergoing repairs. Each of these has had installed near the officers' quarters a telephone booth, from which connections may be had directly with the central exchange in the city of Charlestown, and all points reached by toll lines.

NO PROSPECT OF BELL COMPANY ACQUIRING INDEPENDENT EXCHANGE AT ELKHART, IND.

ALTHOUGH repeatedly during the past year reports have been circulated by persons connected with the Bell interests, who wished to injure the business of the Home Telephone Company of Elkhart, Ind., that the latter company was to be absorbed by the trust, at a recent meeting of the officers of the company it was emphatically stated that no such arrangement will be made.

Owing to the favorable reports which were made of the com-

Delegates and Guests at the Recent Convention of the Vermont and New Hampshire Independent ***Telephone Association.***

IN THE OPERATING FIELD

pany's progress, it was decided to make important improvements in the system during the coming year. New exchange equipment is to be installed at Goshen and the plant will be brought up to date in the best possible manner.

At the Elkhart exchange work will soon be begun on the erection of 5,000 feet of cable, which will improve distribution in the business district.

The company is now operating nineteen exchanges, of which the largest is at Elkhart, with 1,780 telephones connected, and the next in size is at Goshen, with 1,010 telephones. There are 5,000 Independent telephones in Elkhart county.

Forty-eight girls are now employed in operating and accounting departments, and fifteen men work for the company. The stock is divided among no less than one hundred and nineteen holders, the most of whom are residents of the territory in which it operates. At a recent meeting the following officers were elected: Dr. I. W. Short, president; J. A. Arthur, vice-president; W. L. Shoots, secretary and general manager, and with these, P. R. Judkins, W. C. Peters, of Goshen; J. B. Pollard, E. D. Ziesel and Wilson Roose, of Elkhart, constitute the board of directors.

IOWA CONVENTION TO BE HELD AT SIOUX CITY, MARCH 19, 20, 21, 1907.

THE convention of the Iowa Independent Telephone Association is to be held at Sioux City, Ia., on March 19, 20 and 21. At this convention will be presented for the first time an illustrated lecture which is being prepared by the members of the association. Telephone companies have been invited to cooperate with the association in the preparation of this lecture by sending photographs of buildings, etc., to C. H. Smith, chairman of the Program Committee, care New State Telephone Company, Sioux City, Ia. This address and the place of the convention are correct, superseding the erroneous statement which appeared in our issue of last week.

Important matters of operation and development are to be discussed, and reduced railway rates have been secured, so that a large attendance is assured.

WINNING PROVIDENCE FOR THE INDEPENDENTS.

(*Continued from page 71.*)

of the advantages of an Independent telephone system, that the council chamber and galleries were filled with citizens to overflowing, the large entrance doors having to be opened so that the hundreds of anxious citizens who could not gain admittance to hear the proceedings stood in the entrance corridors and halls. A great many ladies were present, which lent color to the audience. Prominent business men were there to judge for themselves the merits of telephone competition. In th audience could be seen a great many men of national importance and reputation.

The cases were presented by Judge Lee, of Providence, the company's attorney, assisted by Mr. Charles E. Sumner, of Toledo; Judge Albert R. Smith, of Buffalo; Hon. H. Hendrickson, of Albany; R. Maxwell Eaton, secretary of the New York State Independent Telephone Association, and Ray H. Manson, expert engineer from the Dean Electric Company, of Elyria, O.

Representatives of the Bell telephone company were there in large numbers. The case was opened by Judge Lee, of Providence, who recited the history of the telephone movement and made known the personnel of the directorate of the Home company, which had been kept a secret up to that time. He announced that the directors and officers of the company are: Dr. Clarence T. Gardner, of Providence; Howard Hendrickson, of Albany, N. Y.; Theodore M. Brush, of Elyria, O.; William Penn Mather, of Providence; Arthur W. Dennis, of Providence; Bertrand J. Horton, of Providence, and Thomas Z. Lee, of Providence. The officers are: President, Thomas Z Lee, of Providence; vice president, Dr. Clarence T. Gardner, of Providence; secretary and treasurer, Theodore M. Brush, of Elyria, O. When these names became known, applause greeted the public knowledge of their identity, showing that the citizens of Providence appreciated the men of worth who are back of the enterprise.

A demonstration of telephone equipment and apparatus was made in the Council Chamber by Mr. Manson. As throughout New England Independent telephone matters are comparatively undeveloped, it was thought advisable to show the superior character of the product of a modern Independent factory.

The principal speaker of the first evening was R. M. Eaton of Niagara Falls. His address, in which he keenly criticized the weak points of the service and rates of his opponents, and set forth the advantages to be derived from the admission of his company, was comprehensive and eloquent. The following is the list of pertinent points gleaned from Mr. Eaton's presentation of the case:

"The housewife having the $25 service of one and one-half calls per day, may call the baker in the morning for her bread, but will have to go without meat for dinner, as she has only a half call left.

"Figure the rates of the Providence Telephone Company per line, rather than per subscriber, and see what it means.

"What is the use of having a telephone for ornament? The quantity of the service you can secure is the value of the instrument.

"A number of people in Providence who have expressed themselves as averse to two telephones, already have two or more telephones in their establishments, and have forgotten all about that. The granting of a franchise does not compel a subscriber to have two telephones.

In no city of the United States where telephone competition exists, has the Bell telephone service depreciated in numbers or quality, consequently the subscriber who takes advantage only of the present service is tremendously benefited in three ways—by increased service, reduction in rates and better treatment.

"Business men, don't take the dual service unless you want it. You will be getting ahead of the game by letting it come in, anyway, if you even only stick to the system you have.

"Over 80 per cent. of the residences in Providence are yet without telephone service; how do you account for it, and what are you going to do about it?

"Some business men stated that they did not want two telephones; this would seem to coincide with the argument that they don't want two customers to come in at the same time—they might have to hire additional clerks.

"One large establishment stated that it did not want two telephones, as it might have to hire an additional girl to take orders over the new line: narrow minded, isn't it?

"Some people have said, 'Give us a franchise, but make us pay to the city abnormal sums for it.' Be fair. Give us a franchise under equal conditions and equal restrictions with the opposition. If you will have a race and benefit by it, place no handicap on either of the contestants; it is un-American.

"Don't imagine that the city of Providence will be torn up for underground work to give you a parallel of previous experience. Construction work is not done now with a stick of dynamite in one hand and a red flag in the other. No street in Providence with heavy traffic will be opened during the daytime; work will be done at night and closed in by morning. You will not know your streets have been opened. Not one-third of the streets of the city are required to be used for telephone distribution. Pole lines will not be constructed as now exist on the sides of your best streets, or few other streets, for that matter. Alleys and private rights of way will be used.

"It has been stated that there is no room in the streets for additional ducts. The streets may not be very wide, but they are 4,000 miles deep. Nothing else could be put in Broadway, New York, but when they got around to it, they constructed a subway there four tracks wide, through which passenger cars are running. That was the limit, but when they wanted to, the Pennsylvania Railroad went underneath that with another big tunnel.

"You need competition; we are willing and ready to give it to you.

"There are ills in the telephone business to be remedied that will never be remedied in any other way but by competition.

"Providence, a manufacturing city, cannot afford to exclude herself from the great markets of the West, and the majority of telephone users of this country. Toll line service will be connected with Providence as far west as Kansas City, and south to the Gulf.

Digitized by Google

Providence should have 25,000 telephone subscribers, instead of between 11,000 and 12,000 as it now has, liberally estimated.

"About two telephone books—it is better to look in two books and find who you want to talk to, than it is to look in one book, and then send a messenger boy.

The advantages of competition, as shown by the improvement in conditions in very many parts of the country, were set forth by various prominent telephone men. Among them were Charles E. Summer, who told of conditions in Toledo, O., Portland, Ore., Spokane, Wash., and other places. Hon. Howard Hendrickson, of Albany, and Judge Albert R. Smith, of Buffalo, told of the advantages of Independent service in their localities. Other favorable statements were made by Vinton A. Sears, of Boston; Judge Edward C. Dubois, of the Supreme Court of Rhode Island, and other prominent men.

Three hearings were given to the Providence Telephone Company on the afternoons of January 28, 29 and 30. Although these hearings were held too late for us to report in detail their effect, it was evident that the standing of the men behind the Home Company, the strength of the facts they presented, and the evident sincerity of their intentions to give to Providence an improved telephone service at lower rates, convinced the people of the city that it is to their interest to have a competing telephone system. It is expected on all sides that the council will not delay in carrying out the wishes which have been so generally expressed in public, that a franchise should be at once granted to the Home company.

THE NEBRASKA INDEPENDENT TELEPHONE CONVENTION.

(*Continued from page 74.*)

of the same city. Mr. Pollock and Mr. Parmele are business partners and the change was made for their convenience.

During this session L. E. Hurtz, manager of the Lincoln Telephone Company, read a technical paper on the charging of storage batteries from an alternating current source which attracted wide attention and brought out much favorable comment on the thorough manner in which the subject was covered.

An able paper was read by G. E. Becker, of Pawnee City, on "The Position of Telephone Companies Before the Law." His article was a comprehensive discussion, taking up the various troubles that meet the right-of-way man, and the other difficulties apt to arise between the telephone company and the public.

The important work of adopting a revised constitution, drawn so as to cover the enlarged size and scope of the association, occupied most of this day's session. The Telephone Traffic Association, which handles the clearings of toll service for the Nebraska companies, held its annual meeting and re-elected the former officers. The report by Secretary Mattison announced that negotiations were being completed to extend the Traffic Company's work so as to handle clearings on interstate business between Nebraska and adjoining States.

General commendation was expressed, in the talk of the delegates and in the speeches made on the convention floor, at the work of the secretary, R. E. Mattison. Mr. Mattison has manifested the happy faculty of being a good general, a good lawyer, a good debater, a good fighter if necessary, and the remarkable progress of the association during the last year is ascribed in a considerable measure to his efforts.

The net results of the convention are best summarized in the plans determined on by the newly elected executive committee, in a meeting held immediately after the convention. The committee issued the following statement:

"The Telephone Association, through its executive committee, will proceed as soon as possible to put into effect the important reforms recommended by the convention. Our association has reached a magnitude that makes it necessary for its component companies to adopt a permanent policy of giving a service so excellent that it will continue to hold the good-will of the telephone-using public, which it now possesses.

"The improvements we will inaugurate are as follows:

"The secretary of the association will issue a regular monthly bulletin, containing information on the telephone movement in this State. The first bulletin will appear March 1.

"The association will issue specification for standard toll line construction and standard toll line equipment. These specifications will be prepared from the best telephone authorities, adapted to local Nebraska conditions, and will be fully illustrated with cuts and diagrams showing the best methods of meeting the various problems of construction and connection. By the adoption of this standard the few ragged ends of our long distance service, which now compares with the best in the country, except in a few cases, will be brought together, and we will compete in toll service as effectively as we already have in local service.

"The Telephone Traffic Association will at once complete the work of preparing a routing book and rate sheet, and will employ extra help to expedite the work.

"The affairs of the association are in excellent condition. The method of assessing members of the association on a basis of ten cents per unit has proved very satisfactory, and the association has ordered it continued another year."

Many well-known manufacturers and supply houses were represented at the convention, and the following is a list of such companies which took out honorary membership in the association, through their representatives at the convention, whose names are given:

Western Electrical Company, Omaha, Fred G. Balz; The North Electric Company, Cleveland, O., A. A. Miller, E. M. Scearce, Albert Korst; Backus-Judd Lumber & Cooperage Company, Minneapolis, Geo. J. Backus; Electric Appliance Company, Chicago, E. V. Brown; Illinois Electric Company, Chicago, C. MacIntyre; Joseph R. Lehmer, Omaha, W. E. Crist, W. E. McFadden; Frank B. Cook Company, Chicago; F. A. Rader; Western Electrical Company, Omaha, Frank D. Lowry; American Steel & Wire Company, Chicago, G. E. Quigley; Columbia Electrical Company, St. Joseph Mo., T. O. Strong; Sterling Electric Company, Lafayette, Ind., C. R. Brown; Valentine-Clark Company, Chicago, T. L. McGillan; Dean Electric Company, Elyria, O., Fred Coulson, W. S. Williams, T. H. Halstead; Swedish American Telephone Company, Chicago, Ill., F. M. Ferguson; Stromburg-Carlson Telephone Manufacturing Company, D. C. Gould, Omaha; Electric Appliance Company, Chicago, R. S. Mitten; Colman J. Mullin, Brooklyn, N. Y.; L. K. Deal, representing L. K. Deal Lumber Company, Des Moines, Ia.; Nebraska Electric Company, Omaha, represented by A. G. Munro, secretary, and J. F. Munro; A. J. Carter, Sioux City, Iowa, representing Monarch Telephone Manufacturing Company, Chicago; Vote-Berger Company, represented by P. W. Goodman, Northwestern representative, and R. C. Fields, Nebraska representative; E. L. Larabee, Nebraska representative Eureka Electric Company, Genoa, Ill., W. H. Messenger, secretary Eureka Electric Company; George W. Brown, Elkhart, Indiana; Geo. A. Briggs, Elkhart, Ind.; W. J. Crawford, Chicago.

EXPERIMENTS AND RESULTS IN WIRELESS TELEPHONY.

TELEPHONE SYSTEMATIZING DEPT.

5 and 7 PEARL STREET (EAST), GRAND RAPIDS, MICH., U. S. A.

Digitized by Google

former is used in the receiving circuit, Fig. 15. The receiver and battery are connected across the terminals of the barretter in the manner indicated, a simple potentiometer arrangement being used to regulate the normal voltage at the receiver terminals. Inductances, not shown in these diagrams, were inserted between the aerial and the transformer winding for the purpose of tuning.

With this arrangement of apparatus speech was clearly transmitted from Brant Rock to Plymouth by some of the men present at the tests made on December 21. These tests also included experiments in transmission from a phonograph and nearly all speech, as well as music was distinctly intelligible. All tests made were apparently satisfactory. Articulation was distinct, the quality of reproduced tones good, and the efficiency of transmission was high. An expert stated that he believed the efficiency to be on that day rather better than transmission through twenty-five miles of standard cable, this judgment being, of course, based on his estimation unassisted by any of the devices for comparison which are available in laboratories for transmission testing. A modification of the circuit which is shown in Fig 12 is effected by the introduction of a telephone relay as indicated in Figure 14. For this purpose Professor Fessenden has designed a highly ingenious type of relay, using

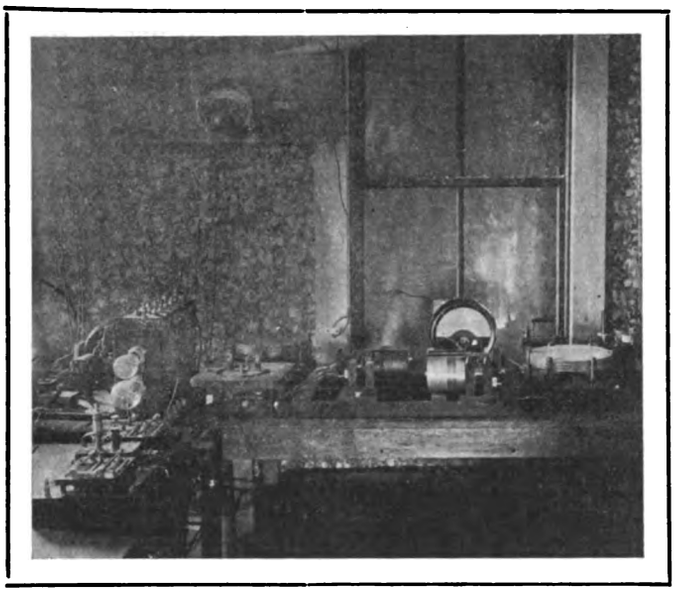

Fig. 13. View of transformers, condensers, etc., at a receiving station.

differential windings on the cores of magnets, between the poles of which is mounted an armature attached to the electrode of a microphonic transmitter chamber. Variation in the current traversing the windings causes a shifting of the magnetic field to one side or the other, producing a corresponding series of changes in the position of the plate controlling the movable transmitter electrode. This relay has shown itself to be very sensitive in practice, but improvements made within the past few weeks are expected to materially improve its efficiency. As a call a double differential relay of this type has been used to operate either a loud-speaking transmitter, a bell or a Morse writer.

In the system shown it is necessary, as in the early Bell telephone system, to throw a switch to change from talking to listening. At the tests a method of overcoming this defect was explained. Although patent considerations prevent the publication of the method of accomplishing this at the present time, it has been in successful operation. In general, Professor Fessenden has found that where no spark is used for transmitting and a carbon transmitter is used for modifying the strength of waves the speech is as distinct as over a short open wire line, rather more distinct than over cables, owing to the absence of any capacity effect, and there is a total absence of extraneous noise. With the present methods of transmission, there appears to be no distortion of sounds with increase of distance, as is found in all wire lines. Although this might have been anticipated, it has been experimentally demonstrated by comparison of the relative intensities of notes of different frequencies at different distances. These characteristics have led to the prediction that wireless telephony may operate over longer

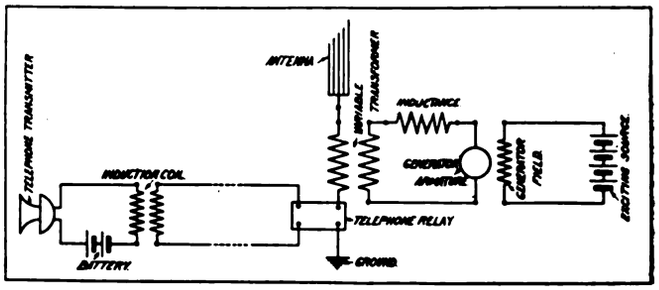

Fig. 14. Arrangement of transmitting circuit with telephone relay between transmitter and aerial.

distances than is possible with wire lines. The difficult problem in increasing the range of transmission is at present the modulation of the large amount of energy given out by the antenna. Where an ordinary granular carbon transmitter is used about one-half ampere of current is all that can successfully be modulated, and even with special transmitter buttons 2½ amperes seems to be about the limit. With multiple buttons the limit is reached at about 10 amperes. For currents larger than ten amperes a number of telephone relays may be placed in series and operated by a single transmitter. The practical limits for this method have not as yet been determined. Much depends upon the possible improvements in the efficiency of the relays.

Possible uses of wireless telephony cover a variety of important fields. At sea the wireless telephone may be used as a safeguard in foggy weather. On land it is doubtful if wireless transmission will ever supplant the local exchanges with wires. So far as the subscriber is concerned, the simplicity of present systems is an advantage which is not likely to be overcome. For trunking, however, it apparently has a field, owing to its comparatively low first cost, faculty of working multiplex for the transmission of several conversations simultaneously by methods which are now being developed, and to its lack of susceptibility to the foreign influences which produce disagreeable noises in open wire lines. Its ultimate adaptability to long distance transmission and its comparative low cost is a factor which should not be overlooked. For supplanting submarine cables the system has an obvious advantage in transmission, owing to the absence of capacity effects. A practical application along this line which has been suggested is the use of the wireless system for transmitting speech across the English Channel. It is admirably adapted to the transmission of news, music, etc., as, owing to the fact that no wires are needed, simultaneous transmission to many subscribers can be effected as easily as to a few.

Methods of automatic relaying from ordinary telephone lines to wireless transmitting lines and from a wireless receiving station to a wire line are obviously simple and have already been tested with success. On sea and on land wireless telephony

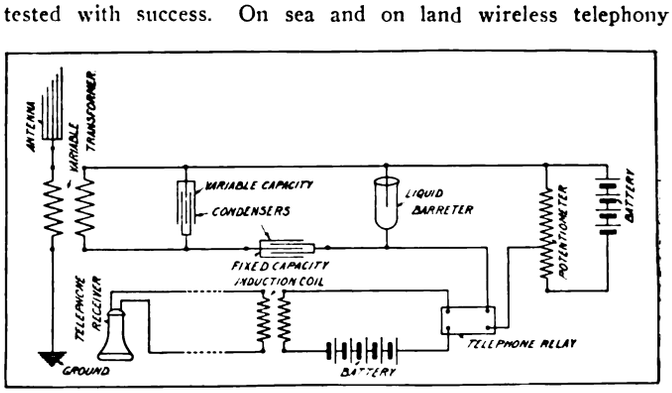

Fig. 15. Arrangement of receiving circuit using telephone relay. The circuit used in the tests on Dec. 21st was similar except that the telephone receiver was connected directly in circuit without a relay.

has the immense advantage over telegraphy that no expert operator is required either for transmission or for sending.

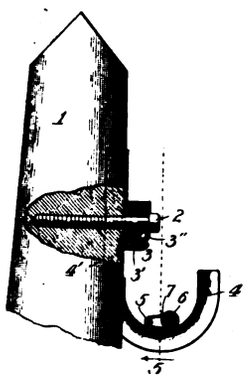
TELEPHONE PATENTS

APPARATUS FOR ERECTING AERIAL CABLES.

Ralph S. Peirce, Chicago, Ill., patents (No. 840,009; dated Jan. 1, 1907; filed Feb. 27, 1905; serial No. 247,491) an apparatus for erecting aerial cables.

The object of this invention is to provide a type of hanger for temporary use in the stringing of cables which shall make it unnecessary to employ a man at each pole to pass hooks by the messenger support.

The device consists of a curved plate of sheet steel as shown



at 4, forming a hook. The portion of this hook which is secured to the pole is curved to conform with the circumference of the pole to give it a considerable amount of bearing surface, while the hook portion is curved to allow the cable and messenger wire to lie freely within it and to be supported by it. Lateral edges of this portion of the device are curved downwardly so that, when the cable is being drawn along, there will be no chance for it to catch. After the cable has been pulled into place, it may be supported temporarily at each pole by a suitable lashing of rope and the shoe removed, after which the messenger-wire may be secured in its proper place on the permanent support. In a modified form, a slot in the hook 4 is provided by means of which it may be withdrawn from the lag-bolt 2 by lifting slightly and moving it sidewise. After this the lag-bolt 2 may be tightened in the usual manner on the messenger hanger and the cable left permanently supported.

TELEPHONE SYSTEM.

Alfred H. Dyson, Chicago, Ill., patents (No. 830,981; dated September 11, 1906; filed April 17, 1905; serial No. 256,063) and assigns to Milo G. Kellogg, Chicago, Ill., a telephone system.

This invention covers apparatus and circuits for giving a substation means for simultaneously connecting to all the lines of a plurality of other sub-stations, and ringing bells at and communicating with persons at these stations. It is accomplished by the provision of a special service circuit at the exchange and a relay for each line, associated with this special service circuit. Special apparatus at the exchange is adapted to operate the relays and to switch all the lines into a common conversational circuit. The details are worked out with reference to an automatic system.

AUTOMATIC DISCONNECTING PLUG.

Isidor Kitsee, Philadelphia, Pa., patents (No. 838,787; dated December 18, 1906; filed June 8, 1901; serial No. 63,749) a self-withdrawing switchboard plug.

This patent covers a device consisting of a rather complicated aggregation of pieces of insulation, iron, coils, special circuits, etc., etc., the object being to provide a switchboard plug which will automatically fall out of a specially constructed jack when a subscriber breaks the continuity of a line circuit at his telephone.

COMBINED TELEPHONE AND DISTRICT MESSENGER SYSTEM.

James G. Nolen, Chicago, Ill., patents (No. 838,136, dated Dec. 11, 1906; filed Nov. 26, 1902; serial No. 132,856) a combined telephone and district messenger system.

An arrangement of circuits and apparatus designed to make it possible to send a messenger call over a telephone line is described.

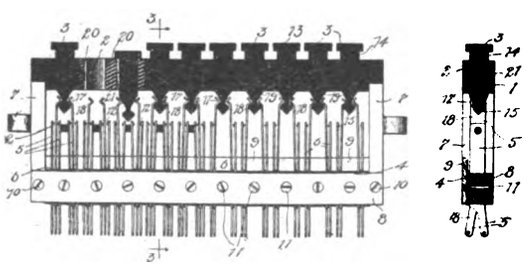
A call-box, containing an interrupter, is bridged across the telephone line at the sub-station. The operation of the interrupter causes the line signal to be intermittently disclosed and withdrawn at the central office, indicating the special nature of the call. To show that the operator has recognized the call and forwarded it to its proper destination she is provided with a means for operating the indicator in the face of the messenger call-box through an electromagnetic mechanism having a grounded neutral point, located within the call-box.

SWITCHING DEVICE.

William Kaisling, Chicago, Ill., patents (No. 840,699; dated Jan. 8, 1907; filed Nov. 23, 1903; serial No. 182,392) and assigns to The Stromberg-Carlson Tel. Mfg. Co., Rochester, New York, a switching device.

This invention consists of a plate of insulating material provided with openings through which pass the actuating-buttons 3 3. A lower bar, 4, supports switch springs 5 5, set in slots 6 6.

Contact buttons have V-shaped indentations 16, cut into opposite sides to be engaged by V-shaped indentations 17, at the ends of actuating switch-springs 18 18. This structure causes springs 18 to be forced apart to engage other switch springs when the button is depressed. The extended locking portion, 15, of each button is so disposed below indentations 17 as to prevent the buttons from leaving their openings when sud-



denly snapped back to the inoperative position. To prevent the buttons from turning and to maintain the faces 19 19 parallel with the switch springs, a keyway 20 is provided in the walls of each of the openings 2, and this is engaged by a key 21 on the actuating button. The entire combination provides a key in which the springs are so disposed that they extend transversely of the frame, so that all points are fully in view, and adjustable from either side, and in which the actuating buttons are readily removable from their openings and are interchangeable.

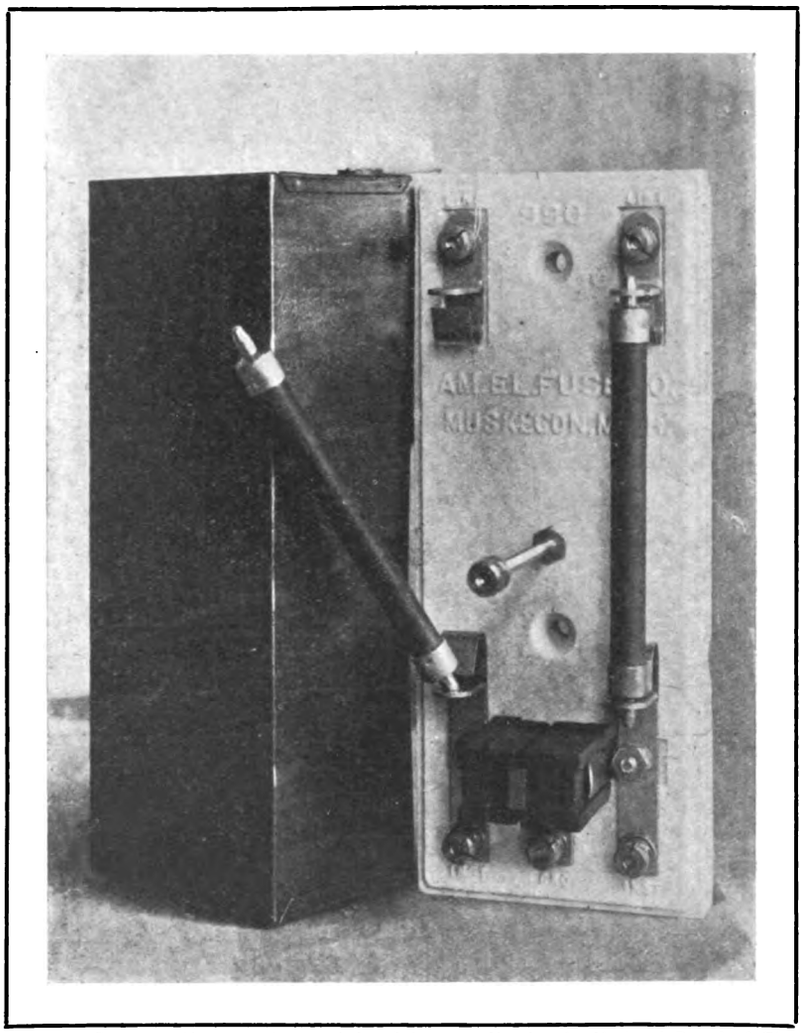
IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

AN APPROVED SUB-STATION PROTECTOR.

THE use of approved protective appliances at sub-stations is not only one of the most effective means of safeguarding the persons and property of subscribers, but provides for a telephone company immunity from damages in most cases of actual injury. In order that its customers may fully protect themselves in cases of the accidental communication to their circuits of high tension currents, the American Electric Fuse Company, Muskegon, Mich., has produced a number of new individual station protectors that have been fully approved and listed by the National Board of Fire Underwriters.

The appearance of one of these, the No. 990 protector, is indicated by the illustration which appears in the centre of this page. This protector embodies in its construction a number of especially good points, from both theoretical and practical standpoints of operation and maintenance. All of the protective apparatus is mounted upon a raised porcelain block about three-quarters inch thick, making a substantial base which will not warp. The mountings are of extra heavy brass, to insure their remaining permanently in position. These are so arranged as to form a thoroughly positive connection for the fuse, and yet to permit its removal or the placing of a new fuse almost instantly, without the use of tools. The binding posts will take any ordinary size of wire. The slotted thumb nuts make it easy to handle them with the fingers, and make a final turn with a screwdriver if necessary. The operating parts of the protector include carbons with extra large surfaces, and a fibre covering for the fuse wire, which is lined with asbestos braid, making fire impossible.



American Protector No. 990, Approved for Substation Use by the National Board of Fire Underwriters.

The front of the protector is covered by a metal case, held in place by a single thumb screw on a pin projecting through an opening in the middle of its front surface. This case is firmly put together, and the fibre bushings for the entering wires are firmly set in place. The entire instrument is constructed in a thoroughly reliable and substantial manner. The company has prepared a new catalogue in which are full descriptions of this protector and other apparatus for use at sub-stations, cable terminals, etc. This book may be obtained upon request.

THE VOTE-BERGER COMPANY, La Crosse, Wis., is extending the applications of the iron wire ballast principle to telephone circuits in a number of very interesting ways. For some time past, wherever it has been exhibited, and especially during the recent Electrical Show at the Coliseum in Chicago, the company's switchboards embodying this principle have attracted very much attention. At the Electrical Show there was exhibited a section of multiple common battery switchboard in which the signals were controlled by iron wire ballast without the use of relays. This exhibit was a constant center of attraction to telephone men, and won favorable comment from engineers.

So general has become the interest on the part of those who wish to obtain accurate and reliable information concerning the theory and practical application of this iron wire ballast principle that the company has made arrangements to have its Engineering Department handle correspondence of this nature. Those who make inquiries may thus be sure of obtaining full and accurate information. Letters of this character should be addressed to *Department B*, The Vote-Berger Company, La Crosse, Wis.

This company, in addition to the success achieved with its iron wire ballasted circuits, is finding an extended market for its V-B express switchboard, the V-B ringer, the pendant telephone, D. & T. anchor and its other lines of telephone apparatus.

W. C. STERLING & Co., of Monroe, Mich., have been awarded a contract for supplying the Home Telephone Company of Detroit, Mich., with 5,000 poles.

LOUIS M. PIGNOLET, 78 Cortlandt street, New York City, reports that the use of his voltmeters and volt-ammeters by small telephone companies is rapidly increasing. It was formerly the custom to determine the nature of the trouble by a rough test with a magneto, and then send a man to look for it along a whole line; at the present time, however, the economy of the plan of finding out in advance just where the trouble is to be found has been recognized. There are also many tests which can be advantageously made in the work room. Full information concerning these instruments may be obtained by writing to the manufacturer.

THE WEEK'S MESSAGES

NEW COMPANIES.

IGO, CAL.—The South Fork Telephone Company has been organized, and has already constructed part of its system. Millard Hubbard is one of the organizers of the company.

GALATIA, ILL.—The Galatia Independent Telephone Company has been incorporated with a capital stock of $1,056. Among the incorporators are S. D. Lockwood, C. E. Robinson and Noah Reynolds.

MARSHALL, ILL.—The small mutual telephone companies in Marshall and vicinity are to be incorporated under the name of the Farmers' Mutual Telephone Company of Clark County, having refused offers of connection with the Bell Company.

PLEASANT HILL, ILL.—Articles of incorporation have been filed by the Farmers' Mutual Telephone Company of Pike County. It has an authorized capital stock of $2,500, and the incorporators are F. D. Roberts, B. A. Galloway and W. S. Freeman.

ROBINSON, ILL.—The Southeastern Illinois Long Distance Telephone & Telegraph Company, of Robinson, has been incorporated with a capital stock of $2,500. It will construct and maintain telephone and telegraph systems, and among those interested are W. M. Long, F. W. Lewis and C. R. Harris.

SALEM, IND.—Articles of incorporation have been filed by the Mill Creek Telephone Company. It will construct, equip and operate a telephone system in Washington County, and Louis C. Carter has been made president.

COUNCIL HILL, IND. TER.—The Council Hill Telephone Company has been incorporated with a capital stock of $2,500, and the following officers have been elected: H. E. Bell, president; J. R. Head, vice president; Adam Pence, treasurer; H. M. Sappington, secretary.

LAKE ANN, MICH.—A new Independent telephone company, to be known as the Lake Ann and Oviatt Telephone Company, has been organized at Oviatt. It is the company's intention to build a line between Lake Ann and Oviatt, with branches in many other directions.

ENDEE, N. M.—Articles of incorporation have been filed by the Endee-Tucumcari Farmers' Mutual Telephone Company. The company has an authorized capital stock of $10,000, divided into two hundred and fifty shares of the par value of $40 each, and its principal place of business will be located at Endee. Among the incorporators are R. E. Dever, E. E. Hedgecoke, William Wharton, C. L. Fallwell and J. M. Hedgecoke, all of Endee.

LEWBEACH, N. Y.—An Independent telephone company is being formed by the business men of Lewbeach for the purpose of constructing lines between this city and Livingston Manor, Hardenburgh and other points.

COOPERTON, OKLA.—Articles of incorporation have been filed by the New State Telephone Company of Cooperton. The capital stock is placed at $25,000, and among the incorporators are W. S. Ainsworth, F. King, B. M. Rogers and E. V. Kakestraw, of Gotebo; W .R. McKee, John Funk and L. L. Case, of Cooperton.

EARLSBORO, OKLA.—The Farmers' Telephone Company, of Earlsboro, has been incorporated with a capital stock of $5,000, and the following officers elected: P. H. Downing, president; James Turner, vice-president; E. G. Alfry, secretary, and C. L. Woolsey, treasurer. The construction of fifty miles of line will be commenced at once, and it is the company's intention to eventually extend its system to Shawnee.

FARGO, OKLA.—The Blue Ridge Telephone Company, of Fargo, has filed articles of incorporation. The capital stock is placed at $1,000, and the following are among the incorporators: G. E. Cashman and S. A. Hall, of Gage; J. J. Johnson, Louis Zahn, W. H. Morgan, J. E. Hutchinson and Will Stephens, of Fargo.

HYDRO, OKLA.—Articles of incorporation have been filed by the Moundview Telephone Company, of Hydro. The company has an authorized capital stock of $2,000, and the incorporators are W. H. Dooley, J. F. Ralf, E. J. Eperly, G. H. Reher, E. Lemon, R. S. McKee and F. L. Newton.

NILES, OKLA.—The Niles Telephone Company has been incorporated with a capital stock of $1,000. Among those interested in the new enterprise are W. F. Stipp, J. E. Starbuck and J. B. Green, of Hinton; E. E. Longfellow and H. W. Nance, of Niles.

BRADLEY JUNCTION, PA.—The farmers west of Bradley Junction have organized an Independent telephone company to be known as the Banner Rural Telephone Company. It is the company's intention to connect its lines with those of the Northern Cambria Rural Telephone Company, and the following officers have been elected: President, Alex. Strittmatter; secretary, H. J. Buck; treasurer, J. M. Huber.

BRANSFORD, TEXAS.—The Bransford Independent Telephone Company has been formed, and is building a line to Grapevine. The company expects to connect its lines with the Independent systems of Worth.

REGINA, SASK., CAN.—The Grain Growers' Association, of Regina, Saskatchewan, has called upon the province to at once install a government owned telephone system, as the association has decided that the Bell Company's service and system is inadequate and unsatisfactory. W. J. Stevens, of Indian Head, Sask., is looking after the matter for the association.

FRANCHISES.

LELAND, ILL.—The village board of Leland has granted a franchise to the Farmers' Telephone Company.

NORTHFIELD, MINN.—The city council of Northfield has been petitioned by the Northfield Telephone Company for permission to install an exchange in this city.

SULPHUR SPRINGS, TEXAS.—An Independent telephone franchise has been asked for at Sulphur Springs by the Rural Telephone Association of Hopkins County, whose intention it is to establish a competing system to that of the Bell Company.

FINANCIAL.

LOS ANGELES, CAL.—The Home Telephone & Telegraph Company, of Los Angeles, expects to increase its annual dividend from 4 per cent to 5 per cent.

BOISE, IDAHO.—At a meeting of the Independent Long Distance Telephone Company, held at Boise, the capital stock was increased from $500,000 to $1,000,000.

MASCOUTAH, ILL.—The capital stock of the Looking Glass Prairie Telephone Company has been increased from $10,000 to $20,000.

BRONSON, IA.—A dividend of 15 per cent has been declared by the Bronson Telephone Company.

WARREN, N. H.—The Baker's River Telephone Company has increased its capital stock from $8,000 to $12,000.

LOWVILLE, N. Y.—A dividend of 5 per cent upon its preferred stock, payable March 1st, 1907, has been declared by the Black River Telephone Company.

MIDDLETOWN, N. Y.—The Middletown Telephone Company has declared a dividend of six per cent. on its preferred stock.

LANCASTER, O.—The Lancaster Telephone Company has declared its regular quarterly dividends of 1 per cent and 1½ per cent on its common and preferred stock, respectively.

BENTON, PA.—An annual dividend of five per cent. has been declared by the Farmers' Telephone & Supply Company of Benton.

SOMMERVILLE, PA.—Ten thousand dollars has been added to the capital stock of the Summerville Telephone Company.

COMBINATIONS.

STREATOR, ILL.—Messrs. Conklin, Parker and others, of Streator, who own the system in this city, have purchased the telephone system at Leavenworth, Kan., and it is their intention to reconstruct and enlarge the plant.

ST. PETER, MINN.—The Nicollet County Telephone Company is planning to improve its system by taking over the Sibley County line owned by A. A. Buck, of Henderson. This will involve the expenditure of upwards of $12,000.

ELECTIONS.

COVINGTON, ILL.—The Covington Mutual Telephone Company has elected H. H. Bening, president; Fred Weeke, vice-president; J. F. Kemper, secretary; William J. Hughes, treasurer; Fred Reinhardt, trustee.

HIGHLAND, ILL.—The following officers have been elected by the Highland Farmers' & Merchants' Telephone Company: J. S. Cuming, president; J. S. Hoermer, vice-president; Leo. Brandweiee, secretary; Fred. Pauly, treasurer.

GRANVILLE, IA.—The Granville & Remsen Telephone Company has elected the following directors: Henry Sauer, William Hensing, J. N. Trienen, James Mulvany, A. P. Dornbush, E. Budden and P. Tonsfeldt.

KELLOGG, IA.—At a recent meeting of the Kellogg Mutual Telephone Company the following officers were elected: J. E. Craven, president; L. C. Wutts, vice-president; W. H. Stuart, secretary; J. W. Reimer, treasurer.

NORRIDGEWOCK, ME.—The following officers have been elected by the Farmers' Telephone Company: President, J. W. Packard, Skowhegan; business manager, Frank L. Ames, Norridgewock; directors, J. W. Packard, F. L. Ames, G. H. Foster, W. W. Greason, J. M. Brown and Anson Baker.

GRANBY, MASS.—The directors of the Granby Telephone Company are G. F. Eastman, H. H. Macey, G. F. Bell, S. B. Dickinson, H. S. Taylor, D. R. Barnes and A. T. Warner.

HIGHLAND, MICH.—The Highland Rural Telephone Company has elected W. S. Seaver, president; H. Gaunt, vice president; F. Skinner, secretary; Geo. Potts, treasurer.

THE WEEK'S MESSAGES

KIBBIE, MICH.—The following officers have been elected by the Kibbie Telephone Company: President, S. M. Trowbridge; vice-president, Robert Adkin; secretary and treasurer, J. H. Tripp; directors, H. M. Olney, O. M. Vaughan, G. L. Green, W. S. Bradley and T. A. Bixby.

LESLIE, MICH.—The officers elected by the Leslie & Onondaga Telephone Company for the ensuing year are: President, H. Baldwin; vice president, A. DeLaur; secretary and treasurer, F. C. Baldwin.

VIOLA, MINN.—The Viola Telephone Company's officers for 1907 are: President, J. C. Bierbaum; vice president and treasurer, G. L. Wood; secretary and manager, H. A. Doty; directors, J. C. Bierbaum, G. L. Wood, H. A. Doty, W. G. Early and C. H. Shellhammer.

MENDOTA, MO.—The following officers and directors have been elected by the Chariten Telephone Company: R. W. Maning, president; B. W. Porter, vice president; L. C. Corpron, secretary; M. Maring, treasurer; A. F. Williams, purchasing agent; directors, R. W. Maning, B. W. Porter, A. F. Williams, L. C. Corpron, John Farnsworth, A. Carminey, H. Forbes, D. Simmons, B. Cloniger, J. Hart, O. L. Pickins, Geo. Hunt, M. Maring. The company, which was incorporated one year ago, now has connection with seven adjoining towns.

BEATRICE, NEB.—The following officers have been elected by the Gage County Independent Telephone Company: A. R. Morris, president; A. R. Patton, secretary; A. H. Krause, treasurer; directors, J. B. Reiff, S. C. Van Riper, L. M. Swett, George Search, Chas. Mason and Julius Neumann.

KENESAW, NEB.—The following directors have been elected by the Kenesaw Independent Telephone Company: S. A. Westing, D. D. Norrin, H. R. Coplin, E. J. Latta, Stephen Schultz, G. W. Wolcott, W. H. Parmenter and A. S. Howard.

PORT JERVIS, N. Y.—The Port Jervis Telephone Company has named as directors M. Depuy, F. N. Mason, S. H. Gariss, C. P. Reuling, J. T. Van Etten, J. P. Van Etten, W. A. Parshall, J. D. Swinton, E. F. Mapes, W. L. Cuddebach and E. B. Lambert.

CONESTOGA, PA.—The following directors have been elected by the Conestoga Telephone Company: Jacob Hartz, L. Keller, E. L. Zerr, H. G. McGowan, J. W. Flannery, J. F. Boyer, F. B. Brown, C. H. Armour.

SUMMERVILLE, PA.—The officers of the Summerville Telephone Company are: President, J. K. Brown, Summerville; vice-president, William Osborn, DuBois; secretary, J. S. Hammond, Reynoldsville; auditor, S. M. McCreight, Reynoldsville; treasurer, D. L. Taylor, Brookville.

MISCELLANEOUS.

REINBECK, IA.—The United Telephone Exchange at Reinbeck, formerly owned by H. B. Shoemaker, has become the property of J. H. Shoemaker, of Waterloo, and Robert Parker, of Traer.

MORAN, KAN.—The Moran Telephone Company has passed from the hands of Messrs. Thompson and Wilson to those of Epperson Bros., of La Harpe.

WEST PLAINS, MO.—The West Plains Telephone Company has been purchased by W. L. Bell, of Kansas City.

PERSONAL.

EDWARD BARRON has been appointed manager of the Wisconsin Telephone Company's exchange at Green Bay, Wis.

J. W. CREWS has taken charge of the business of the Southern Bell Telephone and Telegraph Company centering at Charlotte, N. C., with the title of assistant general manager.

C. H. DALEY, of Birmingham, Ala., has been made manager at the Warrior exchange of the Southern Bell Telephone and Telegraph Company.

ANDREW M. DRISCOLL has been appointed manager of the New England Telephone & Telegraph Company's exchange at Southbridge, Mass.

L. M. JONES has been promoted from the management of the exchange at Tulsa, I. T., to a position in the construction department of the Pioneer Telephone Company.

New Construction in the Field

FAYETTE, ILL.—Many improvements are to be made in the lines of the Fayette Telephone Company at Barr.

FERDINAND, IND.—The lines of the Home Telephone Company are being overhauled at Ferdinand.

WASHINGTON, IND.—The Home Telephone Company contemplates the expenditure of between $40,000 and $50,000 in the rebuilding of its system. This step has been made necessary to take care of the rapidly increasing business of the company.

EARLING, IA.—A new switchboard has been installed by the Earling Telephone Company to meet the growing demand for service.

LASSWELL, KAN.—The Ranchman's Telephone Company is building a new exchange at Medicine Lodge. The company also expects to build a number of other mutual lines throughout the country, effecting long distance connections with Wichita and many other points south and east of Lasswell.

SHELBURNE FALLS, MASS.—New lines are being built by the Deerfield Valley Telephone Company at Shelburne Falls.

GOLDSMITH, NEB.—Many extensions in its lines are under consideration by the Southern Nevada Telephone & Telegraph Company. Copper metallic circuits are being strung from Goldfield to Rhyolite and Greenwater, and additional lines are planned between Tonopah and Goldfield.

WYMORE, NEB.—Considerable new cable is being strung by the Independent Company at Wymore, and it expects to shortly install an exchange at this place.

LEONARDSVILLE, N. Y.—The lines of the Leonardsville Telephone Company are to be extended to Bridgewater and its system otherwise improved.

AKRON, O.—Many improvements are being made by the People's Telephone Company in its system at Akron.

IRONTON, O.—Lines are being constructed by the Home Telephone Company from Ironton to Marion, which will give connection with Wilgus, Getaway and Lecta.

KENTON, O.—It is the intention of the Kenton Telephone Company to expend $20,000 in the improvement of its system. A new switchboard having a capacity for 4,000 subscribers is to be installed, as well as a quantity of additional cable to bring the outside capacity up to that of the new board. The company expects to make its system up-to-date in every particular.

MACHIAS, N. Y.—The Machias Telephone & Electric Company, recently incorporated, is rapidly extending its system, and will soon have between forty and fifty miles of line in operation.

SHERBURNE, N. Y.—Many improvements are being made in the plant of the Sherburne Telephone Company.

NORWALK, O.—The Local Telephone Company, which has just completed a line from Norwalk to Olena that will be connected with the Olena Telephone Company, contemplates the erection of additional lines to North Fairfield to take care of its increasing business.

PORTSMOUTH, O.—A new line is being erected by the Portsmouth Telephone Company from Portsmouth to Otway.

SAND CREEK, OKLA.—New lines have been built by the Sand Creek Rural Telephone Company from Sand Creek to Wakita.

MONTROSE, PA.—Many improvements are being made in the system of the Montrose Telephone & Telegraph Company.

BIG SPRINGS, TEX.—A new line is to be built by the Big Springs Telephone Company from Big Springs to Abilene.

FERRYVILLE, WIS.—New lines are being built in Freeman by the Ferryville Telephone Company.

LENA, WIS.—The Farmers' and Merchants' Telephone Company is extending its lines east of Lena.

PEMBINE, WIS.—It is the intention of the Amberg Telephone Company to build a toll line from Pembine to Niagara. The line will be built along the St. Paul road to Anderson's Spur and thence to Niagara. Lines will also be built to towns on the Wisconsin and Michigan road as far as Miscouno Inn.

WHEATLAND, WIS.—The lines of the Burlington, Brighton & Wheatland Telephone Company are being extended in Wheatland.

ZENDA, WIS.—The New Era Telephone Company, of Hebron, is constructing three new lines to Zenda.

MONTREAL, QUE., CAN.—The Canadian Pacific Railroad Company has decided to install a telegraphone system along its North Shore division, and, if it proves satisfactory, it will be installed along the company's telegraph wires.

PACHUCA, MEXICO.—The Hidalgo state government has made a contract with Messrs. Stephen Waters and Jonas Alfred Renstrom for the establishment of a telephone system to unite Pachuca with the various mining towns and villages of the state.

UNDERGROUND.

EXCELSIOR SPRINGS, MO.—The Home Telephone Company is to place its wires underground in the business district of Excelsior Springs.

ST. JOSEPH, MO.—The Citizens' Telephone Company expects to place its wires underground in the business portion of St. Joseph.

OSWEGO, N. Y.—The Common Council of Oswego is considering the advisability of compelling telephone companies to place their wires underground.

OUR TRADE MARK

Every time you see it on correspondence on your desk it means a chance to save money.

We issue quarterly a net price list of line construction lumber, plain and galvanized hardware and telephone wires and cables. It contains up-to-date market prices and enables prospective purchasers and engineers to make estimates on new construction. Ask for it and you will be placed on our lists and receive it regularly.

The Gould Plate Retains Its Active Material

The Gould process of plate making develops, on the "blank" of rolled lead, a deeply ribbed contact surface for the active material. The active elements are formed, electro-chemically, out of the lead of the ribs and are always maintained in close electrical and mechanical contact thereto. The Gould plate does not deteriorate by falling out of active material. The diagram shows in cross section the active material formed between the ribs of the support plate.

It will pay you to write for our literature on Telephone Storage Batteries.

JUST A SUGGESTION

Take one of your busy 4-party lines and equip it with "POOLE" Lock-Outs. Leave it in service a month and then see how many of the four will stand a raise of $3.00 a year rather than go back to the old way. We know the answer, but we want your subscribers to impress on you the fact that the "POOLE" Lock-Out is a rate-raiser.

It won't cost you anything to try it, because we will loan you the Lock-Outs free and there is no other equipment required. Write today for our Booklet AL-2.

TOLL LINE SIGNAL

This signal is made up of standard ringer coils and a regular jack. The striker rod of the ringer has a projection beyond the striker ball which engages the drop. The mounting plate is just twice as large as the plate for five Monarch drops and jacks, so two ringers, drops and jacks occupy the space of ten drops and jacks. Our catalogue describes this toll line signal.

You Wouldn't Start a Horse Car Line

in this age of electric cars? Not if you wanted to make money out of the business of transportation.

Then why should you start a manual telephone exchange in this age of automatics, if you want to make money out of the telephone business?

The automatic system of telephony bears the same relation to the manual system that the electric car does to the horse car. It is the apotheosis of telephone development, as the electric car is of transportation development.

The automatic telephone system produces the best service more economically than indifferent service can be produced with manual equipment.

There is no more question as to the relative popularity of the automatic and manual telephone service where the two kinds are in competition than there is as to the relative popularity of the trolley car and the horse car.

And, as for the securities—the same comparison may be applied with the same results.

Our Automatic system has been adopted in the following cities:

Aberdeen, S. D.	Clayton, Mo.	Jonesboro, Ark.	Ocean Park, Cal.	Springfield, Mo.
Akron, Ohio.	Cleburne, Texas.	Lake Benton, Minn.	Pentwater, Mich.	St. Marys, Ohio.

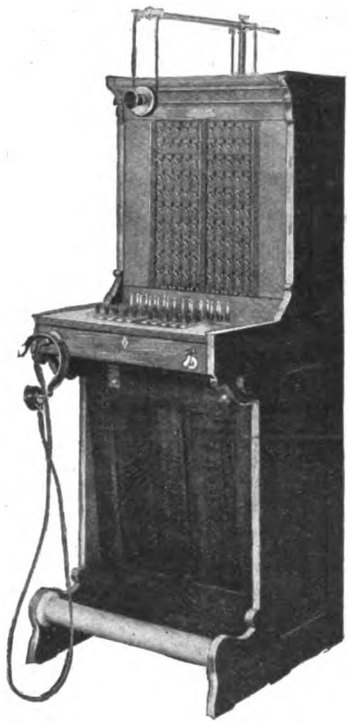
KELLOGG

TELEPHONE APPARATUS

MAGNETO SWITCHBOARDS

ARE EQUIPPED WITH KELLOGG

WATCHCASE HEAD RECEIVER



This type of a receiver is very compact.

The shell is entirely made of hard rubber and has a removable ear-piece.

The spring steel headband is covered with leather and is provided with a hinge, so that it may be swung backward. It is so constructed that it will not catch in the hair of the operator.

It is impossible for the operator to get a shock from this receiver, as there are no exposed metal parts, which will make contact with the head.

THE CORD TERMINALS are so constructed that standard cord tips can be used on receiver cord, and be practically concealed. This construction absolutely prevents a short circuit in the receiver. Cords can be securely attached or removed without opening the case.

The six semi-circular MAGNETS are supported by the case from the back and sides. They are made of special magnet steel, and retain their magnetism indefinitely.

The two Norway iron POLE PIECES are also supported by the case

THE MAGNET COILS are wound to 60 ohms resistance.

THE DIAPHRAGM is made of ferro-type metal.

THE ADJUSTMENT is made permanent by the general construction of the receiver.

THE OPERATOR'S CUT-IN JACK is very compact in design and does not interfere with apparatus mounted on the keyshelf. The springs of German silver are platinum pointed, U-shaped and are of good length without making the jack long.

THE CUT-IN PLUG is very short, and does not protude from the face of the keyshelf to interfere with the operator. The handle is of hard rubber; the tip and sleeve contact of brass.

This receiver is furnished with a 72-inch two-conductor green silk cord.

For switchboard work it is the most successful compact receiver on the market to-day.

BATTERIES WITH BRAINS

Not that Nungesser Batteries have brains, but that it takes brains to make them.

Brains trained through nineteen years' experience, studying the many problems of battery manufacture, give to the "1900" Dry Battery a superiority that is best attested by its extensive and ever-increasing use in all parts of the world where dry batteries are used.

If the name NUNGESSER is on your dry batteries you may be sure they are right, and yet it costs you no more to get this stamp of excellence and the good service that always goes with it.

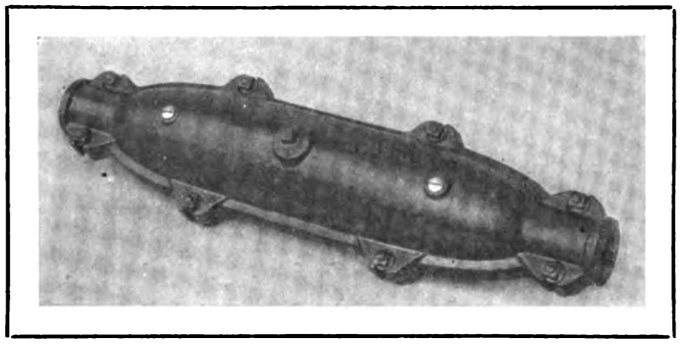
Telephone System of Sewerage Plant at Schöneberg, Germany

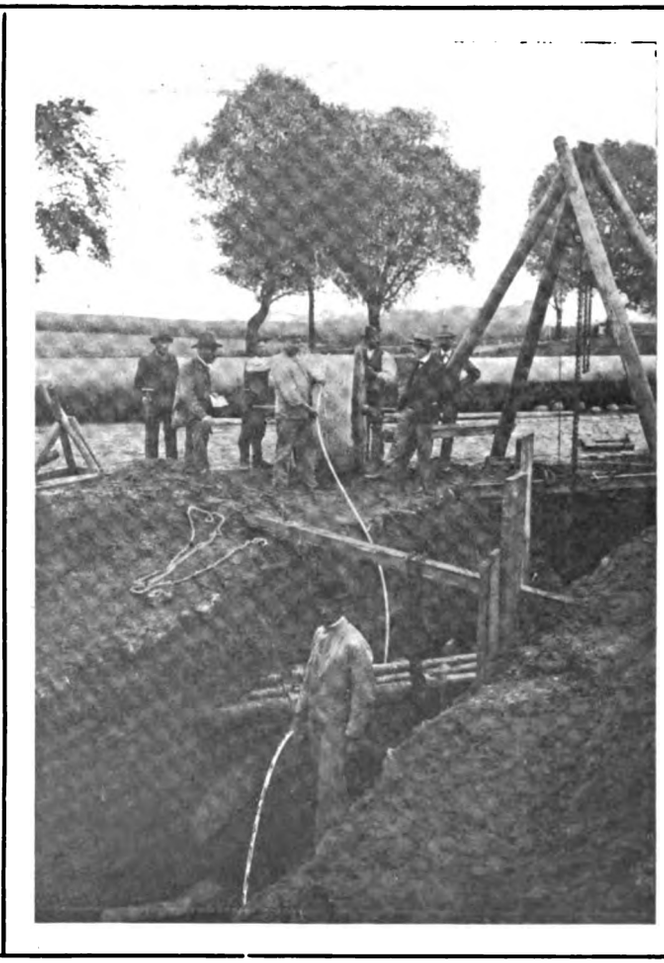
By Dr. Alfred Gradenwitz.

An all-cable telephone system was recently installed in connection with the municipal sewerage plant of Schöneberg, Germany, which presents several novel and interesting features. Cables were in this instance, as in many others, preferred to overhead conductors, which are easily damaged by gales, snow, hoarfrost, etc., while operation is apt to be interfered with by thunder storms. While overhead conductors are frequently substituted for cables in spite of the above drawbacks this is only done for the sake of economy. The relatively high cost of using cables is, however, in the first place dependent upon the necessity of digging a special cable trench. Whenever such a ditch is to be dug in any case, as for instance with sewerage and water distributing plants, the objection to the laying of cables on account of cost disappears. In the present case the difference in cost between the use of cable and that of overhead conductors was still further reduced owing to the immediate neighborhood of the protecting sewerage pipe, which made it unnecessary to provide a roofing, as over an ordinary conduit. In the Schöneberg system the cost of laying the cable over the considerable distances between the terminal stations was still further reduced to a very material extent by using the Pupin system, which allows a relatively small copper conductor and correspondingly thin and cheap copper cable to be used, thus enabling excellent transmission to be obtained at a low cost.



Iron Box in Which Pupin Loading Coil is Placed.

Laying Cable in Trench Beside Large Sewage Pipe.



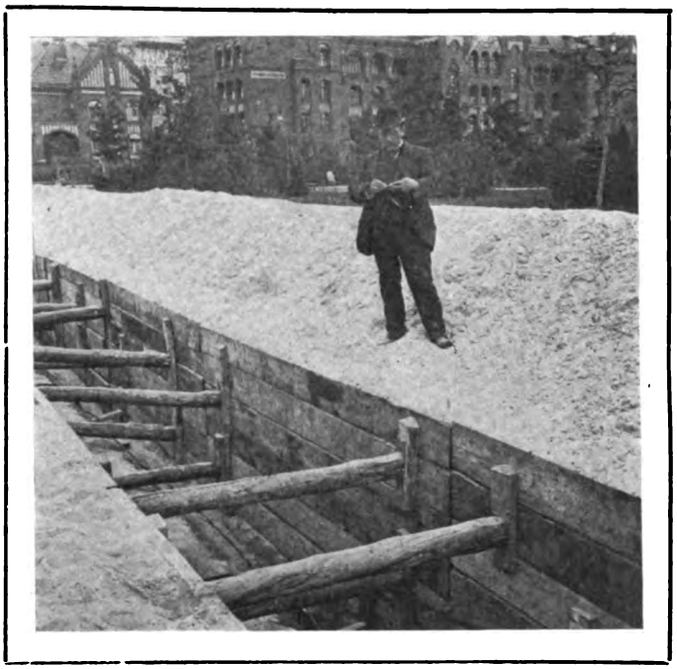
Running the Cable Into the Trench From the Reel.

Digitized by Google

Messrs. Siemens and Halske, Ltd., have in the course of the last few years made contracts for many telephone plants in connection with municipal sewerage systems. In all these the cable is laid in the ditch very close to the sewage pipe. The illustrations presented with this article show some of the features of this work as carried out along the pipe line between the city of Schöneberg, near Berlin, and its sewage fields in the neighborhood of Ragow. While the distance between the two places is about 27 kilometers, the extensions of the telephone system were of such length as to make the maximum talking distance upwards of 60 kilometers. This distance is sufficient to prohibit the use of an unloaded cable, owing to the fact that in such an event the capacity effect would be so great as to make transmission so indistinct as to be unintelligible.

In general the methods of carrying on the work of placing the cable were very simple. The reels were set up beside the trench, and cable unwound and carried along beside the pipe, being simply laid on the ground. At some places high pressure pipes had to be put in service before the cable was available. Here ducts were laid and when the cable came to hand they were rodded and drawn in as is usual in the ordinary city system. At intervals along the cable the Pupin loading coils were connected. Protection for them was furnished by small iron boxes, of the type illustrated at the head of the first page of this article.

For connecting the various lines in the cable together as required by the service a small switchboard was provided at the headquarters of the system.



Reinforced Excavations. Cable is Laid Up Along the Walls.

One of the Windlasses Used for Drawing Cable Through Ducts.

Windlass Set Up Over Manhole, Ready for Use.

JOINT USE OF POLES BY TELEPHONE AND ELECTRIC LIGHT COMPANIES.

FACTORS governing the joint use of poles for telephone wires and those carrying heavy currents, at a comparatively high voltage, are the subject of frequent consideration by telephone companies in various parts of the country. Concerning this important matter an engineer connected with one of the large operating companies writes as follows:

In allowing the use of telephone poles by electric light companies there are several points which must be given consideration. It is evident, in the first place, that a certain amount of danger is imposed on the telephone company both as to its employees and its service. In general the electric light company uses copper wire, and larger wire than the telephone company. The telephone wires are, therefore, more liable to breakage than the light wires, particularly if telephone wires are of iron. For this reason, as well as to provide for the safety of employees, it is the best practice, where it is possible without serious expense, at any rate in the construction of new pole lines, to place electric light and power wires above telephone wires. In many sections of the country the Board of Underwriters will not sanction the use of iron circuits over copper power or light circuits. The iron circuit is much more liable to breakage from extreme cold, and this ruling will probably become very general throughout the northern states.

In an existing telephone line, however, where it is impossible to place light wires above them without lowering the telephone wires, so as to obtain the required separation, the objections are usually outweighed by the increased cost. The insurance against danger is not worth the price.

In this event provisions must be made, by contract or otherwise, to safeguard telephone service and employes, in order to avoid interruptions of service and delay in repairs. For this purpose it is customary for the telephone company to regulate the location of light wires and fixtures.

The vertical distance between wires may be reduced to a minimum of forty inches if the pole is gained every twenty inches.

The Iowa Clearing House*

By George T. Hewes.

IN the State of Iowa 95 per cent of the Independent long distance messages are transmitted to points within a radius of 100 miles from any given telephone station. Therefore, the vast number of telephone exchanges and stations throughout the State form a nucleus for the origination and destination of long distance messages which is destined to become greater each succeeding year.

We find no difficulty during the last few years in Iowa in interesting capital in the development of long distance toll lines in territory which is thickly covered with telephone stations, and in this respect the territory covered by South Dakota from Sioux City west to the Black Hills is naturally coveted by prospective investors, and you are to undergo the same transition that we have gone through.

There is no question in my mind but that for some few years to come about 95 per cent. of your long distance business will be within a radius of not more than 100 miles from any given station. You must first provide your cities and towns with numerous telephones which will act as feeders for long distance circuits which ultimately will become inevitable. The desirability has oftentimes been presented to you, no doubt, of your being able to talk with Chicago, New York and Boston, but I question whether many of the telephone men of South Dakota have ever availed themselves of this luxury, even if the privilege were extended without cost. Therefore, why should you at this particular time regard these extremely long distance connections with particular favor. As your facilities which are provided for communication within your trade territory are extended, the percentage of calls going over a distance exceeding 100 miles will be increased.

We, in Iowa, are beginning to realize this since the organization of our Clearing House. The Clearing House is the establishment where all interchanged messages going over more than one company's lines shall be audited and settlements effected between companies for balances due them with equity, fairness and impartiality. Therefore, such an organization which is to be maintained by all Independent telephone companies should be a special organization. We are incorporated under the laws of the State of Iowa. Article 3 of our constitution and by-laws is as follows:

"The object of this corporation, or business to be transacted, is to promote and regulate interchanged telephone service between Independent telephone companies, to pro-rate the earnings and to make settlement thereof between the companies over whose lines toll messages may pass, upon the terms provided in the by-laws of this corporation, check reports of toll messages, and do all things necessary to the adjustment of the proceeds of toll messages."

The expense of clearing interchanged business will be exactly proportioned to the number of messages cleared, and places the smaller company on an absolutely level basis with the larger company.

The first month's business cleared by our organization was for the month of March, 1906, at which time we cleared the business of six companies, and at the present time we have forty-two contracts signed by as many different companies for Clearing House service, and we are clearing the business of thirty companies for the month of December.

We have profited largely by the experience of the Michigan Independent Traffic Association, which has been engaged in this line of business during the past two years. Our methods are to a considerable extent original with us, for it is true that there are local conditions which require different methods in the long distance business, just as there are local conditions which control your different methods of handling your telephone exchange business.

The best information which we have been able to receive from the experience of others regarding the percentage of errors creeping into long distance messages is from the Michigan Traffic Association, who inform us that the percentage of errors is represented by 14.8 per cent. of the gross amount cleared. This was their efficiency after a period extending over a year of pro-rating business.

Our experience has been quite different, however. During the first four months of our pro-rating, the average errors was 5.4 per cent. of the gross amount cleared. We have been able to reduce this percentage of errors very materially. One of our recent compilations of figures discloses to us that the percentage of errors detected for the month of September will be approximately 2.8 per cent. of the gross amount cleared. We attribute this remarkable showing to the exchange of check numbers between operators. Without this exchange of numbers, I firmly believe that the percentage of errors will be far in excess of the percentage reported by the Michigan Independent Traffic Association. We believe that we have the system and we are encouraged in this belief on account of the recent action taken by the International Independent Telephone Association in convention at Chicago, when they recommended for adoption by all Independent telephone companies our system of telephone toll checks.

Our Clearing House has seen fit to issue Clearing House coupons which are being accepted by Independent telephone companies throughout the State of Iowa, whether members of the Clearing House or not, in the exchange of toll service. These coupons are gotten up in units of $10.00 and $25.00 each. They are to the Independent telephone companies what the interchangeable mileage book is to the Western Passenger Association in the railroad passenger traffic.

We are already effecting balances with the Nebraska Traffic Association for business which originates in Nebraska and terminates in Iowa and for business which originates in Iowa and terminates in Nebraska.

*Abstract from an address delivered before members of the South Dakota Independent Telephone Association at the Sioux Falls convention.

SOUTH AFRICAN TELEPHONE STATISTICS.

TELEPHONE development in South Africa is very low. Statistics issued by the Postmaster General show that there has been very little building outside of the centres of population, there being practically no rural lines such as exist in the United States. At the present time the country is not sufficiently thickly settled to support such systems in many districts on a commercial basis. In the Transvaal figures for the year ending June 30th, 1905, which are the latest available, show that in the district of Johannesburg there were 319.2 miles of lines, and a total of 7,657 miles of wire on poles and in cables. Corresponding figures for the district of Pretoria show 93.1 miles of lines, with a wire mileage of 1,350. The receipts for telephone service were $221,161.17 for this yearly period, a considerable increase over the corresponding period next preceding, when the telephone service brought in only $162,931.28.

The number of telephone subscribers in the principal cities is as follows:

Johannesburg	1,314
Pretoria	282
Germiston	52
Krugersdorp	30
Boksburg	33
Total	1,711

In addition to the stations of these subscribers there are 177 telephones operated by the government, of which the greater part are about evenly distributed between Johannesburg and Pretoria. There are 23 telephone pay stations for the receipt of messages in this State.

In Southern Rhodesia there are a far smaller number of telephones only five cities and towns being large enough to have an

Digitized by Google

established exchange, the number of subscribers in each being as follows:

Salisbury	91
Buluwayo	117
Umtali	29
Selukwe	18
Gwelo	14

The receipts for the year beginning on the 31st of March, 1904, and ending on March 30, 1905, were $17,287.98. This is something over $2,000.00 less than the receipts for the previous year, when the returns were $19,121.48. The falling off is, of course, due to the serious depression of business which occurred during the year ending March, 1905, owing to the troubles in the State.

In Natal at the end of December, 1905, there were 2,304.5 miles of telephone wire, and the receipts for the telephone service amounted to $29,322.87.

A FOUR YEARS' BUILDING RECORD.

INDEPENDENT telephone development has made remarkably successful progress in Portland, Ind., during the past four years. About four years ago the telephone franchise was bought from the United Telephone Company by the Home Telephone Company, organized by a number of men who wished to keep the control of the telephone system in local hands. At that time between two hundred and fifty and three hundred patrons were receiving a very indifferent service. Its poor quality was due in a large measure to the use of equipment of old types. The men who bought the plant, after considering the development as it then existed, and the possibilities in the way of extensions, decided that the maximum capacity on which they could safely count would be about five hundred telephones. It was but a very short time, however, before they learned that their estimate had been much too low, and the growth has kept up rapidly until the present time. There are now 1,065 telephones connected to the lines of the Home company. In addition to its own instruments, the subscribers of the company have free connection with not far from 200 telephones at Salamonie

The Bell company was passed long ago in the race for business, and now handles only a very small proportion of the telephone messages transmitted in this territory. It has only 275 telephones in the town and surrounding country covered by the lines of the Home company, and most of its subscribers are more than six miles away from the city on a few rural lines. As in other places, much of the business which it now handles has been obtained by giving free service for three months; and it is stated that sometimes no rental at all is collected from favored subscribers, in order that it may retain the appearance of having a good hold in the territory.

That the Independent company merits success is in a measure indicated by the character of the construction shown in the accompanying photograph. This was made from a picture of a regular farm and toll line lead running to the north of the city of Portland. This lead was built not long ago to accommodate a sufficient number of lines to care for the ever increasing demands for Independent telephones in this locality. The rentals from the 1,065 telephone and the toll receipts have enabled the company to not only pay dividends at a good rate, but expend each year a considerable sum from the income of the plant for new equipment. The plant of this company is looked upon as highly efficient, both from an operating standpoint and in respect to its earnings. The success of the company is locally asserted to be due to the strength and good judgment of men who are thoroughly familiar with conditions in the territory in which it operates, its officers being: President, Frank White; secretary, E. E. McGriff; treasurer, Dr. C. W. Mackey; Morris Weiler, Lou Chamberlain, Judge J. W. Headington, Dr. W. P. Jones, Dr. J. T. Dickens and Dr. W. D. Schwartz. The active management of the business is in the hands of A. B. Baughn.

Straight Poles and Cleanly Run Wires in Indiana. At the Left Are the Men Who Do the Work.

JOINT USE OF POLES BY TELEPHONE AND ELECTRIC LIGHT COMPANIES.

(*Continued from page 86.*)

There should be a minimum opening between light wires at the pole of thirty-two inches; that is, the nearest wire on each side of the pole must be at least sixteen from the centre line.

All light wires should be attached by glass or porcelain insulators to cross-arms—not to brackets.

Where light drops are taken out laterally, insulated wires on porcelain knobs should be carried along the back of the arm to a transverse fixture at the end.

Where it is necessary to place a transformer on a joint pole it should be bolted to cross-arms and set out from the poles so far as not to interfere with climbing by it.

Where it is necessary to carry light or power loads up or down a pole through a telephone lead the light or power lead should be encased in approved conduit. The same rule applies to telephone wires carried through a light lead.

These are a few general requirements. Other regulations to fit local conditions and detailed arrangements are frequently necessary.

TENNESSEE CONSIDERING BILL REGULATING HIGHWAY RIGHTS.

THE Tennessee Legislature is considering a bill vesting in the county courts of each county in the State the title to all public highways and roads, and giving to the counties the right to grant or refuse rights of way on these highways to telegraph, telephone or railway companies. Telephone companies in Tennessee have recently met with many difficulties in securing rights of way along public roads. Under the old law any individual living along the line of the road may make complaint, being part owner of the highway by virtue of abutting property, and cause the county courts to refuse right of way. The Independent Long Distance Telephone Company, now

Digitized by Google

building through the State, has taken a score of such cases to the courts and in numerous cases have failed to get right of way. If the new measure becomes a law parties applying for right of way will deal only with the county court.

TENNESSEE CONSIDERING PHYSICAL CONNECTION BILL SIMILAR TO THOSE PROPOSED IN SOME OTHER STATES.

SENATOR A. G. EWING has introduced in the Tennessee senate a bill requiring all telephone companies to connect subscribers with long distance lines of other companies. The bill provides, among other things, that the cost of making such connection shall be borne equally by the companies thus physically joined, and shall be made under the supervision of each. In case of a disagreement, each company may select an electrical engineer, and these two a third, to form a board to settle any questions involved in the dispute. The division of expense is to be equal.

For toll service a division of receipts shall be made in proportion to mileage, and for local messages a two-cent fee for switching may be charged. In relation to the discrimination of one company in favor of messages originating upon its own lines, there is a provision prohibiting such acts, and carrying a penalty of from fifty to five hundred dollars for each offence. It is provided that the Courts of Equity shall be given jurisdiction to enforce the provisions of the act.

A BILL COVERING THE GRANTING OF FRANCHISES IN CITIES OF BETWEEN 5,000 AND 25,000 INHABITANTS IN NEBRASKA.

SENATE BILL NO. 126, now up for consideration in Nebraska, provides that in cities having between 5,000 and 25,000 inhabitants franchises may be granted to telephone companies only when favored by a majority of electors, as shown by a vote cast at a general or special election, upon a proposition duly submitted by the city council.

OFFICIAL BULLETIN NUMBER SEVEN OF THE INTERNATIONAL INDEPENDENT TELEPHONE ASSOCIATION OF AMERICA.

SECOND SERIES.

Executive Committee met in the office of the president, Cleveland, Ohio, January 7th.

Ways and means were considered for extending the association work, and carrying it on more vigorously along broader lines, as explained in the report of this meeting published recently.

Under the resolution which was at this meeting adopted to provide for honorary membership, to which officers of Independent companies and association, and other individuals interested in the Independent field would be eligible, quite a number have already been enrolled as members and additional subscriptions are being sent in daily for consideration. Everyone in the field eligible is urged to take advantage of this honorary membership. Full details, including privileges extended to honorary members, will be furnished upon request.

The committee also authorized the publication of an official bulletin, first number to be issued not later than April 1st. This will contain the names of honorary members and all contributors to the association, with a great deal of information of value to the Independent interests. It will be published monthly under the title of "The Shield Chronicle." Subscriptions will be 25 cents per year.

After considering the names of all cities desirous of entertaining the next convention, Chicago was selected as being the most suitable site. June 4th, 5th and 6th were fixed as the dates for the convention; the advisory board meeting to be held on the 3d.

At the informal meeting in Chicago on the 16th and at a joint meeting between representatives of the association and those of manufacturing and kindred interests, held in Chicago, January 22d, plans were perfected for securing the co-operation of all interested in the Independent field, in obtaining funds for the association upon an equitable basis.

Reports presented at the three meetings above mentioned indicate that the present condition of the Independent movement is very satisfactory, and the prospects of the future are very encouraging. The important thing is for the Independents to continue working together, the aim of each company and individual being the greater good of the entire movement. Active, hearty co-operation is essential to the achievement of our greatest possibilities.

STATE MEETING.

The granting of an Independent franchise at Milwaukee has had a wonderfully stimulating effect on the Independents of Wisconsin, and the state meeting held on the 16th and 17th of January at Madison was the best in the history of their association.

The South Dakota association had a splendid meeting on the 10th and 11th. The incorporation of the word "Independent" in their association title indicates that its policy will be more strictly Independent than in the past.

The Vermont and New Hampshire association held an arousing convention on January 8th, at Bradford, Vermont. The Independents in the Northeast are making wonderful strides. Their success in obtaining franchises at Boston and other progressive places, and the recent favorable publicity given the movement in the Boston and New England papers generally, has been of great benefit in strengthening the position of the Independents throughout that section.

Advanced reports from the Nebraska state meeting, at present (January 23) in session at Lincoln, are that it is the best they have ever had. The report of the state officers is that the Independents in Nebraska are in a very flourishing condition.

Annual conventions are planned for a number of states for the next month. An Independent company could not make a more profitable investment than by sending as many representatives as possible to its state or neighboring state's convention. To obtain the benefit of co-operation, it is necessary to take an active interest in the affairs of your organizations.

CONVENTION DELEGATES.

The state associations who are holding annual meetings, should not forget to elect their delegates to the international convention.

STATISTICAL DEPARTMENT.

The association is still gathering map data. Don't overlook or underestimate the value of this work, and if you have not already done so, please *send us that map of your lines at once.* We are going to keep asking for it until we get it. You can reduce the expense of this work, and hurry it along by doing your part promptly. Hadn't you better mail that map to-day before you forget it?

"LOOK FOR THE SHIELD."

Orders for "Shield" supplies during the last month included companies in the extreme Northeast, Northwest and Southern states. This will give you some idea of the extensive use of the "Shield" by the Independents. The "Shield" means a great deal to the Independent people as their official emblem, and is the best advertising medium that could be selected. No Independent exchange or pay station can be considered complete until equipped with standard toll signs. This form of advertising pays good dividends and keeps the public informed that your plant is part of the great Independent movement, the extent of which is being made known through the widespread use of the "Shield."

The supply department is at your service whenever you want "Shield" supplies. Lowest prices consistent with best goods obtainable. Illustrated catalog and samples sent upon request. Better order those *toll signs* while you think of it.

IN THE OPERATING FIELD

GROWTH OF INDEPENDENT TELEPHONE COMPANY IN LANCASTER COUNTY, PA.

THE Columbia Telephone Company was the first Independent company to give service in Lancaster County, and was one of the earliest Independent companies to be started in the state of Pennsylvania. It commenced business at the beginning of the year 1897, with only 42 subscribers, who were all located in the town of Columbia. It had at that time an authorized capital stock of $5,000, with only $2,500 of that amount subscribed, and of this amount only $600 was cash on hand when business started. Under the management of Harry C. Young, who organized the company, and has since its incorporation been president and general manager, its business has grown substantially, and recently with increasing rapidity. The capital stock has been increased to $75,000, and 6 per cent dividends are said to have been paid from the very first. At the present time the system has 700 subscribers, to the number of which additions are being constantly made.

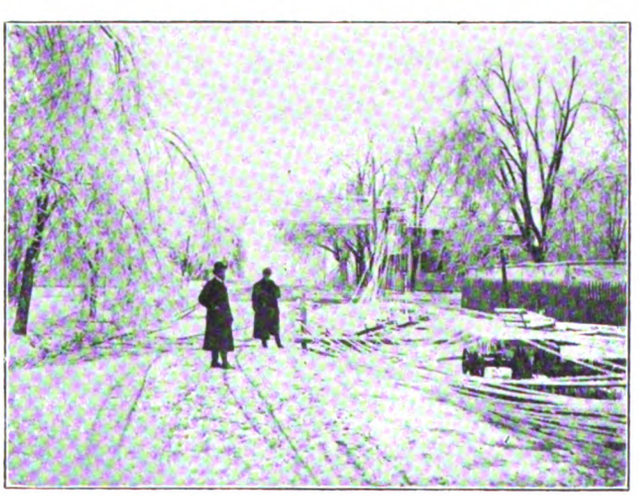
SUMMARY CUTTING OF CONNECTIONS BY THE BELL COMPANY AT OWENSBORO, KY., AROUSES INDIGNATION.

BY a shrewd deal the Cumberland Telephone and Telegraph Company acquired control of the rural lines in the vicinity of Owensboro, Ky., which had been connected with the Independent telephone company at that place. Not content with

THE SLEET AND SNOW DAMAGE STORY CONTEST

THE photograph from which the illustration on this page was made shows an incident upon which might be based an article that would win the $20 prize offered by THE AMERICAN TELEPHONE JOURNAL. It is believed that the articles submitted in competition for this prize will be so interesting that it is desired that every telephone man who has an opportunity shall take part in it. In order that no telephone men, through having recently subscribed for this paper, or for any other reason, may be shut out of this contest through lack of knowledge, the conditions which govern it are here repeated in full.

To show how the danger of losses from sleet and storms may be diminished by proper original construction of telephone lines, THE AMERICAN TELEPHONE JOURNAL offers a group of prizes for the best three articles on the subject presented before the first of next April. These articles must describe the effects of an actual accident, resulting from the loading of wire, cables or fixtures with sleet or snow.



View of Fallen Telephone Lines, Loaded with Ice. Illustration Reproduced from Everbest Magazine by Courtesy of Ewing-Merkle Electric Company.

Each article must be accompanied by one or more photographs of the sleet-covered equipment, taken during the present winter, immediately after its fall. Articles must describe fully the nature of the load on supports, telling why they failed. The form of construction which the author believes would probably have been most effective in preventing the loss, with reasons for his belief, must be described. Particulars as to the effect on service, such as number of lines out, length of time interrupted, number of complaints, any advantages gained by competitors not subject to such interruption at the same time, and losses due to rebates to subscribers whose lines were put out of service, should, if possible, be included, in order to give sufficient information to enable readers to form an approximate idea of the actual cost of damage, from the broadest point of view. The actual cost of material and labor for making repairs would of course be desirable.

Articles must not exceed 2,000 words in length. Awards of $20, $15 and $10 will be made for the first, second and third prizes, respectively. Payment for any other articles received will be made at regular rates if accepted for publication, so that the time expended by any contributor of good material will bring him due compensation. THE AMERICAN TELEPHONE JOURNAL reserves the right to refrain from considering the author of any article as a candidate for a prize if the material submitted cannot be developed into a form acceptable for publication. Each article must deal with a single case of line failure. Any person may contribute as many separate articles as he wishes, provided they deal with separate subjects. Awards will be made as soon as possible after April 1. Judgment will be based on the merits of photographs and articles from a strictly practical standpoint, on the value of the facts they present, and not on the mere wording of the articles. No discrimination against an article on account of lack of literary style will be made.

This competition is open freely to all who may desire to compete, without charge or consideration of any kind, and prospective contestants need not be subscribers of this publication in order to be entitled to compete for the prizes offered.

There are reasons why the illustration published herewith does not fully conform to the requirements which will be likely to be met by the winner of the prize, although taken by itself it shows that it was made from an exceptionally interesting photograph. For the benefit of those who wish to obtain hints which will be useful to them when the storm calls for quick work with the camera, these reasons have been written out, and will be sent to every interested person who mails a request for them to THE EDITOR, AMERICAN TELEPHONE JOURNAL, 100 WILLIAM STREET, NEW YORK CITY. Write to-day and get these suggestions. *They may help you land that twenty.*

Digitized by Google

its success in a business transaction, the company felt obliged to celebrate. The interesting manner in which it indulged its joyous spirit was to cut connections between the country lines and the city exchange during the night, without giving notice to subscribers on either set of lines. The confusion during the next morning may be imagined, and naturally the subscribers to the rural lines are all anxious to go back to the Independent connection.

INVESTIGATION OF TELEPHONE SERVICE IN THE DISTRICT OF COLUMBIA TO BE CONSIDERED.

IN the House of Representatives there has been introduced a resolution providing for an investigation into the rates charged for telephone service, and the efficiency of the service in the District of Columbia. The Committee on the District of Columbia named as the body to conduct such an investigation, is to be fully empowered to send for persons and papers, to compel the attendance of witnesses, and to take such other steps as may be necessary for a full and reliable investigation.

REDUCED RAILWAY FARES TO SIOUX CITY FOR IOWA CONVENTION.

A SPECIAL rate of one and one-fifth times the regular one way fare for the round trip to Sioux City for the Iowa Convention, from any point west of Chicago, has been granted through the efforts of the Iowa Independent Telephone Association. This convention, which is to be held on March 19th, 20th and 21, is expected to be by far the most important and interesting convention which this association has ever held. The program committee has set to work upon its arrangements, and practically completed them at a very early date with exceptionally interesting results, as may be seen from an examination of the list of speakers and topics.

An especially valuable feature of the meeting will be the presentation of a lecture showing the present state of development in many sections of the country. Operating companies which have attractive buildings are co-operating with the association by sending photographs, in accordance with the plan announced by THE AMERICAN TELEPHONE JOURNAL in the issue of February 2nd. All companies which have not yet taken advantage of this opportunity should do so at once, in order that the necessary slides may be prepared. This plan has received the hearty endorsement of President Hoge, of the International Association, and there is no doubt that it will be, in connection with the other exceptionally valuable features of this meeting, a means of attracting many prominent men from outside of the state.

Every prominent telephone man in Iowa is expected to be present, and an exceptional number of the smaller telephone companies intend to send representatives. Telephone men are urged to make their plans for attending this convention at once. Any information desired can be obtained from the chairman of the program committee, C. H. Smith, care the Independent Telephone Clearing House, Des Moines, Ia., by writing to him.

Program of the eleventh annual convention of the Iowa Independent Telephone Association, Sioux City, Iowa, Tuesday, Wednesday and Thursday, March the 19th, 20th and 21st, 1907.

The program which has been prepared is as follows:

TUESDAY, MARCH 19, 1907.

2:00 P. M. Organization and appointment of committee on credentials, president's address, reports of officers and committees.

4.30 P. M. "Is it advisable to appoint a State Toll Line Inspector?" F. McNally, Carroll, Iowa.

5.00 P. M. The necessary standardization of clearing house toll lines and equipment," W. J. Stanton, Waterloo, Iowa.

EVENING. Given to examination of exhibits.

WEDNESDAY, MARCH 20, 1907.

9:15 A. M. Address of Welcome, W. G. Sears, Mayor of Sioux City, Ia.

"OUR NEIGHBORS."

9:30 A. M. Minnesota.

9:45 A. M. South Dakota, Judge C. B. Kennedy, Canton, S. D., President of The Independent Telephone Association of South Dakota.

10:00 A. M. Nebraska, R. E. Mattison, Lincoln, Neb., Secretary of the Nebraska Independent Telephone Association and Manager of The Telephone Traffic Association of Nebraska.

10:15 A. M. "Ourselves." Report of State Agent for past year, G. A. Hollis, Hudson, Iowa.

11:30 A. M. "The Work of the International Independent Telephone Association," James B. Hoge, Cleveland, Ohio.

12:00 M. Noon adjournment.

2:00 P. M. Afternoon to be used by representatives of Farmers' and Mutual Companies.

3:30 P. M. "Economy of Construction, Labor, Equipment and Management," W. D. Dunsmore, Oskaloosa, Ia., Vice President and Manager of the Oskaloosa Home Telephone Company.

EVENING.

8:30 P. M. Stereopticon Lecture.

THURSDAY, MARCH 21, 1907.

9:30 A. M. Clearing House report of the past year and prospects for the future, Geo. T. Hewes, Des Moines, Ia., Manager of Iowa Clearing House.

10:30 A. M. Independent "Long Distance," E. E. England, Mount Pleasant, Ia.

11:30 A. M. "Hints on Management of Traffic," Roy Walker, Des Moines, Ia., Manager of Mutual Telephone Company.

12:00 M. Noon adjournment.

2:00 P. M. New business and election of officers.

2:30 P. M. Choosing place for next meeting for coming year.

3:00 P. M. "Conservative Financing," A. T. Averill, Cedar Rapids, Ia., President of the Corn Belt Telephone Company.

EVENING—BANQUET.

Cornell University to Use Independent Service Only.

ANNOUNCEMENT has been made by President J. G. Schurman, of Cornell University, Ithaca, N. Y., that a ten-year contract for Independent telephone service is to be executed with the Ithaca Telephone Company. This marks a most satisfactory step in the advancement of the Independent company at this place to a predominant position. The new contract for the University provides for the immediate installation of one hundred and thirty-four telephones, with the right to increase the number to two hundred. This provides a much more comprehensive system than is in use at present, as the University is now using thirty-four telephones connected to the lines of each company. Under the new plan the departments will be connected to a private branch exchange switchboard, with lines to the central office of the Independent company. All construction will be underground.

Its success in this important contract serves to call attention to the extremely rapid development of the Independent company at Ithaca during the past year, owing largely to the efficient efforts of District Manager R. B. Fegan. From eleven hundred and fifty subscribers in the city and county, the number connected to the exchange of the Ithaca Telephone Company has within a year increased to about thirty-six hundred. Preparation for additional growth has recently been made by the placing of between four and five miles of aerial and underground cable, with a capacity for taking care of five thousand new subscribers.

An interesting item of news in connection with the granting of this contract is that members of the executive board of the University, who are all residents of Ithaca, preferred that the decision in regard to the telephone contract should be given by the out-of-town trustees. They therefore allowed the matter to be handled by a committee of trustees in New York City, who, after an impartial investigation, decided that the Independent company was able to give the most advantageous arrangement.

The Cornell contract has been under discussion for some time, and the Bell people had openly boasted that they would secure it. Its award to the Independent company is therefore a most distinct setback to the Bell interests.

THE EDITOR'S PAGE

DOES THE BELL COMPANY ADMIT INFERIORITY OF ITS INSTRUMENTS?

FOR some time past many Independent manufacturers of transmitters and receivers have urged that their product is in many respects better than that turned out in the Bell factory. As might be expected, these claims have been vigorously opposed by the Bell manufacturers and operating companies alike, who have repeatedly stated that their appliances are the best made in the world.

An interesting side light is thrown on this important matter by a statement which is authentically reported to have been made at Providence, R. I., by the attorney of the local Bell company, while opposing the attempt of the Independent company to gain a franchise. This public statement was to the effect that although it is true that the local Bell company is compelled to use the instruments furnished by the parent organization this fact really works out to the advantage of the local concern. *"If the Providence Telephone Company* (Bell) *owned its own instruments the additional expense would be enormous and a depreciation fund would have to be established in order to meet the expense of instruments being subjected to usage."*

Any practical telephone man is aware that if his transmitters and receivers will not stand up under service conditions the principal expense for maintenance will not be that for factory repairs, but the cost of repeated visits of a trouble man before the difficulty is located, added to the expense of removal and replacement of the defective instruments. If the burden upon the Bell factory is "enormous" what must be the strain upon the resources of the Bell operating companies, due to the increase of their maintenance accounts? How does the use of this kind of apparatus affect the profits of a sub-licensee company, forced by its contract to accept it and put it in service? How does the use of such apparatus affect the efficiency of the Bell and sub-licensee service, given with such a handicap? Is the reason why Bell instruments are worked off on sub-licensees clear at last? Has the astute gentleman from Providence let the cat out of the bag?

PHOTOGRAPHY AND FALSE MODESTY.

THAT a great many telephone men take photographs of telephonic subjects which are interesting and pleasing to look at we know, because we very often see good examples of this class of work. That the men who take these photographs appreciate the fact that their work is valuable to others is by no means as sure. Of course a photograph of some piece of telephone work must have a certain number of definite qualities to be of interest to a telephone man. It is necessary that it should do more than excite some such comment as "That's a pretty picture, with a telephone pole in it," leaving him to pass on to the next. There must be something about that pole that would hold a telephone man's attention, if he were on the ground and saw it standing under its load of wires, or the picture will be not worth the taking. But let there be some one such quality, and it does not matter much what it is. The pole may be remarkably straight, or wonderfully crooked, or bent by the stress of the weight it carries to a degree which would seem to make it impossible for it to stand entire; it may even be broken. Even outside the thing itself there may be some feature which will attract and hold for a time the observer's attention. There may be some element of novelty in its location, something extraordinary in its environment. After all, the novelty is the thing. It is always the new object that most quickly draws our attention. Getting back to the personal application, it seems that where the average man fails to see the possibilities of using photography for the benefit of others is that he does not understand the true significance of this element of novelty in objects. It passes from him quickly, sometimes even before he has learned wherein it lies. It is a pretty good thing to not let these novelties pass away uselessly. There are a great many people who enjoy them hugely, and cannot be satisfied. One that is lost is a real deprivation to such keen minded persons. Whenever a telephone man sees something new to him he can do no better service to his friends in the business than to catch its image with his camera, and pass it along.

Of the telephone men who are interested in this subject of photography there are a very large number who are rather inclined to frown on their own work. Another man's eyes are to them an unknown quantity. While they know their work looks good to themselves they are too much afraid that weak spots will be found if it is shown. Perhaps there will be a few shown up, in that event, but the worst that is possible is a criticism that may lead to future improvement. After all, that is more to be sought than avoided. And it is a poor kind of a fellow who is unwilling to pass a good thing along because, in spite of the fact that it will give pleasure, one or two flaws may be apparent. The desire to show only that which is perfect springs from a rather cowardly sort of pride; also, it has been the means of keeping many a good bright light closely hidden.

This subject of photography of things having a bearing on telephone work is one in which THE AMERICAN TELEPHONE JOURNAL takes a very hearty concern. It believes that the camera should be used far more than it is now for the purpose of making records which will save time and money to operating and manufacturing companies. In the training of new employees to accomplish things in a neat and workmanlike way it also has a large field. THE AMERICAN TELEPHONE JOURNAL publishes every year a great many photographs having a bearing on this line of thought, and would like to publish more if it could obtain the right kind—the kind that in themselves tell a story of something new or something worth knowing. It would be glad to have every telephone man in the country who has ever taken a picture that looked good to him when it was first made send to this office a print. If this were done the number that would be found worth publishing—and, incidentally, worth paying for, too—would probably surprise both the takers and the editor; and wouldn't they please the subscribers!

HEEDING THE JUDGMENT OF PARIS.

IN the principal city of France, long noted as having the worst telephone service of any large civilized community in the world, there are at last signs of progress. A new director of the government department having control of the telephone system has been appointed. The numerous and urgent complaints of the residents of the city are being given attention Not only is an investigation of the faults of the present service being carried on, but it is said that consideration is being given to the matter of putting the whole plant into a condition which will make it conform to the best ideas of modern telephone practice.

If this movement is genuine the next news from it is likely to be that the new director is investigating the model telephone systems in some of our American cities.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

AMOUNT OF DAMAGES AN ABUTTING OWNER MAY RECOVER.

How much damages can a man that owns a lot along the street where we are building our line recover? A very obstreporous old German asks five hundred dollars before he will permit us to put up our poles past his property. All there will be in front of his lot is one telephone pole, and we do not see how this can in any way damage him to the extent he claims. The total value of his property is not over two thousand dollars. S. B. C.

IF there has been no wanton or malicious motive in the location of your pole, or disregard of the rights of the abutting lot owner, your German friend would only be entitled to nominal damages. This would be the difference in the value of his property before the construction of the line and its value afterwards if the depreciation in value has been caused by the erection of the poles. We do not see how the erection of a telephone pole in front of a lot could make a difference of twenty-five per cent. in its value. It would seem that $25 ought to cover all the damages done to the property unless there are some special facts of which we have not been informed. By this we do not mean that $25 would be merely the nominal damages., We think it would be giving him a good deal more than he is entitled to, but some allowances may always be made to appease the wrath of those who are apt to make trouble. The danger of paying one lot owner is of course that you may thereby be compelled to make payment to many others.

ENFORCING CONTRACT FOR RATES.

We notice that you have several times in the columns of THE AMERICAN TELEPHONE JOURNAL stated that a contract between a municipality and a telephone company fixing the rates at which the company should give service was without consideration and could not be enforced by the municipal authorities in the courts. Would this principle hold true in a case where we solicited the contract and obtained considerable advantage in our use of the streets, by agreeing with the city to give a certain fixed low rate? The city authorities say that the contract was beneficial to us and inconvenient to the public, and we should thereby be held to the rates fixed in the franchise. F. M. E.

WHERE a franchise fixing rates is a contract without consideration it is so because of a lack of authority on the part of the municipality to determine rates. This lack of authority is fundamental and cannot be supplied by the fact that the city, in ignorance of its authority, granted the company a more advantageous franchise than it would otherwise have done. The lack of authority makes the rate feature of the franchise void from the beginning, and the contract cannot be enforced under any circumstances. This is not true for all States, but is the law of Ohio, where we understand the above question arises.

WHEN IS A CORPORATION DOING BUSINESS?

THE statutes of Missouri (Rev. St. 1899, Sec. 1024, 1025) provide that a foreign corporation, before it shall be authorized or permitted to transact business in the State, shall maintain an office, file a copy of its charter, etc. This section also fixes a penalty for any such corporation doing business without such requirements and denies it the right to sue in the state courts upon any demand, whether arising out of contract or tort. A corporation known as the Hanamo Telegraph and Telephone Company was incorporated in the State of Delaware. A board of directors in Missouri authorized the company's president to sell certain portions of its capital stock, and he sold certain shares of the stock and received a promissory note in payment for them. This note he sold to a bank and the bank brought suit to collect it. The defense in the suit was the statute first quoted as the court held that the contract of a foreign corporation doing a forbidden business was void. The court did not apply the statute to the case in question however, because it held that the "doing business" referred to by the statute is a transaction of the business for which the company was incorporated and did not include the sale of its shares by the telephone company so as to render the note void. Judgment in favor of the bank was sustained. First National Bank vs. Leeper, 97 S.W., 636.

INJURIES TO CHILDREN PLAYING IN THE STREET.

A JUDGMENT against the Michigan State Telephone Company for damages for injuries to a seven-year-old child who was hurt while playing in the street where the company was erecting its line, has been affirmed by the Supreme Court of the State of Michigan. The injury happened in the City of Grand Rapids. A little boy was playing in front of his father's house with other children. While so engaged a wagon of the telephone company, with a number of employees, drove up. The men proceeded to unload and throw upon the ground reels, ropes, snatch blocks and other equipment, preparing to string a cable on poles. The children at once began to roll the reel upon which the lead-rope was wound. While so doing, one of the company's workmen told them to keep away. A snatch-block was then attached to an anchor-post in the street and a rope was run through the block to draw the cable to the cross arms of the poles. The children continued to play about the anchor-post, which was left unguarded, and the little boy took hold of the rope which was passing into the snatch-block, and his hand was drawn in with the rope and crushed. The company's defense was that it was not negligent; that the boy was guilty of contributory negligence and was a trespasser. The court held that the boy was not a trespasser in the sense that he set in motion the agency which caused his injury. The question whether the company's workmen were negligent in leaving the snatch-block unguarded and not giving the children proper warning of the danger of playing with the rope, was held to be for the jury. It was also for the jury to determine whether the boy was capable of sufficient understanding to render him guilty of contributory negligence. The case was hotly contested in the Supreme Court, and resulted in two of the jurors dissenting from the opinion of the majority.

O'Leary vs. Michigan State Telephone Co., 13 D. L. N. 752.

ATTEMPT TO OUST CUMBERLAND COMPANY FROM MISSISSIPPI.

QUO WARRANTO proceedings have been begun at Laurel, Miss., to oust the Cumberland Telephone & Telegraph Company from the State. This action follows an alleged overcharge of rates authorized by the Mississippi Railroad Commission. The company has been charging subscribers in Laurel at the rate of $3 per month for direct business lines and $2 per month for direct residence lines. It claimed that this is 25 cents and 35 cents per month, respectively, in excess of the maximum permitted by the State Railroad Commission. It is estimated that the telephone company has collected not less than $1,000 in tolls said to be unauthorized.

QUERIES

KICK COIL TELEPHONE.—(820.)

THE following letter from the general superintendent of a telephone company in New York State brings out some new points in the discussion of kick coil telephones which was started in response to a recent inquiry from a subscriber:

"I note the vigorous 'kick' your correspondent makes on the kick coil telephone, and that he has failed to mention one of the greatest disadvantages in the use of this apparatus. While the kick coil telephone will work very satisfactorily when the batteries are new, it is decidedly defective after the user has talked for five minutes or more, and then tries to get central again. During this time the internal resistance of the batteries will have increased so much that enough current can not be obtained to charge the coil sufficient to throw the drop shutter at central.

"Then again, the high voltage of the current makes the kick coil telephone impractical for party lines, particularly farmer lines where several instruments are installed, as the current from the coil is absorbed by the ringers nearest the coil, while the drop gets very little, usually not sufficient to throw the shutter.

C. D. W., N. Y."

PULSATING OR ALTERNATING CURRENTS IN A TELEPHONE LINE.—(821.)

Perhaps you can help me in an argument through the queries column of your valuable journal. I say voice currents on a telephone line are alternating currents. My friend says they are pulsating. Can you tell me which kind and why? Are not all induced currents alternating?

R. P. H., Conn.

YOU win, the currents emanating from the secondary of an induction coil and traversing the telephone line are alternating currents. Further all induced voice currents are of an alternating nature.

In order to appreciate the reason for this it will be necessary to first consider the truth in relation to magnetism, i. e., that when a conductor is moved across a magnetic field so as to cut lines of force an E. M. F. is generated in the conductor, which is proportional to the rate at which the lines of force are cut. The motion between the conductor and the lines of force is relative and the rate of the cutting depends upon three things: the intensity of the field, the velocity of the motion and the direction in which the cutting occurs.

Further, when a current of electricity is traversing a conductor lines of force encircle the conductor having a definite direction in relation to the direction of the current. Their magnitude is dependent upon the strength of the current flowing through the conductor.

We will assume that in figure 821 *a* represents a conductor bearing a current of five amperes, and *b* a conductor carrying a current of ten amperes. We have represented the lines of force surrounding each wire by the light lines around the conductor, indicating their direction by the arrows.

As to the increase in magnitude of the field included by the lines of force, as the current is gradually increased from five amperes to ten amperes we will liken their transition to the wave rings seen when a pebble is thrown into a pool of water. However, when the increase of current ceases, the building up of the lines of force likewise stops. So the lines of force remain stationary so long as the current remains constant.

We will now suppose the current in the conductor *b* to be lowered from ten amperes back to zero and imagine the lines of force to retreat to the wire and there disappear.

We will now place another conductor in juxtaposition to the first and note the phenomenon that will occur. This arrangement we have depicted in diagram *c*. The first conductor we will call the primary and the other the secondary. Then as we increase the current in the primary, lines of force will be thrown out and cut across the secondary. Having in this case a relative motion between the lines of force and the secondary circuit, you will note that a current is generated in the secondary, the direction being opposite to that of the primary. This is described as an induced current, the process being called induction.

As before stated, induction takes place only so long as lines of force are being cut or as long as there is a constant change in the strength of the primary current. As soon as the current in the primary reaches its maximum and remains at that value then the lines of force assume a definite position, become stationary and no longer cut across the secondary. The E. M. F. in the secondary then becomes zero and so remains until the strength of the primary current is changed.

We now decrease the current in the primary from its maximum to zero, and we have lines of force again cutting across the secondary, as shown in diagram *d*. You will note that the lines now cut across the secondary in a direction opposite to the previous illustration, establishing an E. M. F. in the same direction as in the primary.

This shows us that the effect of the current in secondary in the first case is to resist the piling up of the lines of force and in the second tends to keep up the primary current.

Inasmuch as the changes in value of the primary current of an induction coil in connection with a telephone are so very rapid you will readily see that the result in the secondary would be a rapidly alternating indirection.

As to the manner in which the low voltage of the battery is transformed to higher potential in the coil, that is another story which we would be pleased to tell you here could we but find the room. However, you will find it ably handled in any standard work on telephony.

Training Young Telephone Men

WRITING of the course of training which he thinks best adapted to fit a young man for successful work in his department, William Allan, chief electrician of the exchange at Glasgow, Scotland, offers in the *National Telephone Journal* some suggestions of which the following may be interesting to many people on this side of the water:

The first essential is that only the right class of young men be accepted for training in the department. It may be admitted that it is extremely difficult to know how the youth fresh from school will turn out; but it is the youth whose mind has shown a bent towards mathematics and mechanics who will most likely best repay time and trouble spent in training for telephone work. It must always be borne in mind also that although the sound mind, and the right kind of mind, is an important consideration, the sound body is also of consequence; a lad of weak constitution is certainly not the one who should be started on a career as a telephone electrician. In addition to a searching inquiry as to character and early training, there should be an entrance examination specially designed to test the progress already made, more particularly in mathematics, and unless he is found capable of answering, with an efficiency of say 90 per cent. some simple questions in arithmetic and algebra (as far as simple equations) he should be disqualified. A satisfactory school certificate might be accepted as sufficient proof of general education. No one under sixteen years of age should be accepted under any circumstances.

When candidates have been accepted they should be placed under the control of a special officer, whose duty it would be to watch the career of these young men in all sections through which they pass, and from time to time to test by special examination the progress they have made; he should also direct their studies in technical classes. Although examinations are apt to become more or less stereotyped and hardly show the full capabilities of any candidate, still they may be made to give sufficient indication (along with other sources of information available) to enable one to judge whether a lad is likely to be worth further expense in his special training.

The special training officer should have a properly equipped workshop assigned to him, in which the boys would be under his control during the first six months of their training. There they should have a thorough drilling in the best methods of handling tools, and they should be shown how to take all classes of apparatus to pieces, the practical use of each part being explained. It might be possible to get a little remunerative work done by them during their term in this shop by letting them handle recovered apparatus and take it apart for the purpose of demonstration; then before re-assembling it let them clean up the several parts, so that the apparatus could be re-erected when required without further labor being expended on it; it should be made quite clear, however, that the matter of first importance throughout the time of training is not so much to get remunerative work done by the learners and save some other classes of labor, but to see that they are thoroughly instructed in the proper use and handling of apparatus and tools. While the lads are in the training officer's workshop he will be reasonably able to say at the end of six months whether any of them should no longer be retained in the service, as he will have had an excellent opportunity of becoming thoroughly acquainted with their qualities.

At the end of six months the boys should be placed under an an experienced instrument setter (specially chosen for his personal character and efficiency) and sent round with him to gain an insight into the proper methods of setting instruments, giving such assistance as they are able. At the end of three months the training officer would put them through a practical test of this section of the work, certifying whether satisfactory knowledge had been gained, or if longer time should from any special cause be given to this section.

The lads would then be passed on to the switchroom, where for six months they would be placed under a first-rate construction man (again specially chosen, as in the case of the instrument setter). Here they would have an opportunity of watching the methods of erecting and wiring switchboards, testboards and power plant, doing little practically themselves, but rather seeing how the work is done; then during another six months they should be set to the actual handling of cables and erecting of apparatus, care being taken to see that they gain skill in following the connections from diagrams. As switchboard apparatus and wiring are so much more complicated than any other part of the plant, the full twelve months will probably be the very shortest time advisable to allow on this section. When this time has expired their knowledge will again be tested by the training officer, who will certify the progress made and the necessary action to be taken in case it should prove unsatisfactory. Assuming that the progress to this point is found satisfactory, the lads should then be sent back to the switchroom for another six months and set to the clearance of switchboard faults, their nature, probable cause, and the best method of localizing and clearing them being carefully explained to them by whoever is in charge. From this duty they should pass to the testroom where they will be initiated into the ordinary routine work of testing, the use of instruments for making insulation and other tests, and the keeping of records and checking the work of inspectors and troublemen. At this point they would come more specially in contact with subscribers, and care must be taken to instil into their minds a proper idea of the line of conduct in speech and manner, which it is expected representatives of the company should follow in their dealings with the company's clients. After three months thus spent, they should have six months on instrument faults; here they will, for the first time, be left more or less to their own resources, and at this time instructions should be very carefully given in all that pertains to the relationship between the company's employees and the telephone users. A comprehensive test of all-round knowledge and capabilities of the apprentices should then be made by the training officer, and it would be his duty to report whether the young men were now fully qualified for entry on the permanent staff of the electrical department.

Throughout all these stages, if the training officer should certify that at the end of the specified period proper and reasonable progress had not been made, it should be clearly understood by the apprentices that they must lose any increase in pay which might apply at the end of such period, remaining at the lower rate until able to qualify for passing to the next stage.

The course of practical training suggested may be summarized as follows:

In the workshop	6 months.
With experienced instrument setter	3 "
In the switchroom	18 "
In the testroom	3 "
On instrument faults	6 "
Total	3 years.

In addition to the practical training, the apprentices would be required to attend such suitable classes as might be available, or to take correspondence courses of a suitable character to give them a knowledge of mathematics and electrical theory.

The success of any such scheme as has been outlined must depend, first, on the care taken in passing candidates to make sure of obtaining the proper type of lad; second, on the choice of the proper man for the position of training officer; and third, on the choice of the best men available, in each section of the work, under whose control the lads will be placed at the successive stages. In each of these cases the warning to "choose well, your choice is brief yet endless" should be well heeded.

In the satisfactory working out of the scheme the training officer would have the most influence, as he would come in touch with the lads at the end of each term when examining them on the progress made, and it would be well that he should

Digitized by Google

also, while the classes are in session, supervise their studies by meeting them at least one evening in each week, when any special points requiring explanation might be brought up and difficulties cleared away. The young men are at an age when example has more to do in moulding their characters than any amount of precept. The instilling of knowledge into their minds will be best done by offering it in such a way as will make them eager for more, rather than by endeavoring to force dry hard facts, as it were, down their throats without any attempt to make the dose palatable by offering it in such fascinating guise that their attention will always be held. This may be done where the instructor is himself interested in his work, and has sufficient enthusiasm for it as to make all he says and does both interesting and instructive.

ROONEY VS. GREEK.

IN the early fall last year a number of Western Reserve University students at Cleveland rented and equipped a house near their college and after christening the new abode, as is customary, with certain letters of the Greek alphabet, they decided to have a telephone installed.

A few days following Line Foreman Rooney received an order which read as follows: "Alpha Delta Phi, 153 Cornell street." He accordingly reported by telephone to the construction clerk, saying:

"I'm going on that Alfred Pic house nixt."

"All right," replied the clerk, laughing. "Call in when the line is completed."

A few hours later Rooney again called:

"I've finished that Cornell street order an', Oi say, phwat do ye think, that's a place phere the college byes stop at."

"Yes, of course," answered the clerk. "What did you suppose it was?"

"Begorry," replied Rooney, "I was after thinking it were a Chinase laundry!"

PLEASANT ENTERTAINMENTS BY TELEPHONE EMPLOYEES IN CINCINNATI AND NEW HAVEN.

EMPLOYEES of the telephone companies in Cincinnati and New Haven are the latest contributors to the list of interesting entertainments by telephone people.

In Cincinnati an entertainment was given on January 30th, and repeated on the two following days, by the telephone company for its operators and other lady employees. A very interesting program was prepared, including several pleasing and amusing songs, a one-act play, etc. The most novel feature of the entertainment was a bag striking match between "Sis" and "Feathers," two operators who have developed their skill in this art in the rest rooms connected with the company's exchanges, which are all equipped with striking bags. The audience was greatly delighted by this unusual "stunt."

At New Haven the telephone employees, as a preliminary to dancing, gave an entertainment on January 25th, in which the more serious numbers were the songs by men connected with the company.

The second part consisted of "A Bunch of Musical Nonsense," entitled "Trouble in a Darktown Exchange." Inside the cover of the program, which was sent us by our correspondent, are written a few words indicating the opening of the entertainment as follows: Operator said "Hello, hello, hello, what number? Fouah, double one, double fouah! What you think this is, a policy shop? Dis am de Darktown Telephone Exchange."

TEXAS INDEPENDENTS TO MEET AT FORT WORTH.

THE Texas Independent Telephone Association will meet at the Exchange Building of the Fort Worth Telephone Company, February 21st and 22nd, the date of meeting having been changed from March 21st and 22nd on account of the proposed legislation by the State of Texas.

It is deemed advisable to take up each individual bill and discuss its objections or merits, and then appoint a committee to go to Austin and lay the matter before the legislative committee.

The most important bill now pending is "An Act to regulate telegraph and telephone companies after the manner of common carriers, requiring competing companies to receive and transmit messages to each other's line by the installation of joint service facilities between local and long distance points, and requiring companies to accept and transact business on the clearing house principle."

Another bill under consideration places a three per cent of gross receipts tax on telephone companies, while a third bill makes the limiting rate for residence telephones, in cities of over 30,000 people, $1.50 per month; a certain class of business telephones, such as lawyers, offices, etc., $3, and other classes of business, $5.

The third bill makes it unlawful to charge more in one place for service than in other towns of the same size.

The manufacturers and supply men represented in Texas will provide for the entertainment on the evening of February 21st.

BILL TO PLACE INDIANA COMPANIES UNDER RAILROAD COMMISSION.

A BILL has been prepared by a member-elect of the Indiana Legislature, for presentation to the next session, to make telephones common carriers, and place them under the jurisdiction of the Railroad Commission. Mr. Bowser, the member, states that telephone conditions in Northern Indiana have suggested to him the need of such legislation.

A CARD SYSTEM FOR NUMERICAL LISTS.

BY SCOTT B. WILLIAMS, AUDITOR, THE TEXARKANA TELEPHONE COMPANY.

NUMERICAL lists are kept for the purpose of enabling the manager to know at the close of any day just what numbers are vacant, and to give a record of each switchboard number which will furnish informatiton in a form for ready reference so that at any time one may know the name of each subscriber, street address, and date the telephone was installed on any number.

The writer has designed and is now using a card system for the numerical record. The card is printed as shown in Fig. 1. It is 3x5 inches in size and may be of any color. It is well however to have it of a different color from cards used for other records in order to prevent confusion. These cards are of course filed numerically in a regular cabinet card section, with guide cards used to separate them into groups of fifty units.

When a telephone is put in, after the order has been returned to the bookkeeper, as explained in a previous article published in AMERICAN TELEPHONE JOURNAL, issue of October 6, 1906, a numerical card is filled out and filed in its proper place. If the number is afterward discontinued the date is entered on the card in the space provided, and the card is then put in a transfer file arranged just like the working file. Disconnects and connects are shown on the card, and can be easily picked out of the file by putting a small strip of cardboard just in front of and a little above the card. After making the proper entries in the numerical list the order is marked O. K. with the initials of the clerk in the proper place and is afterward entered in the street list.

TELEPHONE PATENTS

TESTING SYSTEM.

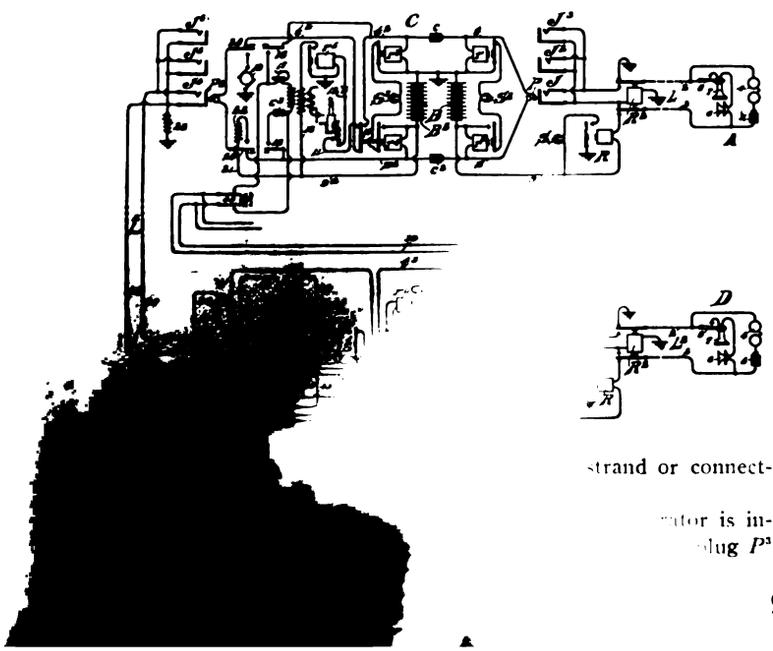
William W. Dean, Chicago, Ill., patents (No. 838,525; dated, Dec. 18, 1906; filed June 29, 1903; serial No. 163,616) and assigns to the Kellogg Switchboard & Supply Co., Chicago, Ill., a testing system.

This invention covers a method of connecting the common portion of a busy testing-circuit to the testing strand of an operator's cord at the time when it should be used for testing.

The illustration shows the system as applied to both a subscriber's and a trunk operator's cord circuits. In the upper cord circuit, for use by a subscriber's operator, tip strand t^2 of the cord circuit is normally open and its forward portion is connected by spring 10 of the supervisory relay r^4 with conductor 11, leading to a normally open contact of the plug-seat switch in which the calling plug P^2 normally rests. From this switch, conductor 12 extends to the high impedance test relay r^5, the opposite terminal of which is grounded. This relay controls, through its normally open contacts, a path for current from the battery B^2 over conductors 9*a* and 13, including the tertiary winding of the operator's induction coil.

In the trunk circuit shown at the bottom of the illustration, relay 9 is associated with the trunk. Spring 35 of this relay is connected with the forward portion of the strand t^3 of the trunk cord, and normally engages with a contact connected with conductor 36, leading to a plug-seat switch in which the trunk plug P^3 normally rests. This switch is connected by conductor 37 with one pole of test relay r^{11}.

In the operation of the system in connection with the subscriber's cord, the line is tested by means of the calling plug P^2. The current will flow from the test-ring of the wanted line, if the line is busy, over tip-strand t^2 of the cord-circuit tip-spring 10 of relay r^4, conductor 11, plug-seat switch contacts, which are now closed owing to the absence of the plug, and conductor 12 through the test relay r^5 to ground. The relay is operated and causes a click in the operator's telephone. Upon the insertion of plug P^2 supervisory relay r^4 is operated to cut out test relay r^5, and it is not again connected with the cord circuit during the connection. The operator's telephone may therefore be connected



strand or connect-

ator is in-

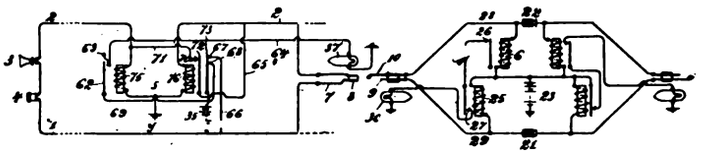
lug P^3

in the usual manner. Test relay r^{11} is connected with the strand t^3 through contacts of the plug seat switch. When the plug is in its seat, the test relay is isolated from the trunk cords. The insertion of plug P^3 closes the path for current from battery B^3 over the sleeve-strand of the cord circuit, thereby actuating the cut-off relay R of the line L^3. Relay r^9 is likewise operated, and serves to disconnect the conductor 36 of the test relay and to complete the tip strand t^3 for conversation.

It will be evident that in both cases the test relay, which is common to cords at an entire position, is disconnected and wholly isolated from the circuit except when a cord is being used for testing.

TELEPHONE SYSTEM.

Gottlieb Magnus Teodor Piltz, Stockholm, Sweden, patents (No. 838,809; dated, Dec. 18, 1906; filed August 4, 1903; serial No. 168,148) and assigns to Stockholms Allmänna Telefon Aktiebolag, Stockholm, Sweden, a telephone system.



This patent covers a telephone system comprising two relays, one of which, 75, is included between the subscriber's station and the central battery, and the other, 76, between the battery and the spring jack. Relay 75 is energized to control the line signal when the subscriber calls the exchange, and relay 76 is operated when a plug is inserted in the answering jack. One effect of the operation of this second relay is to join the two relays in parallel, in which condition they together serve as an inductive resistance in connection with one side of the line, as is necessary for the proper working of the system. The corresponding inductive resistance for the other side of the line is furnished by a supervisory relay in the cord circuit.

INTERRUPTER FOR ELECTROMAGNETS.

John Erickson, Chicago, Ill., patents (No. 841,004; dated January 8, 1907; filed February 3, 1906; serial No. 299,326) and assigns to the Automatic Electric Company, Chicago, Ill., an interrupter for electromagnets.

This invention covers an inerrupter of improved construction for enabling a rotary magnet of a telephone selector in an automatic exchange to interrupt its own energizing circuit, and to continue this action as long as the circuit remains closed at all other points, whereby the selector automatically continues in operation until it finds an idle line. The claims cover the construction of such a piece of apparatus.

GROUND ROD.

Charles Lanz, Knoxville, Pa., patents (No. 837,693, dated Dec. 4, 1906; filed Oct. 10, 1905; serial No. 282,159) a ground rod.

By a method described in this patent there is provided a ground rod having near its lower portion a permanently connected wire which may be attached above the surface of the earth to any suitable wire forming a part of a telephone circuit.

In forming this connection the inventor proposes to wind a length of wire around the rod near the end which is to be driven

Digitized by Google

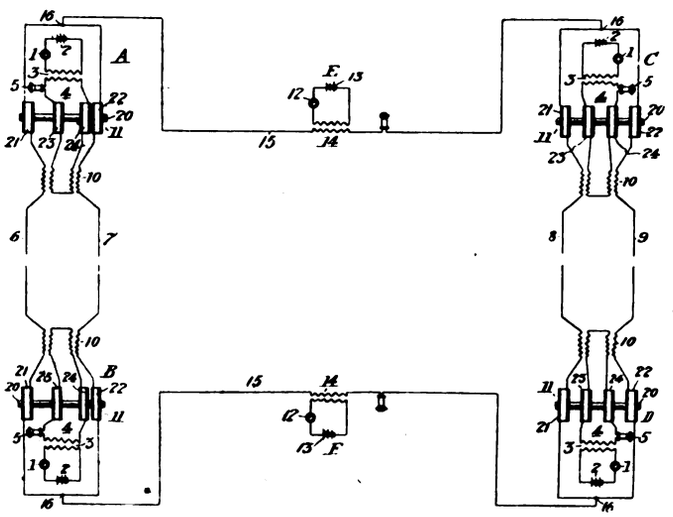
PATENTS—Continued.

into the earth, apply below this winding a cup-shaped disk, and then dip the whole into spelter. On withdrawing the rod in a vertical position, it and the wire coil will be thoroughly galvanized and also the spelter will have united the coiled wire to the rod in a manner which insures a proper electrical connection. The spelter forms a thick coating over the coil, thus forming a connection which cannot accidentally be torn loose.

PHANTOM SYSTEM.

Thomas P. Jordan, Dallas, Texas, patents (No. 838,028; dated December 11, 1906; filed October 3, 1904; serial No. 292,588) and assigns to E. H. Cary, Dallas, Texas, a phantom telephone system.

The object of this invention is to provide a means for pre-



venting cross talk between a phantom circuit and the main line circuits of which it is composed.

In the illustration, *A*, *B*, *C* and *D* designate four stations equipped with substation sets of the usual type. The main lines are designated by figures, 6-7 and 8-9, respectively. Induction coils 10 give facilities for the transmission of speech between the secondaries of the substation talking sets and the main line. In addition to these induction coils there is employed a second set, 11, of special construction having two fixed spools, 21-22, to which line wires are connected and two movable spools 23 and 24 connected in the secondary circuit. These movable coils 23 and 24 may have their positions changed in order to vary the distance between them and the fixed coils and, consequently, the inductive action between the two sets of coils. In this way the circuits are to be balanced up so that cross talk between the main line and the phantom formed by connections taken off at points 16, may be avoided. Repeating coils 10 are to be used in order to increase the efficiency of the apparatus.

PARTY LINE INDICATOR.

Charles Kenney and Robert H. Leather, of Philadelphia, Pa., patent (No. 834,208; dated Oct. 23, 1906; filed April 25, 1904; serial No. 204,862) a telephone system.

The object of this invention is to provide means which will indicate at the central station the number of any particular subscriber on a party line who makes a call, and this is designed to be automatically accomplished without further action by the subscriber than the lifting of the receiver from the hook. Upon receipt of a call the operator may connect to the line a battery in series with the magnet of a register having an ammeter mechanism. Bells at different instruments on the line are intended to have graded resistances, so that the amount of current flowing through the register will be different for each station, causing the needle to point to the proper division on a dial marked to correspond to the individual stations which may send in a call. A modification of the invention provides a means whereby the registration is automatically effected without the performance by the operator of any action in addition to that necessary to answer a call.

TELEPHONE SYSTEM.

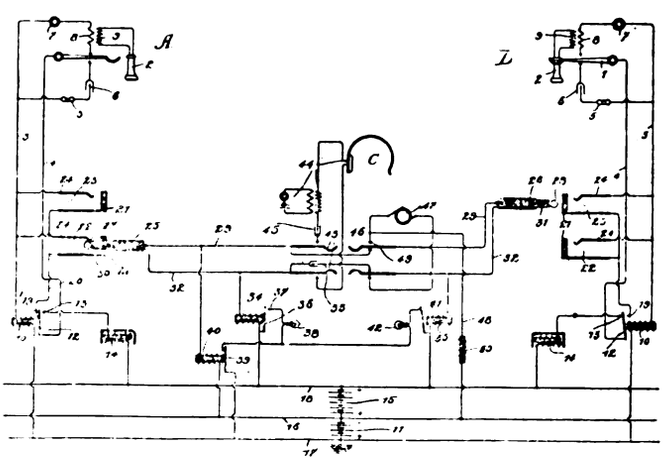
W. W. Dean, Chicago, Ill., patents (No. 833,733; dated October 23, 1906; filed December 23, 1902; serial No. 136,333) and assigns to the Kellogg Switchboard & Supply Company, Chicago, Ill., a telephone system.

The object of this invention is to do away with the use of separate line and cut-off relays in the subscriber's line circuit. In order to accomplish this the inventor uses a consequent pole relay to control the line signals. This relay is arranged with a winding in each of the line conductors, one of these windings having a high resistance, say 1,000 ohms, and the other wound with a low resistance, say 100 ohms; the number of turns in both windings is preferably made equal. When a call is made from the sub-station the calling current passes serially through the two windings producing equal fields of force, which serve to attract the armature to the consequent pole and illuminate the line signal. When the call is answered by the operator the high resistance winding of the relay is shunted by a low resistance supervisory circuit. Under these conditions the field of force produced by the 1,000-ohm winding will be so much less than the field of force produced by the 100-ohm winding that no consequent pole is produced, and the armature will fall back.

EXCHANGE SYSTEM.

Harry G. Webster, Chicago, Ill., patents (No. 840,726; dated January 8, 1907; filed May 28, 1903; serial No. 159,118) an exchange system.

Line limb 3 extends through the winding of cut-off relay 10, and thence to the positive grounded pole of the battery. Line limb 4 goes to armature 12, through contact 13 and line signal 14, and thence to the negative pole of battery. The cut-off relay 10 is wound with a low resistance coil, requiring a heavy current for its actuation, while the line signal 14, having many turns of fine wire in its coil, responds to a small current. Therefore, when the subscriber removes his telephone from the hook, line signal 14 is operated and relay 10 remains inactive. When, however, the operator plugs into the jack to answer the call, she closes a circuit from the bus-bar 16 through supervisory con-



trolling relay 40, which has a low resistance, tip strand 29 and thence through cut-off relay 10 and back to bus-bar 17.

This sends a comparatively large current through the cut-off relay, owing to the low resistance of relay 40 and the cut-off relay 10 is operated, disconnecting the line signal and connecting line limb 4 directly with the sleeve contacts 21 of the associated line jacks.

HARTFORD, CONN.

OUR '07 CATALOGUE SENT ON REQUEST

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE—1,000 Kellogg magneto telephones; Viaduct Mfg. Co. ringers; Wabash Cabinet Company's back boards and battery boxes. Good condition, almost new. Will sell singly or in lots. For particulars, write Kinloch Telephone Company, C. W. Shands, Purchasing Agent, St. Louis, Missouri. 755

FOR SALE—At half price, one hundred forty American Electric four-party, selective, ringing telephones. First class condition—most of them as good as new. Address Zenith Telephone Co., Duluth, Minn. 762

FOR SALE—Fisher Cable Testing Set, high sensibility galvanometer, 100000 ohm coil, Ayston shunt, ½ mf. sub-divided condenser, Wheatstone bridge. Original cost $485.00. Will sell at a bargain. J. W. Wright, 1304 Arch street, Philadelphia. 766

FOR SALE—Telephone plant in northwestern Indiana, operating 200 city and one hundred eighty-five rural telephones. Good rates and franchise. For particulars address W. W. Washburn, Goodland, Ind. 771

FOR SALE—100 line American Electric switchboard. First-class condition. Cheap. Can ship about March 1st. Address Box 776, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 776

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

WANTED—Trouble shooter and lineman. Must be good workman and straight. $50.00 per month straight time. Address Box 775, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 775

WANTED---Continued

A GOOD opportunity for a young man with executive ability and thorough knowledge of telephone circuits, battery instruments in particular. Address Box 770, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 770

WANTED—Married man with five years' experience desires position as manager or troubleman. Three years with present company. A-1 references. Open March 1. Address Box 772, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 772

POSITION WANTED—An expert mechanic and designer wishes to make a change. Eighteen years' experience in the instrument and telephone lines. Technical training. Telephone engineering, Scranton School. Got the habit of "delivering the goods." Address Box 773, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 773

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

OPENING OF NEW ERICSSON FACTORY AT BUFFALO.

ANNOUNCEMENT has been made of the opening of its new factory at Buffalo, N. Y., by the L. M. Ericsson Telephone Mfg. Company. The booklet in which this information is given, from the design upon its cover to the arrangement of its inner pages, is exceptionally interesting and attractive, giving evidence of the highest care and skill in its preparation.

The company has stated its intention of using this new factory for the production of the highest grade of telephone apparatus. All preparations for this work have been made in the past twelve months, during which time the building has been completed and equipped with machinery selected from the markets of the world for its suitability for the economical production of high grade telephone apparatus.

The agency for this company's products, formerly made in Stockholm, but widely sold in this country, which has since 1897 been in the hands of Messrs. Smith & Hemenway, of New York City, has been by mutual agreement discontinued. All American orders for new equipment, and for renewals of old material, are hereafter to be handled by the company's Buffalo offices.

In the announcement of its policy, signed by Axel Bostrom, president, and Klas Weman, manager, it is stated that although an American company has been organized, and suitable modifications in the construction of the apparatus have been made to conform to American standards, the production of the company's own devices from its special designs and made with the same high degree of workmanship which has characterized the products of its Stockholm factory, will be continued in its new plant. The new organization is strictly independent of connections with any other concerns, and it is now ready to handle all orders and inquiries concerning its telephones and telephone supplies of all classes directly from its factory at Buffalo.

THE EWING-MERKLE ELECTRIC COMPANY, St. Louis, Mo., in the January number of its *Everbest Magazine* has the usual number of bright little articles and a number of electrical specialties are described. The company will send this book free of charge to interested persons.

THE AMERICAN ELECTRIC FUSE COMPANY, Muskegon, Mich., has prepared, in its catalogue No. 31, a very complete and interesting list of supplies for the protection of telephone circuits at various points. The field is completely covered, from the distributing frames at the central offices to various types of assembled panels and protectors for cable terminals, and the latest type of protection for the subscriber's station. The book contains information which is exceedingly well arranged, and the illustrations give a very good idea of the appearance of the apparatus. The company will be pleased to send this book to interested persons who ask for it.

THE TRUMBULL ELECTRIC MFG. COMPANY, Plainville, Conn., has just issued a very attractive folder showing several types of its well-known switches. Attention is called to the special features which have won such favorable notice for the Trumbull switches, among which may be mentioned the self-adjusting clips, which are set in recesses in the porcelain base to prevent turning; raised binding contacts for convenience in attaching wires, and other important details of construction. It is well known that the reliability of a switch is largely determined by the care with which the parts are assembled, and with regard to this point the Trumbull Company puts its case ingeniously as follows: "Our Switches are assembled by *Live Men*, not by Child Labor or Wooden Indians." To those who know the skill of the full grown Connecticut mechanic this would seem to be the final word on the subject.

FRANK B. COOK, 246 West Lake Street, Chicago, Ill., has issued a four page folder describing his new subscribers' station protectors. In this folder, while incidentally reference is made to the protectors sold by Mr. Cook, the greater part of the space is given over to some very interesting statements in regard to the value of protection in general. The possible consequences of failure to adequately protect a subscriber's station are clearly shown by a quotation from a verdict in a recent action for damages, where a telephone company lost heavily owing to its failure to provide reasonable protection. Reports of other accidents, with the amounts of the losses incurred, are given. Telephone companies anxious to investigate the subject of protection can obtain considerable useful information from this printed matter, which may be obtained in response to an inquiry mailed to Mr. Cook.

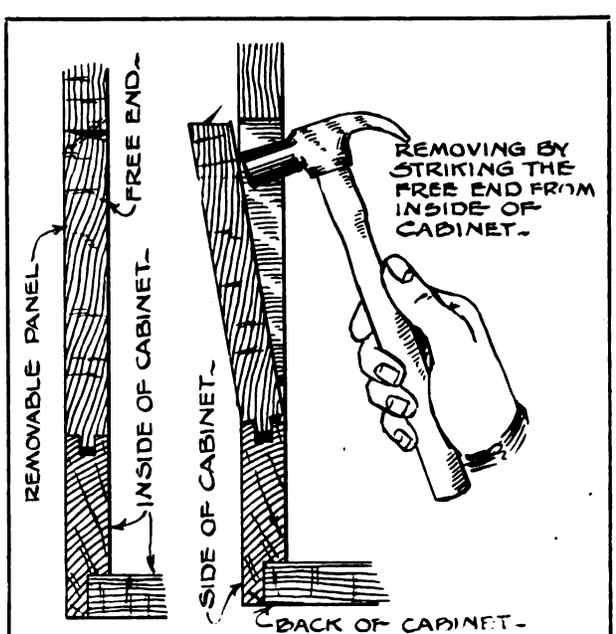

Fig. 1. Construction of side of Dean Express board cabinet, and method of removing panel to allow passage of cable to adjacent unit.

WOODWORK FOR UNIT CABINETS.

STANDARD cabinets for its express type switchboards are made in two sizes by the Dean Electric Co., Elyria, Ohio. One of these has an ultimate capacity of 150 drops, with 15 cord circuits and fifteen lamp transfer circuits, being arranged for a single operator, while a larger size is arranged for two operators with double the amount of equipment contained in the smaller cabinet. While these figures are for the ultimate capacity of a unit, smaller numbers of circuits may of course be installed.

In order to make it easy to establish the desired connections from the distributing racks to the switchboard, and from one unit to another when several are lined up in the operating room, an ingenious arrangement of paneling is provided. The woodwork of the cabinets is quarter-sawed oak put together so as not to warp or crack, and finished in a dark or golden oak. At each side of the unit cabinet is provided a removable panel, and this is normally secured and held firmly in place in the manner indicated at the left in Fig. 1. These removable panels are finished flush with the outer surface of the cabinet, so that up to the time it is desired to remove them they form a part of the regular finished surface.

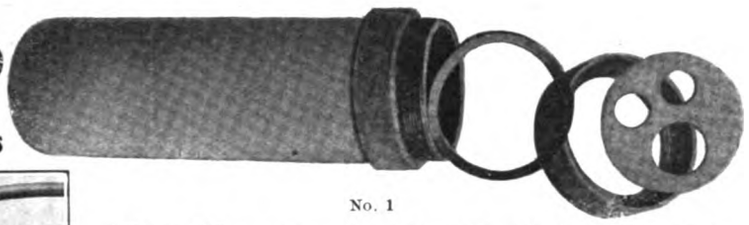
MONEY MATTHEWS TRADE MARK W.N. ESTABLISHED 1899 C.L. SPECIALTIES SAVERS



No. 1

The Hargis Cable Splicing Joint

It is a device for splicing lead cable, quickly, safely, economically, and with a large saving of money.

It is made in three sizes, No. 1, No. 2 and No. 3.

The method of using this money saver will be seen by studying the photographs, 2, 3, 4, 5, 6 and 7.

You will see that it saves cable and solder. It can be boiled out without any waste of paraffine. Pairs can be spliced easily and quickly. In case of trouble along the line it is easy to find pairs and test them out.

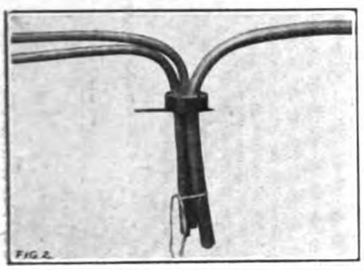


FIG. 2.

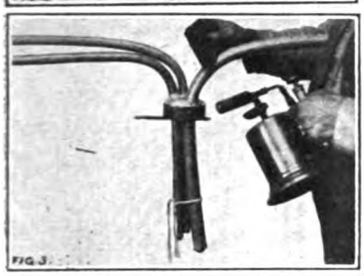

FIG. 3.

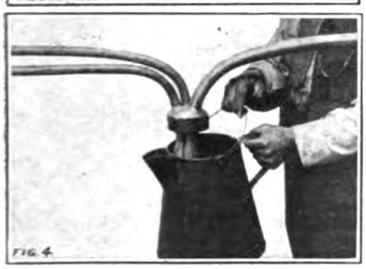

FIG. 4.

SOME POSSIBLE COMBINATIONS

A No. 1 Hargis Joint will take:

50 pair in, 2-50's out.
50 pair in, 50 out and a 10, 15 and 25 pair tap.
25 pair in, 25 out and a 10, 15 and 25 pair tap.
25 pair in, 25 out and a 10 and 15 pair tap.
25 pair in, 15 out and a 10 and 15 pair tap.
15 pair in, 15 out and a 10 and 15 pair tap.

A No. 2 Hargis Joint will take:

100 pair in, 100 out and a 10, 15, 25 and 50 tap out.
100 pair in, 75 out and a 10, 15, 25 and 50 tap out.
100 pair in, 3-50's out.
100 pair in, 2-50's out and a 10, 15 and 25 tap out.
100 pair in, 3-25's out.
100 pair in, 2-25's out and 10 and 15 tap out.
100 pair in, 1-25 out and a 10 and 15 and a 10 and 15 tap out.

IN THE MANUFACTURING FIELD

When it becomes necessary to add an additional section, these panels are readily removed by a stroke of a hammer and the cables may be passed through the opening. In this way a particularly neat piece of work may be done, as it is wholly unnecessary to mar the finish of the board, which counts for much in addition to the time saved by the installer.

For the entrance of line cables and wires provision is made at the bottom of each cabinet. Holes are bored in the woodwork which completely encloses the bottom of the cabinet, and until it is time to use them are closed by plugs. These may be easily driven out and the wires passed through the opening thus made.

THE SANDWICH ELECTRIC COMPANY, Sandwich, Ill., has recently put upon the market the Sandwich Telegraphone, consisting of a combination of a telephone talking circuit and a special signalling apparatus so that the instrument may be used in connection with an ordinary telegraph wire without interfering with telegraph messages simultaneously transmitted.

The company claims that this apparatus will operate upon a quad or duplex circuit without interference. In designing the apparatus, the exceptional conditions under which it will be used were borne in mind, and exceedingly durable equipment is said to have been produced.

The company will be pleased to send full information to all persons connected with railways or other interests which may have occasion to equip a telegraph line for telephone service.

THE FARR TELEPHONE & CONSTRUCTION SUPPLY COMPANY, Chicago, Ill., is sending out several interesting folders describing its line of supplies and equipment for telephone companies. Among them are individual leaflets devoted to the 1900 dry battery, metal furniture for operating rooms and construction supplies. A feature is made of Rowland's long grip clamp for pulling up wires, which is a practical come-along in a compact form, giving a long contact surface on the wire. Its design prevents injury to the wire, and at the same time gives a grip which will stand an exceedingly heavy pull. Information regarding all the lines above mentioned, and other supplies of which the Farr company carries a complete line, will be cheerfully sent upon receipt of a request.

THE AMERICAN LAVA COMPANY, Chattanooga, Tenn., has issued a booklet describing the advantages of lava for various mechanical and electrical uses. It states that from the method of manufacture a considerable degree of accuracy of dimensions is possible in the construction of even very small bushings, etc. With respect to uniformity the material is said to offer some advantages over porcelain. Tests of the insulating resistance of the material show that very high figures are obtained. The company states that improvements in methods of working have made it possible to furnish this product at prices very much lower than former costs.

The booklet is well illustrated from photographs of many forms which are used commercially for insulating bushings, bobbins for resistance spools, etc. The booklet will be sent to all interested persons who address a request to the company.

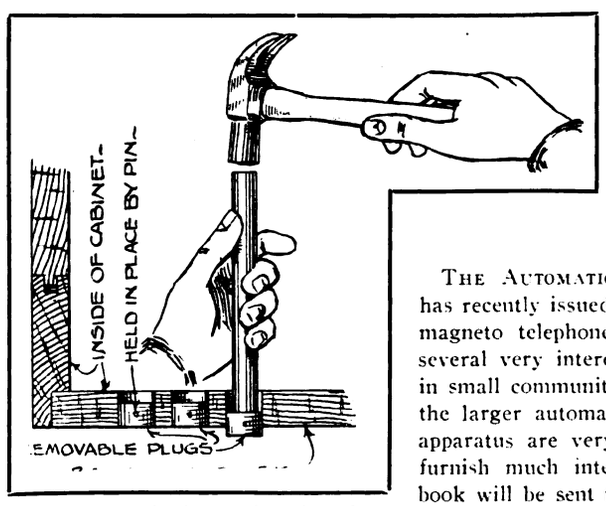

Fig. 2. Method of removing plugs from bottom of cabinet for entrance of line cables and wiring.

THE CENTURY TELEPHONE CONSTRUCTION COMPANY, Buffalo, N. Y., is to furnish the instruments and equipment for the new branch exchange at Cornell University, the contract for which, after careful consideration, has been recently awarded to the Ithaca Telephone Company, Ithaca, N. Y.

THE STACKPOLE BATTERY COMPANY, St. Marys, Pa., is sending out some interesting literature describing the Elk Brand Dry Cell, which is especially adapted for gas engine sparking and all ignition work. In its No. 6 cell the company also has a battery built especially for telephone work, which, in addition to the large amount of energy, which characterizes the output of all its types, is built for an extremely long life and to have good staying powers. The company states that very good results have been obtained in practice with these batteries, and will be pleased to send further information to all interested persons.

THE F. BISSELL COMPANY, Toledo, O., has in its latest catalogue described a number of interesting novelties which have been added to the well-known Security line of construction specialties. The field covered in this book embraces terminals for various classes of distribution, pole seats and platforms, braces, messenger cable cars, manhole guards, conduit rods, etc. The company will send this booklet to all interested persons.

THE CALCULAGRAPH COMPANY, 1437 Jewelers' Building, New York, is receiving many statements from telephone companies who have been able to effect economies by the use of the calculagraph. With the system of correct timing of toll tickets which is made possible by the use of this machine, there is little danger of loss of excess time on calls, and an indisputable record is furnished, which can be shown to the subscriber if there is any question as to the amount which should be paid on a ticket. The company will send full information upon receipt of a request.

THE AUTOMATIC ELECTRIC COMPANY, Chicago, Ill., has recently issued a very attractive bulletin devoted to magneto telephone switchboards. In it are described several very interesting types of switchboards for use in small communities which have lines connecting with the larger automatic exchanges. The descriptions of apparatus are very complete and well illustrated, and furnish much interesting information. Copies of the book will be sent to all persons who make their names known to the company.

THE PEIRCE SPECIALTY COMPANY, Elkhart, Ind., has just sent out an attractive catalogue of its steel construction specialties. Full descriptions of brackets for regular and special uses on poles, houses, etc., are included in this catalogue. An interesting development is a corner bracket for houses, and various types of wall brackets, rings, etc., which especially lend themselves to covered wire distribution along the sides of buildings. The bok contains so many interesting suggestions for managers interested in convenient and economical methods of distribution that it should have a wide circulation among telephone managers and superintendents of construction.

THE WIRE & TELEPHONE COMPANY OF AMERICA
ROME, N. Y.

THE NEW WESCO FACTORY

THE opening of its new factory, shown in the illustration, indicates the rapid advance made by the Wesco Supply Company, St. Louis, Mo., and Fort Worth, Texas, to a leading position in the electrical and telephone field.

For a long time past this house has been prominent among dealers in electrical goods and in recent years has been constantly adding to its output various lines of its own manufacture. Among the articles manufactured by this company which have found an extensive sale may be mentioned the well-known Wesco soldering specialties, the Red Shield and Wesco dry batteries, the Hercules pliers, knife switches, panel boards and switchboards and the well-known line of telephones bearing the company's name.

THE NEW FACTORY OF THE WESCO SUPPLY CO. AT ST. LOUIS, MO.

A few years ago this company began to assemble its own telephones and since that time has gradually taken up the manufacture of parts until, within the last year, the instruments have been manufactured in practically complete form in its own factory.

The development of this manufacturing business brought the necessity for larger quarters and a large five-story brick building at the corner of Eighth street and Clark avenue, St. Louis, Mo., has recently been secured and equipped throughout with first-class machinery for the manufacture of a complete line of telephone instruments and telephone accessories. The company is now ready to turn out an entire product made entirely under its own supervision.

This plant is now in full operation, and the company announces that all its manufacturing products will have a quality and efficiency fully up to the standard which its customers have learned to expect from their transactions with the company in the past.

The company will continue to carry in stock large quantities of batteries, wire, construction material and all other supplies necessary for telephone work. Prompt shipments of these goods can be made from either the main office at St. Louis or the branch house at Fort Worth, Tex.

NEW COMPANIES.

BLOUNTSVILLE, ALA.—The Blount County Telephone and Telegraph Company has been incorporated with a capital stock of $6,000.

PARIS, ARK.—An Independent telephone company, to be known as the Greasy Valley People's Telephone Company, has been organized at Paris. It will construct and operate lines from Greasy Valley to Paris, and the following officers have been elected: H. H. Brown, president; J. C. Freeman, vice president; E. N. Lee, secretary; A. A. Freeman, R. E. Rogers and W. L. Varn, directors.

PLAINVILLE, CONN.—The Empire Electric Mfg. Company has recently been incorporated for the purpose of manufacturing high grade electrical goods. A specialty will be made of switches for electrical circuits.

PLYMOUTH, IND.—A Mutual Telephone Company is being organized by the farmers of Plymouth. A similar movement has been started in Bourbon and Walnut townships, and indications point to a full county organization.

SERGENT, KY.—An Independent telephone company is being organized at Sergent to construct lines to Craftsville, Millston, Horn and Baker.

SOUTHWEST HARBOR, ME.—Articles of incorporation have been filed by the Island Telephone Company, which plans to build lines in Southwest Harbor, Tremont and Cranberry Isle. It has an authorized capital stock of $10,000, and the incorporators are Thomas S. Tapley, Guy H. Parker, L. S. Springer and F. M. Mullan, of Tremont, and Geo. A. Neal and W. A. Tower, of Southwest Harbor.

PONTIAC, MICH.—The Oakland County Telephone Company has been reorganized and is to be incorporated with a capital stock of $500,000. The following officers have been elected: A. C. Himebaugh, of Burr Oak, president; J. A. Graley, Pontiac, vice president; A. G. Griggs, Avon, secretary and treasurer. It is the company's intention to construct an entire new plant, it's plans for improvement including, besides the installation of a new switchboard having a capacity for 2,300 telephones, the building of many new lines.

MADISON, MINN.—The Madison Telephone Exchange has become the property of J. R. Swann, J. J. Little, Wm. Kitzinger, P. G. Jacobson and R. H. Greer, and is to be incorporated with a capital stock of $15,000. A strictly up to-date system is to be installed by the new company.

BETHEL, MO.—An Independent telephone company, to be known as the Bethel Telephone Company, has been organized, and will construct a line to Metz, at which place it will connect with the Metz Telephone Company. The officers of the new company are R. L. Graham, president; N. S. Brown, vice president; R. L. Yeates, secretary and treasurer; J. Thomas, D. F. Carey and S. T. Shellenberger, directors.

HAMILTON, MO.—Articles of incorporation have been filed by the Hamilton Telephone Company. The capital is placed at $30,000, and the incorporators are H. B. Cooper, J. N. Munsell, W. E. Munsell and others.

PATTONSBURG, MO.—The Pattonsburg Home Telephone Company has been incorporated with a capital stock of $25,000. Among the incorporators are Elwood Morrison, S. N. Grover, James M. Eyeler and others.

SMARTVILLE, NEB.—The Mutual Telephone Company has been reorganized and incorporated with a capital stock of $25,000, and the following officers have been elected: C. Swiklinski, president; David Bowen, vice president; James Murphy, secretary; Henry Hintz, treasurer.

JEWETT, N. Y.—The Schoharie Valley Telephone Company, with a capital stock of $2,000, has filed articles of incorporation and has elected the following directors: John Stickels, of Hunter; N. W. Ploss, J. H. Gripman, G. W. Dunham, F. A. Ford, F. C. Carr, E. Ploss, S. R. Lewis and A. Chatfield, of Jewett. It is the company's intention to build lines connecting Lexington, Jewett, Hunter, Haines Hall and Tannersville.

VESTAL CENTER, N. Y.—Articles of incorporation have been filed by the Vestal Center Telephone Company. The company is capitalized at $2,000, and its intention is to construct lines from Vestal Center to Binghamton, St. Joseph, Willow Point and Tracy Creek. The directors are B. L. Harford, John Rounds, J. P. Gardner, A. A. Brimmer, M. J. Morton, C. D. Kellam and C. H. Woodruff.

CLAYTON, N. C.—Articles of incorporation have been filed by the Clayton Telephone Company. It has an authorized capital stock of $3,000 and the incorporators are Ashley Horne and others.

FULLERTON, N. D.—A Farmers' Telephone Company, whose intention is to construct rural lines at Fullerton, has been organized.

FREDERICK, OKLA.—The Tillman County Telephone Company, of Frederick, has been incorporated with the following incorporators: F. D. and M. B. Stalford, of Frederick, and John Massey, of Guthrie. The capital stock is placed at $20,000.

NEW GALILEE, PA.—The Big Beaver Telephone Company is being organized by the farmers in the vicinity of New Galilee. Among those largely interested in the new company is A. H. Hoopengartner.

NEW WILMINGTON, PA.—A new Independent Telephone Company is being organized at New Wilmington by J. W. Cox, J. B. Elder and others.

ARMOUR, S. D.—An Independent Telephone Company has been organized at Beulah (P. O. address Armour, S. D.) to construct lines between Beulah, Sand Creek, Spearfish and other places. Among the organizers are Frank Avery and Fred Robinson.

HAMLIN, TEX.—The Orient-Santa Fe Telephone Company, of Hamlin, has been incorporated with a capital stock of $25,000. The incorporators are H. B. Foreman, W. L. Walton and E. A. Lee.

SEGUIN, TEX.—The Mill Creek Telephone Company is the name of the new farmers' telephone company organized at Seguin, and the following officers have been elected: H. C. Buhler, president; Marvin Lillard, secretary and treasurer.

WEHDEM, TEXAS.—The Wehdem-Brenham Telephone Company has been incorporated with the following incorporators: W. J. Reinicke, H. Roppelmeyer, A. P. Chernosky, W. Rhode and Henry Remmert.

RUTLAND, VT.—The incorporators of the Vermont Home Telephone Company, which was recently granted a charter to operate an Independent service by the Vermont Legislature, recently met in Rutland and organized by electing the following board of directors: C. O. Perkins, C. S. Caverly, F. A. Field, W. H. Baldwin, of Rutland; I. H. Griswold, Howard Hendrickson, I. R. Coughtry, of Albany; F. H. Sudro, T. M. Brush, of Elyria, O.

GRANTSBURG, WIS.—An Independent Telephone Company is being organized at Grantsburg. Among those interested in the proposition are R. J. Meland, A. Paulson, S. N. Hanson, E. Johnson, F. R. Huth and others.

HILLSDALE, WIS.—Articles of incorporation have been filed by the Hillsdale Western Telephone Company. It has a capital stock of $2,500, and the incorporators are M. W. Stephenson and others.

NORWALK, WIS.—Plans for the formation of a new Mutual Telephone Company at Norwalk are being considered by the citizens of this city. An exchange will be installed at Norwalk and connections established with Sparta.

SACKVILLE, N. B., CAN.—A new telephone company is to apply for a charter to the local legislature to build toll lines throughout the province. The company expects to have a capital of one-half a million dollars, of which over $150,000 has already been subscribed.

FRANCHISES.

DOWNEY, CAL.—The Downey Home Telephone & Telegraph Company has applied for franchises at Norwalk, Downey and Los Nietos, and the Board of County Supervisors expects to advertise for sale a telephone and telegraph franchise to cover these towns.

LOMPOC, CAL.—A franchise has been granted to the Home Telephone Company at Lompoc, and work on the system will be commenced at once.

HUDSON, MICH.—The Southern Michigan Telephone Company, an Independent company, has been granted a thirty year franchise at Hudson, and will build a system at this place.

UNION CITY, MICH.—Application has been made by the Himebaugh Telephone Company for a franchise at Union City.

COMBINATIONS.

SUFFOLK, VA.—W. N. McAnge, who is one of the largest individual telephone owners in the South, has recently sold the Virginia and Carolina Telephone Company to the Atlantic Coast Telephone Company, of Suffolk, Va. He has been appointed president and general manager of the latter company, and will make extensive improvements in the system. It is hoped that terminal facilities in Richmond will soon be obtained, after which he will complete the line to that city.

ELECTIONS.

WHITTIER, CAL.—The following officers have been elected by the Whittier Home Telephone Company: Albert Hadley, president; E. W. Bacon, vice president; Olive L. Spencer, secretary; A. Wardman, general manager; First National Bank, treasurer.

GERLAW, ILL.—The Indian Grove Telephone Company has named the following officers: President, A. McQuerry; vice president, R. J. Rohr; secretary and treasurer, J. R. Armstrong.

COIN, IOWA.—The following officers have been elected by the Coin and Yorktown Telephone Company: President, A. L. Johnston; vice president, D. Cutler; secretary, F. E. Handorf; treasurer, W. Cutler; directors, E. Corder, R. Draper and A. King.

ELDRIDGE, IA.—The Eldridge Mutual Telephone Company has elected the following officers: President, F. C. Gagahan; vice-president, J. B. Crouch; secretary, M. H. Calderwood; treasurer, H. W. Bruhn.

LIBERTYVILLE, IA.—The following officers have been elected by the Libertyville Telephone Company: S. K. Davis, president; E. A. Wilson,

PERSONAL.

H. E. TERRY has been appointed manager of the Central Union Telephone Company's exchange at Moline, Ill.

J. M. TUTTLE, of Hortonville, Wis., has been appointed manager of the Wisconsin Telephone Company's exchange at Beloit, Wis.

New Construction in the Field

RUSSELLVILLE, ARK.—The lines of the Russellville Telephone Company are to be extended.

ANAHEIM, CAL.—New switchboards are being installed by the Home Telephone Company in its exchanges at Anaheim and Fullerton.

DALTON, GA.—The Dalton Telephone Company contemplates the erection of new lines from Chatsworth to Spring Place.

INDUSTRY, ILL.—It is the intention of the Industry Rural Telephone Company to make many improvements in its system.

PEORIA, ILL.—It is the intention of the Citizens' Telephone Company to construct a metallic toll line between East Peoria and Washington.

QUINCY, ILL.—Many new lines are to be built by the Adams County Telephone Company.

QUINCY, ILL.—The Mississippi Valley Telephone Company contemplates the establishment of a long distance service into Quincy.

BORDEN, IND.—The Farmers' Union Telephone Company expects to build two new lines, one from near Greenville, and one from the head of the Indiana Creek.

SOLDIER, IDAHO.—The lines of the Local Telephone Company are being extended throughout Blaine county.

SIOUX CITY, IOWA.—New lines are being constructed by the New State Telephone Company from Sioux City to Council Bluffs via Onawa and Missouri Valley.

OWENTON, KY.—A telephone line from Owenton to Monterey, by way of Cedar Hill, is to be erected by J. A. Johnson.

PALERMO, ME.—Lines to Western Ridge are being constructed by the Palermo Telephone Company.

LESLIE, MICH.—The Onondaga, Porterville & Leslie Telephone Company is extending its system north and west of the village.

ODIN, MINN.—The Odin Telephone Company is building a line from Odin to Echols.

ROCHESTER, MINN.—The Rochester Telephone Company expects to erect a new exchange at a cost of $25,000.

HASTINGS, NEB.—New lines are being built by the Hastings Independent Telephone Company.

HULL, NEB.—The Hull Telephone Company, which has erected a line to Harrisburg, also contemplates the erection of a line to Epworth.

SEARCHLIGHT, NEV.—The system of the Searchlight Western Telephone Company is being extended from Searchlight to Nelson.

WARREN, N. H.—It is the intention of the Baker's River Telephone Company to erect new lines from Warren to Haverhill.

BELFAST, N. Y.—A new switchboard is being installed by the Belfast Telephone Company.

CLIFTON SPRINGS, N. Y.—Among the improvements under way by the Clifton Springs Telephone Company is the erection of a new line to Hopewell.

NEWBURGH, N. Y.—Among the many improvements planned by the Newburgh Home Telephone Company is the installation of a new plant at this city, the building of lines to Fishkill and other places, and connection with all the Independent lines up the State.

VESTAL CENTER, N. Y.—New lines are to be built by the Vestal Center & Bunn Hill Telephone Company.

WILLOW POINT, N. Y.—Considerable construction work is being done by the Willow Point Telephone Company.

BISMARCK, N. D.—The North Dakota Independent Telephone Company contemplates the expenditure of several hundred thousand dollars in improving its system. New toll lines are to be built and an exchange installed at Bismarck.

EDINBURG, N. D.—Two new lines are to be constructed by the Edinburg Telephone Company.

FARGO, N. D.—Residents of North Dakota will probably soon be able to secure direct telephone connections with Winnipeg and all other cities and towns of Manitoba, Canada, through the North Dakota Independent Telephone Company, of Fargo, N. D.

COLUMBUS, O.—The Columbus Citizens' Telephone Company contemplates the expenditure of about $6,000 in improvements.

COLUMBUS GROVE, O.—The proposed new construction work of the Columbus Grove Farmers' Mutual Telephone Company includes the erection of a line from Columbus Grove to the German settlement.

COSHOCTON, O.—It is estimated that about $20,000 will be spent by the Citizens' Telephone Company in its proposed extensions and improvements.

FINDLAY, O.—The Western Ohio Railroad, an electric line operating between Findlay and Wapakonetta, is putting in an independent telephone system for the exclusive use of the road.

MANSFIELD, O.—Many improvements and extensions in its system are to be made by the Mansfield Telephone Company.

SANDUSKY, O.—Fifteen thousand dollars is to be expended by the Sandusky Telephone Company in the improvement of its system.

KUTZTOWN, PA.—Additional lines are being built by the Kutztown Telephone Company from Kempton to Steinsville, Lynnport, Tripoli, Mosersville and other places.

PITTSBURG, PA.—The American Union Telephone Company, which was formed about three months ago by the consolidation of the majority of the Independent lines of Pennsylvania and adjoining States, is about to commence the actual work of the construction of the new Pittsburg-Philadelphia line.

WENTWORTH, S. D.—The lines of the Farmers' Telephone Company are to be extended.

BELMONT, W. VA.—It is the intention of the Belmont Telephone Company to construct additional lines to Bellaire, St. Clairsville, Barnesville, Martins Ferry and other places. In addition to the above extensions, it contemplates the installation of a new submarine cable from Martin's Ferry to Wheeling.

EDMONTON, ALBERTA, CAN.—The Alberta government has decided to construct a third long distance telephone line, and will soon commence operations on a line to connect Lacombe and Stettler, a distance of fifty-one miles. Address Hon. W. H. Cushing, Calgary, Alberta.

Quality Higher Than Price

¶ It's an easy matter to talk quality and price, but quite another to produce the goods to back it up.

¶ We have always put more faith and dollars into securing good materials and employing skillful and intelligent labor in the manufacture of our telephones than in advertising the fact, and the careful buyers are beginning to find it out.

¶ Prejudice and ignorance may hold the fort for a day, but merit and fair dealing in the end are invincible.

¶ We solicit your inquiries and an opportunity to quote prices and submit samples of our product.

JUST A SUGGESTION

Take one of your busy 4-party lines and equip it with "POOLE" Lock-Outs. Leave it in service a month and then see how many of the four will stand a raise of $3.00 a year rather than go back to the old way. We know the answer, but we want your subscribers to impress on you the fact that the "POOLE" Lock-Out is a rate-raiser.

It won't cost you anything to try it, because we will loan you the Lock-Outs free and there is no other equipment required. Write today for our Booklet AL-2.

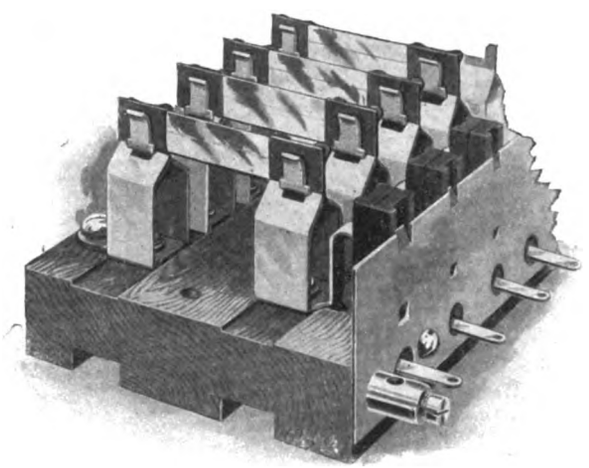
DEAN TELEPHONE APPARATUS

EXPRESS SWITCHBOARD ARRESTERS



The above illustration shows our new arrester to be used in connection with our express switchboards.

Like all other Dean apparatus it is built to eliminate trouble—a most common occurrence in small switchboard arresters.

The fuses are tightly gripped in special clamps which always hold their pressure. This is made possible by a peculiar construction of the springs which will not allow the clamps to be spread enough to spoil the tension.

The metal parts of this arrester are securely fastened together by means of hollow rivets, thus assuring a positive electrical connection from the line cable to the switchboard cable. No dependence is placed on the woodwork or the binding through insulation material, as in other arresters of this kind, for this circuit.

See our folder No. 6 for further details. It will pay you to investigate our express type equipment before placing your next order.

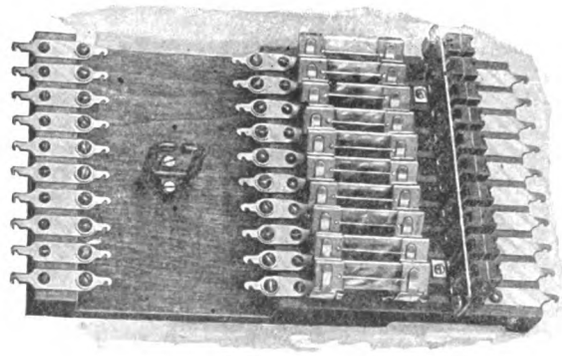
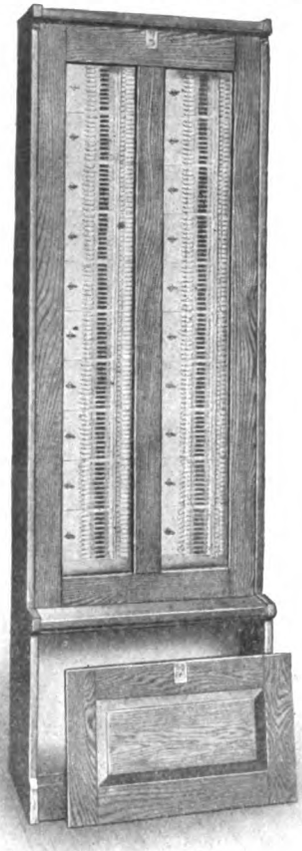
MONARCH

ARRESTERS AND ARRESTER CABINETS

The arresters are mounted five per strip so that it is not necessary to buy more lines of protector than there are lines in the switchboard. The construction shows the usual Monarch Characteristics of strength and durability. The connectors are heavy brass and the spring clips bring sufficient pressure to bear against the fuses and carbons to positively insure good contacts. The ground plate is a wide strip of brass slotted at one end and fitted with a screw at the other end, so any number of sections can be mounted one above another.





The arrester cabinet is designed to fill a demand for a neat and yet inexpensive cabinet for magneto exchanges using fuse and carbon arrester sections. It is made in two sizes: One for 100 metallic lines and the other for 150 metallic lines. The removable glass front and bottom panel afford easy access to the arresters and the cables coming to them.

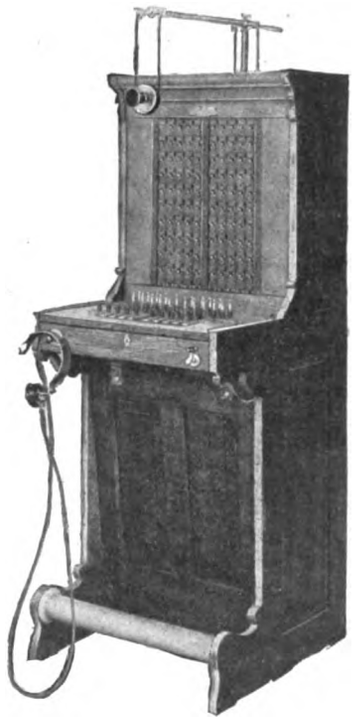
KELLOGG

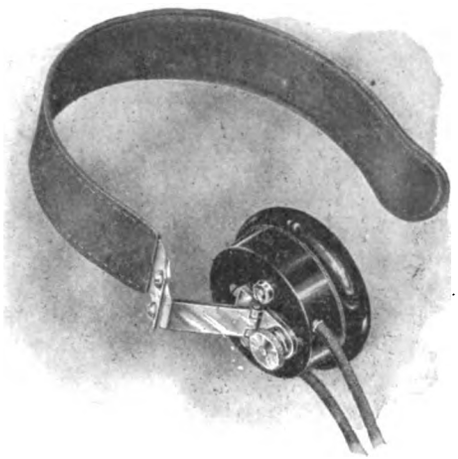
TELEPHONE APPARATUS

MAGNETO SWITCHBOARDS

ARE EQUIPPED WITH KELLOGG

WATCHCASE HEAD RECEIVER





This type of a receiver is very compact.

The shell is entirely made of hard rubber and has a removable ear-piece.

The spring steel headband is covered with leather and is provided with a hinge, so that it may be swung backward. It is so constructed that it will not catch in the hair of the operator.

It is impossible for the operator to get a shock from this receiver, as there are no exposed metal parts, which will make contact with the head.

THE CORD TERMINALS are so constructed that standard cord tips can be used on receiver cord, and be practically concealed. This construction absolutely prevents a short circuit in the receiver. Cords can be securely attached or removed without opening the case.

The six semi-circular MAGNETS are supported by the case from the back and sides. They are made of special magnet steel, and retain their magnetism indefinitely.

The two Norway iron POLE PIECES are also supported by the case

THE MAGNET COILS are wound to 60 ohms resistance.

THE DIAPHRAGM is made of ferro-type metal.

THE ADJUSTMENT is made permanent by the general construction of the receiver.

THE OPERATOR'S CUT-IN JACK is very compact in design and does not interfere with apparatus mounted on the keyshelf. The springs of German silver are platinum pointed, U-shaped and are of good length without making the jack long.

THE CUT-IN PLUG is very short, and does not protude from the face of the keyshelf to interfere with the operator. The handle is of hard rubber; the tip and sleeve contact of brass.

This receiver is furnished with a 72-inch two-conductor green silk cord.

For switchboard work it is the most successful compact receiver on the market to-day.

Write for "Bulletin No. 9A," which completely describes our Magneto Switchboards.

You Wouldn't Start a Horse Car Line

in this age of electric cars? Not if you wanted to make money out of the business of transportation.

Then why should you start a manual telephone exchange in this age of automatics, if you want to make money out of the telephone business?

The automatic system of telephony bears the same relation to the manual system that the electric car does to the horse car. It is the apotheosis of telephone development, as the electric car is of transportation development.

The automatic telephone system produces the best service more economically than indifferent service can be produced with manual equipment.

There is no more question as to the relative popularity of the automatic and manual telephone service where the two kinds are in competition than there is as to the relative popularity of the trolley car and the horse car.

And, as for the securities—the same comparison may be applied with the same results.

Our Automatic system has been adopted in the following cities:

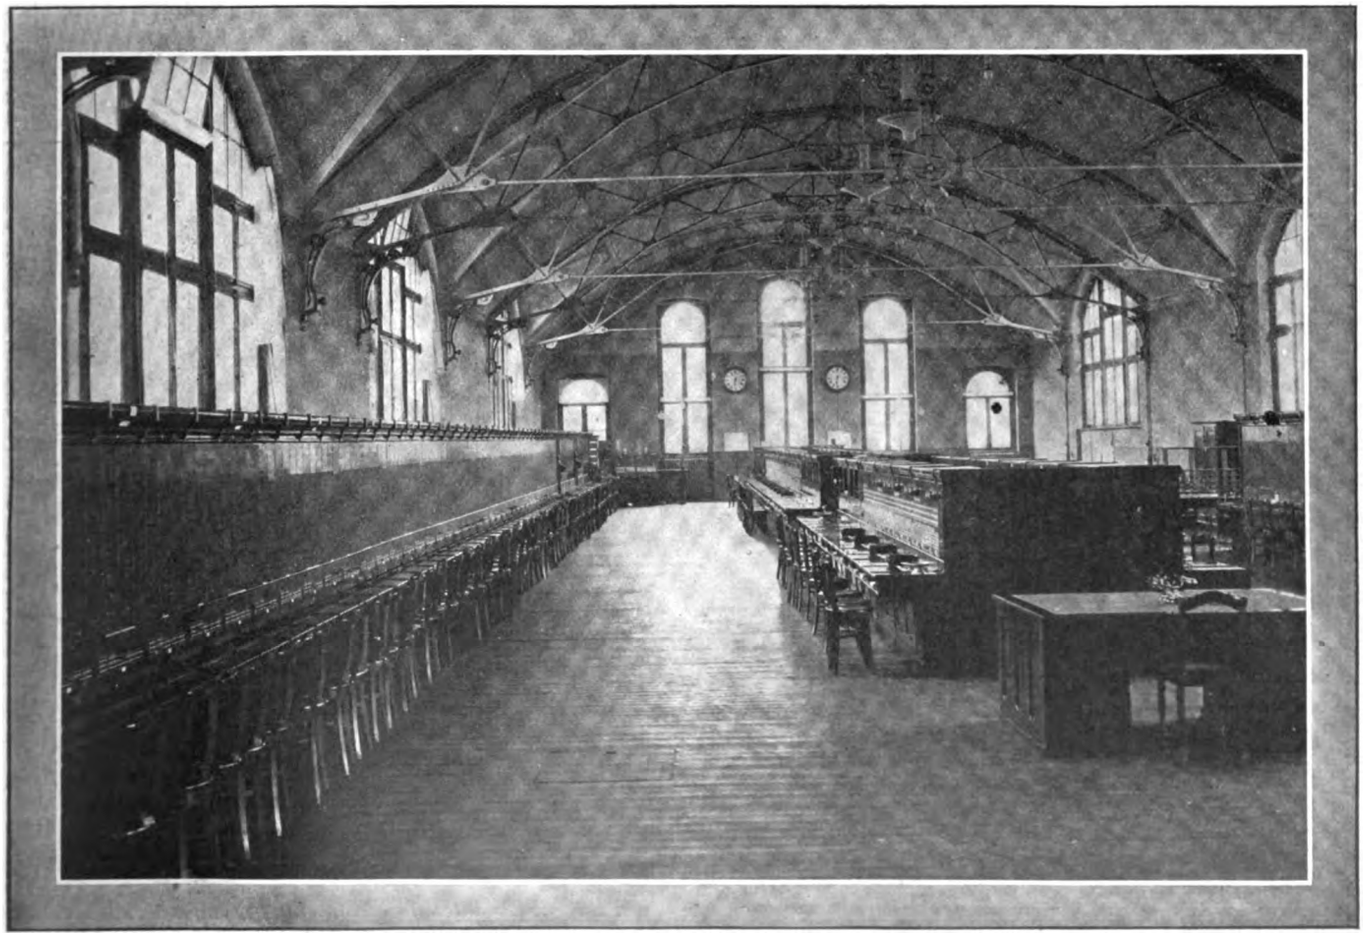
Mammoth New Telephone Switchboards at Leipzig, Germany

By Dr. Alfred Gradenwitz.

With a capacity for 20,000 subscribers' lines and 500 toll lines, and equipment already installed which allows for the use of 14,940 local and 224 toll lines, the new telephone exchange at Leipzig is one of the largest of the modern offices in the German Empire. The switchboard is widely different from the horizontal and other types which for a long time were so extensively used in Germany, the influence of American practice being plainly evident. The board is of the familiar multiple type. There are twenty-eight three-position local sections. Nineteen of these are set apart for flat rate service and the remainder are used for measured service business. Each flat rate operator's position is equipped for 120 lines. As the rate of calling on the measured service positions is much lower, an operator can handle many more lines, and equipment for 300 lines is provided at each position. Lamp signals are used in connection with the lines, being associated with the answering jacks in the customary manner for common battery switchboards. Cord circuits are each provided with two supervisory lamps, mounted in the keyboard. The relays for controlling these supervisory lamps are mounted in the regular way at the rear of the switchboard sections.

The long distance boards are in the same room with the subscribers' board. They are set up in the middle of the hall, and are well lighted from the high windows. The sections are set in two rows with their backs turned toward the centre of the room. A passage between them allows the employees to obtain access to the sections for the making of repairs. Each toll position is equipped for handling four lines.

The toll plant includes not only the 28 two position line sections, but also nine "ordering" sections and one distributing board. The distributing board is used for the preliminary handling of requests for long distance lines. When a subscriber calls for a long distance connection he is immediately switched to this board by his local operator. At the distributing board his line is immediately connected through to an idle operator at an "ordering" position. Here the operator takes the details of his call, and sees that they are transmitted to the proper line operator at the toll board. This operator obtains the desired person at the



Switchboards for Handling Toll and Local Business in the New Leipzig [illegible]change.

Digitized by Google

distant exchange, and has the connection completed back through the local board. The use of the distributing board effects a considerable saving in time, as the subscriber does not have to wait for an operator to finish handling another call before answering him. It also insures a regular distribution of calls among the operators at the "ordering" or recording positions.

The entire operating room was designed to give a maximum of daylight upon the switchboard. Such space as is not actually taken up by the sections is clear of obstructions, and the grouping is such as to make the open spaces between the different classes of boards as large and uniform in size as possible. The desks of the supervising operators are so placed as to give a clear view of such portions of the room as they should see for the proper performance of their work, without interfering with extensions of the lines of sections which will become necessary in the future. The operating room has a high vaulted ceiling, giving plenty of air space, thus insuring good ventilation.

HOW THE SOUTH DAKOTA TELEPHONE ASSOCIATION WAS MADE INDEPENDENT.

GEORGE T. HEWES, of Des Moines, Ia., who went to the recent South Dakota Telephone Convention to tell about his work in building up the clearing house in his State, relates in a very interesting manner some of the events which particularly attracted his attention as a sound Independent telephone man.

When he first entered the Cataract Hotel at Sioux Falls he was somewhat surprised to see "Blue Bells" suspended in all sorts of prominent locations. This was not so remarkable as it would be in many States, however, as in South Dakota the preceding three conventions had been largely attended and dominated by Bell interests. On January 8 the first indication that this fourth meeting was to be different from the others presented itself in the appearance of the Shield conspicuously placed on the side of his dress suit case. The emblem received such a good reception that other people began to bring it into evidence, and stickers soon appeared on the hotel register and in other prominent places. The resemblance of the Shield to the American flag suggested that the proper sentiment towards all those who were disposed to antagonize it would be the old adage, "If any one attempts to pull down the American flag, shoot him on the spot." On the second day of the convention the Shield appeared conspicuously above the "Blue Bell" in several prominent places, and there it stayed during the remainder of the convention.

When the delegates entered the dining room for breakfast they found the waitresses liberally supplied with Bell decorations. It did not take the Independent men long to obliterate these unfriendly signs with their stickers in a way which caused considerable amusement. When the convention was called to order every Independent delegate and every representative of a manufacturer or supply house wore a Shield.

During the progress of the convention Mr. J. L. W. Zeitlow, of Aberdeen, brought up the question whether all telephone men were entitled to seats in the convention, with a voice in its doings. He was answered by Mr. Geo. W. Burnside, of the Citizens' Telephone Company, Sioux Falls, who said that while there might be nothing on the books of the association to prevent representatives of other than Independent telephone companies from becoming members, it was his understanding that the organization was for Independent telephone men only. Mr. Burnside then moved that the convention should recognize no representative of the Bell telephone company, or any company allied with it. This motion was carried without a dissenting vote. The final step in the overthrow of the predominant influence of the Bell companies in this association was the changing of the name from the South Dakota Telephone Association to the South Dakota Independent Telephone Association. The Bell people who were present were so thoroughly cowed by this time that there was not a dissenting vote.

At the close of the meeting there was a little excitement when the final question was raised as to whether or not representatives of Bell telephone companies should be allowed to join at the banquet, and in fact when somebody proposed that the employees of the local Bell exchange should be invited the commotion became intense. It was finally decided that although the Bell people would not be allowed to take any part in the proceedings, there would be no harm in allowing them to come and take a little nourishment as the guests of the Independents. The real Independents are growing so rapidly that they can afford to be generous.

Toll Line Construction*

By S. A. Hensley,

Superintendent Western Telephone Co., Lincoln, Neb.

TOLL lines must not be only so constructed, mechanically and electrically, as to carry properly the talking current, but also be so distributed as to afford at a minimum expense of material, labor and maintenance, access to all points to which access is desired. In the most advanced practice the location of the business and its probable growth are determined beforehand as accurately as possible, and the distribution of toll lines is made from this data. In this way the work of toll line construction can be pushed in advance of daily needs. The largest companies should plan toll line requirements for two, three or five years in advance of actual traffic requirements. Under these conditions the toll lines are built to pre-determined points.

Before constructing a toll line, the first work is to determine the most feasible route to be followed; in doing this a great many factors have to be taken into consideration. In general the shortest route should be selected. However, the nature of the ground, soil, hills and hollows, creeks, etc., and also the number of trees and other obstacles which would interfere with the line should not be overlooked.

There is another factor which is far more important than deciding the course of a pole line, and it is one which does not lend itself to any mathematical solution; that is the right of way. Before the pole line can be built on a road or public thoroughfare, the consent of the property owners along the road must be obtained, or a franchise from the town or city must be secured. In the majority of cases, particularly in the small towns and in the country, both must be obtained. The right-of-way permits should also include the right to trim any and all trees that may protrude through the line. The route to be selected is the best one, according to the above considerations, along which a right-of-way can be obtained.

Prior to commencing any construction each foreman should be supplied with blue prints and maps showing the locations of all rights-of-way. The maps and contracts should be sufficiently explicit in the descriptions of the locations of all poles, guys or other attachments to enable the foreman to proceed with the construction without hesitation or difficulty. Of course it is understood that the foremen are to be thoroughly experienced and competent men.

Looked at from a standpoint of construction, toll lines are all included in a single class, *i. e.;* open or aerial wire lines. The pole is the most important feature of the open wire construction, and since it has to bear the load of the wire under all conditions it is essential that the wood used be selected with the utmost care. Whatever kind of wood is selected, it should be the very best material and inspected by a thorough and competent inspector. The size of the pole required will depend on the number of wires to be carried and on the height of obstacles, if any, to be overcome.

Many attempts have been made, with more or less success, to treat poles artificially, so as to protect them against the action of the weather. The general practice is to paint the pole thoroughly after it has been placed. This does very well for appearance in towns and cities, but it has been found wanting as a means of preserving the pole, as the water will enter the cracks in the pole and cause what is known as "dry rot." It has been found by experience that unpainted poles are the longer lived. The point at which the pole is most liable to decay is at the surface of the ground. This is because at this point the action of the dampness in the ground and in the air is greatest. Various methods have been devised for protecting poles at this point, such as a coat of tar; but the general practice to-day is to depend altogether upon paint, and the treating with Carbolineum Avenarius. This method is in general use by the government and all Eastern toll line companies, and has been found to prolong the life of poles from six to ten years.

The cross arm is next in importance to the pole, and the utmost care should be taken in the selection of material and the design for its construction. The pins used in telephone work are made of several different kinds of wood, and are divided into two classes, standard pins and transposition pins. Standard pins are those used in the general construction of a pole line, and transposition pins are used for transpositions only.

For insulators, with the exception of that portion of the line known as the "drop line," the material commonly used is glass. Porcelain has some advantages over glass as a material for making insulators, and on the other hand, glass possesses some advantages over porcelain. Porcelain is more expensive than glass and its glazed surface soon becomes cracked under the influence of the cold, thus allowing rain to soak into the interior portion and greatly reduce the insulating power. Glass, however, possesses one peculiar advantage over porcelain: cocoons and spider webs are much less likely to form on glass, because glass is transparent and does not offer the shade that seems to be desired by worms and spiders. If spider webs and cocoons form on a line, in any great number, they cause the line to become heavy and partially grounded, as the case may be, as it has been found by experience that the spider's web is a conductor.

The greatest care should be exercised in stringing wire of any kind. Care should be taken not to put any nicks or kinks in it or injure it in any way, so as to weaken the wire. Copper wire, especially when being tied to the insulator or in making the connection, should be handled with extreme care; no pliers or tie wrenches should be used. Half copper sleeves should be used in dead ending all copper wire, and whole copper sleeves for making all joint connections.

The heavier wires should always be strung on the middle pins of the cross arms and the lighter wires on the end pins. All wires should keep the same position on the cross arms from the starting to the terminating points.

The condition of the weather should be watched very closely when stringing wire and the proper sag between the same should be given. By doing this a great deal of trouble is avoided, as to breakage and slack wires.

It is a well-known fact following the laws of self and mutual induction, that if two wires are placed parallel to each other an alternating current flowing on one wire will induce similar and opposite currents on the other. If the telephone circuit is metallic and the disturbing wire is placed so as to be at equal distances from the two conductors of the telephone circuit, no induced current will be produced in the latter, since if the disturbing wire has a positive charge at any time, the surfaces of the two telephone conductors nearest to it will have a negative charge, while those remote will have a positive. As the charge of the disturbing wire changes to negative, that on the adjacent surfaces will change to positive, and that on the remote surfaces will become negative. Since the telephone circuit is not grounded, it is obvious that the only way for this charge to take place is by the current flowing across the wire, which produces no noise. When the two conductors on the telephone circuit are at equal distances from the disturbing wire, a different condition prevails. At the instant a disturbing wire receives a negative charge, the positive charge is induced on the adjacent surfaces of the nearest telephone conductor. The negative charge being repelled to the remote conductor causes a flow of current from one end toward the other, with a resultant noise in the receivers. It will now be apparent that if two metallic telephone lines are placed side by side and the conductors of the circuits are not disposed symmetrically with respect to each other, cross-talk

*Abstract from an address delivered at the convention of the Nebraska Independent Telephone Association.

Digitized by Google

will be the result. This condition is overcome by transposing the conductors of the telephone circuits at certain intervals. This process is called transposition, and is resorted to on all open wire lines to prevent cross-talk and other disturbances. Quite an elaborate scheme has been worked out for the transposing of conductors on lines carrying several cross arms. On toll line leads, where subscribers' lines parallel the toll lines, it is most essential that all the lines should be transposed according to the specification code. The writer's experience has shown that as much attention must be paid to the transposing of lines as to the proper stringing of the wire and building of the lead. No two wires of equal length will have the same resistance, and if a line is not transposed this will cause what is known as an unbalanced line, which in fact is a noisy line. By cutting in transpositions the circuits are balanced to give the same resistance on each of the wires, giving a perfect toll line circuit.

There has been worked out, very successfully, what is known as a "phantom circuit." By transposing any two parallel toll circuits so as to balance the two lines which are to be used, the two lines may be made into three distinct and complete telephone circuits. The station ends of the line will be provided with an approved repeating coil, which is necessary to complete a phantom circuit.

One of the most important features in cutting transpositions is to know how to do the work. As an example in cutting in a transposition if one should throw the left hand wire over the right, and at the next transposition throw the left hand wire under the right hand wire, he would have no transposition at all.

In cutting transpositions, one should make it a rule to throw the left hand wire over the right no matter which way you are going, or at which end you begin to string the wire; your wires will all be transposed after completing the line. In reality it takes three transpositions to make one complete transposition turn. By this is meant that in three transpositions one wire makes a complete turn around the other. If the wire could be taken out over the pole and twisted up into a space of three inches, the wires would be twisted into a rope three inches long. It makes no difference at which end of the circuit one starts stringing the wire, he must transpose on the same letter all the way through the lead.

The Proper Equipment of the Local Exchange*

By J. L. W. Zietlow.

MUCH could be said about the various appliances used in an exchange room and the merits of different makes of apparatus brought out, but it is not my purpose to handle the matter in this manner. The size of the exchange, the natural growth or future requirements should be well considered in ordering a new switchboard. In most cases it would be economy to start with at least a hundred number cabinet, even though only twenty-five or thirty drops were to be installed therein. Such a board should be equipped with at least six cord circuits, including double position ringing and listening keys, thus enabling the operators to ring on either end of the line without changing plugs, as well as to listen and to cut in a repeating coil if necessary.

I say at least six cord circuits—ten is even better, because in a small exchange it is very difficult for an ordinary lineman to give the cord circuits as well as the ringing and listening key the proper attention. It is better to defer repairing them, provided there are enough extra ones to avoid tying up the exchange, until it is economical to send for an experienced switchboard man. Naturally a switchboard should be provided with all modern attachments necessary to render good service. This includes night bell circuits and adjustable transmitter and head receiver.

If the exchange is small and party lines and rural lines are used, combination drops and bells should be used for this purpose. But where an exchange is large enough to require the constant attention of an operator these should be eliminated, as they cause a great deal of confusion when receiving calls, etc. Eighty or hundred ohm drops should be used for all series work, but for heavy party or farm lines one thousand ohm drops are preferable. Selective ringing and even lock-out attachments are a good thing, provided there is competent help to care for them. One of the most difficult things is to impress on the operator or the average lineman the necessity of using a repeating coil where grounded and metallic lines are connected.

To obviate this trouble it might be well to use a different size jack and plugs for the metallic lines and grounded lines. By equipping certain cord circuits with repeating coils and terminating such cord circuits on the different kinds of plugs, no call could be answered by using the wrong cord or plug. If this were followed out a great deal of cross talk and poor service would be eliminated. Strange as it may seem, most of the operators as well as the ordinary linemen imagine that because they can hear nicely on a metallic and also on a grounded line without using a repeating coil, that one is simply asking them to do something which is not necessary. They do not realize that by disregarding the use of repeating coils they are causing an endless lot of trouble and poor service on the terminal end of the line.

The switchboard should be properly cabled to a distributing board, which for small exchanges can be set up in connection with the ordinary carbon block and fuse board. In fact, it is all that is necessary in any exchange where there is no danger from electric light or power currents, and would apply to most of the exchanges in this western country, as but very few towns have any electric light and power circuits. Where the latter exist heat coils should be used, thus guarding against sneak and other foreign currents.

Where toll lines are handled in connection with the ordinary exchange, timing devices as well as facilities for handling toll records should be provided. When the exchange room is used for a public toll station, proper railing or counters should be provided to prevent the public from encroaching upon the space needed by the operator in the performance of her duty, as well as to prevent meddlesome people from interfering with the apparatus. Magneto systems and trunking devices are sufficient until five hundred subscribers are served, and I believe as a rule will give better results than the common battery system. This statement will, no doubt, be questioned by our common battery friends, but it must be borne in mind that the average small exchange cannot afford to employ an expert who is acquainted with all the details of the common battery system, and unless such a system is well cared for it indeed renders very poor service.

In fact, it is a question in my mind whether or not a common battery system can give as good service as the ordinary magneto system, the same outside construction being used in both. The only advantage to be derived from a common battery service in a small exchange is possibly the supervisory or clearing out signals. If lamp supervisories and clearing out signals could be properly used on the magneto board it would be much simpler and cause less annoyance in the small exchange than the common battery system. However, as the number of subscribers increases the common battery and multiple system should be used.

*Abstract from a paper read at the convention of the South Dakota Independent Telephone Association.

OHIO INDEPENDENTS TO MEET AT COLUMBUS ON MARCH 28.

THE members of the Ohio Independent Telephone Association are to meet on Thursday, March 28, at Columbus, O. A large attendance is expected, and it is believed that many prominent telephone men will take an active part in the meeting. The enthusiasm which has been shown in the success of the movement throughout the State has been strong, and will no doubt be much in evidence at the convention.

Principles of the Telephone*

By Arthur Bessey Smith, Department Telephone Engineering, Purdue University.

EVERY telephone has within it two sets of apparatus, one for signalling and the other for talking. The former is for the purpose of calling attention to a telephone call, and is made in a variety of ways. The talking set has two pieces of apparatus that come to the attention of every telephone user. They are the transmitter, into which a person talks, and the receiver, which is placed against the ear to receive sound from the distant station. The transmitter, Fig. 1, is constructed of a diaphragm, *D*, usually of aluminum, held in a case by some means not shown in the figure. Attached to the center of the diaphragm is a light brass bolt which runs to the center of an auxiliary diaphragm, D^1, which is made of mica. This mica diaphragm forms the front cover of a brass cup, which is held in place rigidly by a brass bridge, *B*, secured to the framework of the transmitter. Attached to the back side of the mica diaphragm is a thin disc of polished carbon, *E*, which is the front electrode of the cell. A similar carbon disc, E^1, is attached to the back wall of the brass cup and is called the back electrode. The space between the two is filled with granulated carbon, that is, carbon which has been reduced to very small particles, each of which is very hard and is highly polished. The wires are attached to the transmitter as shown in the figure, entering at the bridge, *B*, and leaving at the front electrode. Thus the path of a current of electricity will be as follows: entering on the bridge, *B*, it will pass through the brass work to the back electrode, E^1, from it to the granulated carbon and through to the front electrode, *E*, from whence it leaves by means of the wire soldered to the brass back of the electrode.

It is a well-known principle of electricity that the resistance of a contact between two conductors depends upon the pressure. A light pressure gives a high resistance, while a heavy pressure produces a low resistance. Within certain limits the resistance may be said to vary inversely with the pressure. It is upon this principle that the transmitter acts. Suppose the transmitter diaphragm to be quiet, and a battery to be connected to the wires. Then a perfectly steady current will flow through it. If now sound waves are allowed to impinge on the diaphragm, they will set it into vibration, and the motion of the metal will be an exact reproduction of the motion of the particles of air which constitute the sound wave. Since the mica diaphragm, D^1, is connected to the center of the main diaphragm, *D*, the former will share the motion of the latter, and there will result a varying

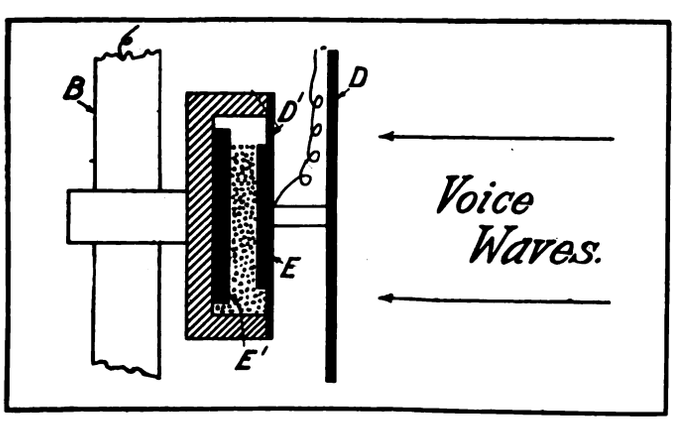

Fig. 1. Simplified diagram showing arrangement of transmitter parts.

pressure on the granulated carbon between the two electrodes. As the pressure rises, the resistance between granules will fall, and as the pressure falls the resistance will rise. Since the voltage in the transmitter circuit is constant, any change of resistance will affect the current. A lowering of resistance will cause an increase of current flow, while an increase of resistance will cause the current to fall. In this way the sound waves in air are enabled to regulate the strength of the battery current flowing in the transmitter, and cause it to undulate in exactly the same manner that the sound waves do.

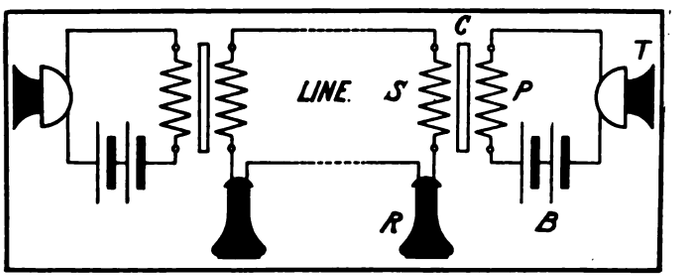

Fig. 2. Simplified diagram of direct line between two telephones equipped with induction coils.

Keeping this action of the transmitter clearly in mind, we will show how it is combined with the rest of the apparatus in sending speech. In Fig. 2 the essential parts of the talking set of a local battery telephone are shown. This is the kind of telephone which requires a crank on the box, to be turned to call central. Each instrument of this variety carries its own battery, which fact gives it the name.

The transmitter, *T*, is connected in series with the battery, *B*, and the primary winding, *P*, of the induction coil. This is called the primary circuit. The construction of the coil is as follows: On a soft iron core, *C*, made of a bundle of fine iron wires, is wound some rather coarse copper wire, insulated, in three or four layers. On top of this is wound a quantity of fine wire, hundreds of turns in number. The resistance of the primary is from half an ohm to 1½ ohms. The secondary winding varies from 20 to 40 ohms, with occasionally a case as high as 250 ohms. As shown in the figure, the secondary is connected in series with the receiver, and thence through wires to the line and to the distant station. Now consider the primary circuit. As long as the transmitter is quiet, the current will flow steadily. If sound waves strike the diaphragm, it will be set into vibration, which will regulate the flow of current, making it undulate with a wave form exactly like that of the sound. This undulating current in the primary winding of the induction coil induces an alternating voltage in the secondary winding, which causes an alternating current to flow through the receiver, to the line, and to the telephone at the other end of the line.

It will be seen that we are dealing with vibrations of various kinds. First, the motion of air particles; second, motion of the metal diaphragm and its connected parts; third, the varying pressure between the carbon granules, which is capable of being plotted as a vibration as much as any other; fourth, the varying resistance which as a vibration corresponds to the pressure wave; fifth, the undulating primary current; sixth, the varying magnetism in the iron core of the induction coil; seventh, the alternating current in the secondary winding and line, which is reproduced by the receiver at the distant end into motion of air particles, which the ear interprets as sound. In all these vibrations the form of the original sound wave is so accurately retained that the final result is an almost exact reproduction of the spoken word.

The receiver, by means of which the alternating current is translated back into sound, has for its basis a permanent steel magnet of horseshoe form, *M*, Fig. 3. Attached to each end of the steel magnet is a soft iron polepiece, *P*, *P*, around which is wound a coil of fine wire, *C*, *C*. These coils are connected in series with each other so that if a current be passed through them they will act together tending to magnetize or demagnetize the core, depending on the direction of the current. In front

*Abstract from a paper read before the Indiana Engineering Society, Jan. 19, 1907.

Digitized by Google

of the ends of the polepieces is a flat diaphragm, *D*, secured at its edges so that there is only a small air space between it and the polepieces. This diaphragm is made of soft iron, and is consequently attracted by the permanent magnet, *M*, so that it is slightly dished. The amount of this dishing is determined by the balance between the elasticity of the diaphragm and the pull of

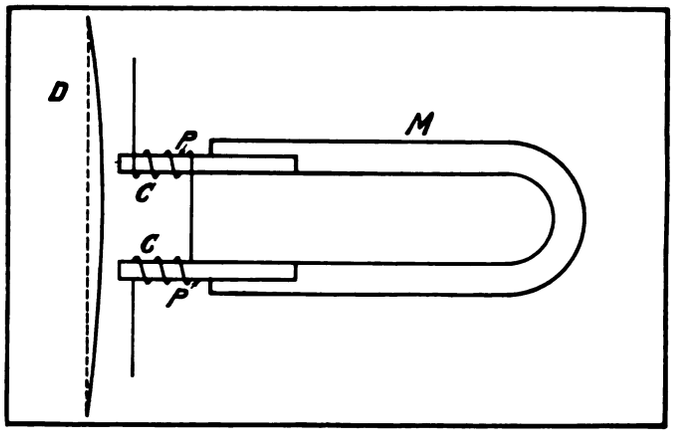

Fig. 3. Diagram showing the essential parts of an ordinary bipolar telephone receiver.

the steel magnet. Now let us see how this combination will act in connection with the circuit just described. The alternating current from the line will traverse the two coils of the receiver, and will of course change its direction of flow many times per second. While the current is flowing in one direction, let us suppose that it tends to strengthen the permanent magnet. This increases the pull on the diaphragm and makes it move toward the polepieces. As the current dies away, the diaphragm will return to its original position. When the current reverses and flows in the opposite direction, it will now oppose the permanent magnet, diminish the pull on the diaphragm, and allow it to spring a little farther away from the pole pieces. As this reverse current dies away the strength of the permanent magnet reasserts itself, pulling the diaphragm back to its original position. So for every cycle or complete vibration of the current, the diaphragm will make one complete cycle or vibration. It is this action that reproduces the sound into the air.

The question is often asked, "Why must there be a permanent magnet in the receiver, why would not a soft iron core do as well?" A little consideration will show that the soft iron will be magnetized equally well in both directions by the alternating current. This will produce two motions of the diaphragm toward the magnet and away again for each complete cycle of the current, so that instead of reproducing the waves of current wave for wave, it would make twice as many waves in air as in the current that produced them, thus failing to reproduce the original sound as desired.

One of the important points in transmission is the variation in the contact resistance of the transmitter. The exact range of the variation has been unknown, as no means have been found for measuring so rapidly changing a quantity. It is my good fortune to have been successful recently in measuring with approximate accuracy this resistance change. I have not the time to enter into a detailed account of the apparatus and description of the experiments, but the results are interesting. For a very weak sound the amplitude was about one-half ohm, the total steady resistance of the primary circuit being about 40 ohms. For louder sounds, the steady resistance increased to above 56 ohms, at which point the variation was about 12 ohms. Mathematical calculations are very successfully applied to all branches of engineering, and electrical power is no exception. The engineer can now calculate the entire performance of a dynamo or transformer before it is built. But with the telephone it has not been true. Cut and try methods have of necessity been used. But the time is coming when further improvements must be made, and it is my hope that the mathematics of the telephone may be so developed as to throw important light on present defects and indicate the way to improvement in a great many important matters

Among the parts of the signalling apparatus the bell is perhaps the best example of the neat application of electrical principles. Various types of bells have been used for calling, most of them being of the battery bell type, such as is used at the present time very largely for door bells, call bells, hotel calls, etc. As these bells all depend for their operation on the making and breaking of a contact which carries the current that energizes the magnets, they are not well suited for ringing over long lines. Battery power enough to ring them can be supplied, but the terrific sparking soon wears them out and causes endless trouble. These bells are therefore impractical for commercial telephone lines.

The polarized magneto bell has been found to be admirably adapted for the purpose, and is now universally used. It consists of an electromagnet, *S-N*, Fig 4, whose core is of soft iron, wound with insulated copper wire. Pivoted in front of the ends of the electromagnet is a soft iron armature, *n-n'*, to which is attached the clapper rod, which plays between the two gongs, *G-G*. The armature is magnetized by a permanent steel magnet *N*, only one end of which is shown in the figure. Owing to its position, this permanent magnet will magnetize the armature in a peculiar manner, giving the middle a south polarity, while both ends will be north.

Suppose the armature to be in the position shown in the figure and that the current is passing through the coils in the direction arrowed. The left pole of the electro-magnet will be south and the right pole north. Under these conditions, following the law "like poles repel, unlike poles attract," the armature will be forced down at the right end and up at the left, causing one blow on the right gong. If the current through the coils of the electro-magnet is reversed, the polarity of its magnetism will be reversed, making the left pole north and the right south. This will cause a repulsion at the left and an attraction at the right, so that the armature will be forced back into its original position. If the current continues to alternate, the clapper will vibrate indefinitely. The current for ringing this type of bell is furnished by a small alternating current dinamo ordinarily run by a motor which derives its power from the city lighting cir-

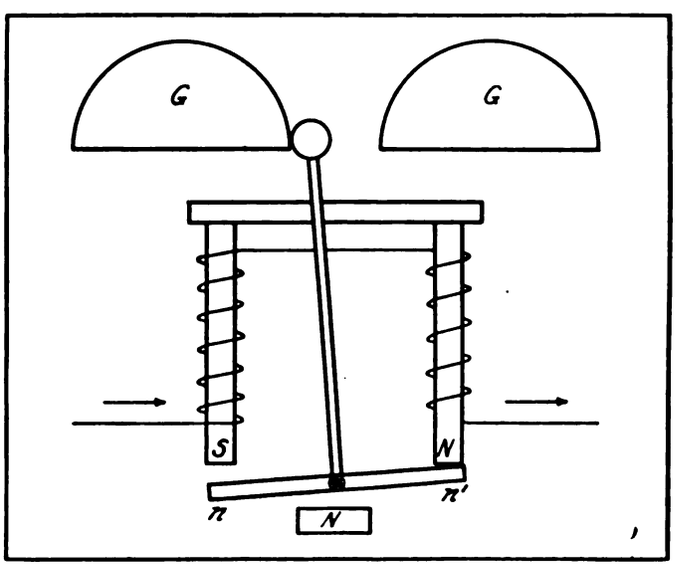

Fig. 4. General form of telephone bell to be rung by alternating currents, showing magnetic circuit.

cuits. As any form of alternating current will do, however, arrangements are frequently made for ringing these bells from batteries by means of a pole changer.

For signalling over long lines this bell is admirably suited. There are no contacts to spark or corrode and no springs to get out of adjustment. The current required is quite small, so that it is adapted to party line service.

PARTY LINE RINGING OVER TRUNK LINE.—(822.)

In a Bell exchange in our city the toll board is connected with the local board by a trunk line. Selective party line service is given, and I am told that only the local board is equipped with party line keys. At the same time they also tell me that the operator at the toll board rings any party she wishes to in the town. Will you please explain how this could be?

R. B.

FIG. 822 shows portions of a trunk circuit which is probably like the one you mention, and will enable you to understand how a toll operator can ring any party, even though the party line keys are located only at the trunk position on a board equipped with subscribers' multiple jacks. With each trunk is associated a party line key, which has connections for ringing the four parties by means of pulsating current, also for "straight" ringing on a metallic line with alternating current. The depression of one key lever rings on the "ring" side of the line with negative pulsating current to ground; the next key rings with positive pulsating current to ground on the same side of the line; the third with negative pulsating current on the opposite or "tip" side of the line, and the fourth with positive pulsating current on the "tip" side of the line. If no key is depressed the ringing current which, under proper conditions, goes out on the line, is alternating and adapted to ring a bridged bell.

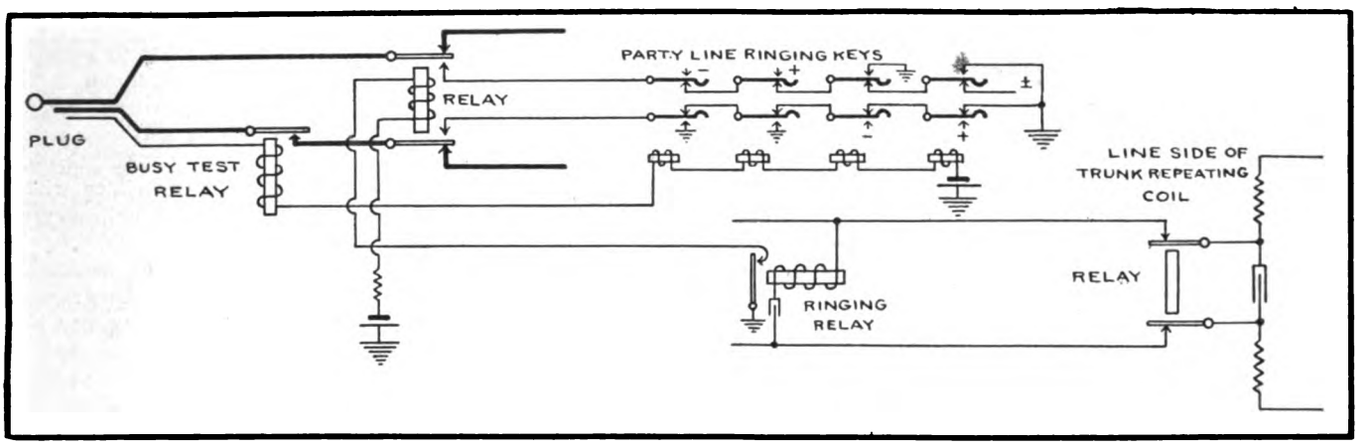

Fig. 822.

When the trunk plug is inserted in the multiple jack, one of the plungers on the party line ringing key is depressed, and it is locked in position. This locking is done by a special locking coil, one of which is associated with each plunger. This coil controls a small electromagnet mounted in such a way that an armature piece on the plunger of the key is brought opposite its poles when the plunger is depressed. The magnetic attraction between the core and the armature is sufficiently strong to hold the plunger in place against the tension of its spring while the coil is energized. This energization is effected through the sleeve circuit. The connection of the coils in series to negative battery is shown, and the circuit is completed through the busy test relay, sleeve of the plug, sleeve of the multiple jack, and 30 ohms resistance of the cut-off relay associated with the line to the grounded side of the battery.

When the operator receives over the order wire a call for a certain station on a party line, she inserts her plug, and repeats back the number of the trunk to the toll operator, and the toll operator plugs into a corresponding trunk jack at her position. In the meantime the local operator has depressed the plunger, thus setting the key for ringing the subscriber with the desired current.

Up to this time it will be seen that although the key has been set the ringing current cannot pass out to the line owing to the fact that the key is not connected to the line strands of the trunk cord. This connection is brought about by the operation of a relay, the armatures of which are connected in line strands in the manner shown. This relay is controlled by a second relay, which is adapted to be operated by ringing current from the toll positions. It is connected in series with a condenser, and bridged across a pair of leads carried to the side of the trunk repeating coil, which is connected into the trunk line circuit leading to the toll board in the manner shown in the diagram. When the toll operator rings, the armature of this relay is drawn up, grounding one side of the relay, which has its armatures connected into the local end of the trunk. As the other end of the winding of this relay is permanently connected to negative battery through proper resistance, the operation of the alternating current coil causes it to draw up its armature and allow the ringing current of a proper sign to pass out over one side of the line while the other side is grounded to provide a return path from the grounded bell.

The alternating current relay is constructed with a very heavy armature, which is so balanced that its mechanical inertia is too great to allow it to fall back during the brief interval when the relay is not thoroughly energized, owing to the reversal of current in its winding corresponding to the alternations of the generator thrown on the circuit by the toll operator. As soon as the toll operator releases her ringing key, however, this armature falls back, the relay controlling the springs connected into the trunk line circuit is de-energized, and the ringing current is disconnected from the line strands of the trunk. Owing to the fact that the party line key is maintained in its locked position, the toll operator may ring as many times as she wishes. It is thus seen that once the key is set she has absolute control over the ringing, and may call a subscriber as many times as she wishes by simply operating her ringing key.

CODE FOR RURAL LINE CALLS.—(823.)

Will your readers kindly give the best method for arranging rural line calls, that is, so that directory number will indicate line and ring?

THE AMERICAN TELEPHONE JOURNAL will be glad to have subscribers who have devised satisfactory codes for this purpose which cover heavily loaded rural lines send in descriptions of them. So many different codes have been devised that many subscribers will probably be interested in seeing some of them published, in order that they may have an opportunity to compare their merits. We would suggest that managers send in these codes as soon as possible. Payment will be made for such contributions as are published.

TECHNICALITIES THE REFUGE OF EMPLOYERS' LIABILITY COMPANIES.

THE desire of employers' liability companies to take business where there is no risk, to get out of it as soon as any risk appears, and to take refuge behind any trfling technicality in order to avoid meeting their just liability incurred under their policies is again illustrated in a suit that the People's Home Telephone Company, of Birmingham, Alabama, has been compelled to bring against the Ocean Accident and Guaranty Company. The policy had been in force only about four days when the accident in the case happened, and immediately upon notice of the accident, the guaranty company cancelled the policy, which it had a right to do, if it so desired; this act, however, showed its disposition to avoid all possible risks. The case has not yet come to trial, but it is understood that the guaranty company bases its defense on the following technicality: According to a city ordinance of Birmingham, the telephone company's wires are required to be a certain height above the ground. A severe electrical storm caused one of the wires to be burned off, and fall over a guy wire, and hang there, about ten feet in the air. A few hours afterwards, a boy came along, and seeing the wire, proceeded to pull it down with a stick, thus pulling it across a trolley wire, and burned himself. The guaranty company contends that the telephone company violated a city ordinance in permitting this wire to be below the required height, even for this few hours, there being a clause in the policy stating in effect that the insurance company is not to be liable where the insured violates an ordinance of which he has knowledge. The telephone company was obliged to pay $5,000 damages besides $250 expenses in defending the suit brought by the injured boy, and this it asks the guaranty company to reimburse. It remains to be seen what stock the courts will take in a defense of this kind.

FAIR GAME FOR THE PRESS AGENT.

ONE of the companies whose financial difficulties have been spread in reports through dozens of cities in an effort to discredit Independent telephone securities is the Orr Telephone Company, of Buffalo, N. Y. The decision of a referee denying the claim of the Rev. Francis J. Orr against the trustee of the Orr Telephone Company, in regard to the ownership of certain machinery and personal property, recalls to mind the rather interesting history of this much advertised concern. Originally this Rev. Francis J. Orr was the owner of patents on a new receiver which it was claimed would revolutionize the business of the country. In 1901 the Orr Telephone Company was organized with an authorized capital of $3,000,000. It bought the receiver patents, and the consideration named was $2,600,000. The inventions did not appeal to any of the large telephone companies, and an expert witness has testified that they were not worth more than $250. Immense stock jobbing operations were carried on for a time and the referee has stated that hundreds of confiding people were duped. When the firm finally went into bankruptcy all the assets that could be found were appraised at about $3,500, while the debts were in the neighborhood of $17,000.

Such are the facts concerning this concern, which has had its name mentioned so many times as "another Independent company which has gone to the wall." It never operated any telephone lines, and never manufactured any goods to be sold in the regular course of trade. Its sole business was to gather in cash for the Rev. Mr. Orr, another gentleman who had been a minister, and an ex-army officer who apparently associated on equal terms with his fellows who had fitted themselves for their duties while preaching from the pulpit.

That it should hold up such a concern as this as a sample of the Independent telephone companies throughout the country shows the weakness of the Bell press bureau. The real Independent companies, which are actually operating, doing an obviously successful business with substantial and visible assets, have got beyond the necessity of fearing the effects of such bits of misinformation.

LOADING UP THE RURAL LINES.

FARMERS are not always satisfied with the kind of service that pleases the city telephone subscriber. There are a good many communities where the long party line is thought to be the finest thing that could be built. A man who operates a fairly large telephone system in New Hampshire tells of one old gentleman who was on a line that had been gradually extended from one farm to another until it carried twenty-nine parties. Quite a number of these people were summer residents, who had come from cities where short rings and no "rubbering" were the rule, and they objected to the service they were getting. As a compromise measure a new line was run to take twelve of the instruments, leaving seventeen on the old number. This seemed to please nearly all, but this one particular old subscriber came in a few days later with a grievance. As he put it, "Before you changed that line over I had twenty-eight telephones right under my thumb. As 'tis now if Georgie here is selling five cents' worth of peppermints I've got to wait until he gets through before I can get those other twelve people." The manager of the company may have thought that the real trouble was that it was rather inconvenient to ask Georgie to connect the lines up for listening purposes, but nevertheless a special switch was put in which allowed the subscriber to cut in on either line.

These long party lines are all right for "visiting," but when a farmer wants to use them for business the question becomes more complicated. Where only four or five lines center at a switching point attendance at the switchboard must necessarily be more or less irregular. The recompense for switching service is not sufficient to make it more important than many other things which come up in the course of a day. If most of the calls are for neighbors, and there is little need of connections to outside points, there is a real advantage, even from a traffic standpoint, in putting on a line as many instruments as it can carry. Economy in building and in operation is possible, and if this economy results in low charges to subscribers it is appreciated by them.

Visiting at the present day is becoming one of the minor things in the usefulness of rural telephones. Business is supplanting the social feature during a large part of the day. The farmer is becoming aware of the value of his time, and objects to wasting it at a telephone. The many long rings required for calling certain parties on a heavily loaded line not only require a constant attitude of watchfulness on the part of the subscriber, but in the aggregate they take a large amount of time. During all this time when the line is being taken up for ringing it is, of course, useless for communication. Transmission is poor, and there can be no privacy on a heavily loaded line. Greed for profits should not be allowed to interfere with giving good service.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

COMPANY CANNOT REQUIRE A CONTRACT FOR ONE YEAR.

We have been having so much trouble with changing telephones for subscribers who have had them put in and kept them for only a few weeks or months at most that we are thinking of establishing a regulation requiring all subscribers to sign a contract for a telephone for one year before we install our instrument. Before taking this up we would like to have your opinion upon the legality of such a regulation. We also would like to know if we may require pre-payment of telephone rental in advance. G. W. A.

A TELEPHONE company may always require its charges to be paid in advance for a reasonable length of time, but there is no authority for a company requiring a year's contract. A telephone company, being a common carrier, is required to serve all who apply, and if one subscriber does not want the telephone for so long a period as another, that is no reason why he should be debarred from the service. It is therefore our opinion that you could not legally establish a regulation that a subscriber must sign a year's contract before you install a telephone. Such a regulation would not be held to be reasonable and would therefore be invalid.

DISCLOSING TELEPHONE MESSAGES.

Has a telephone company got to pay damages if one of its operators tells an outsider what a conversation over a wire was, and the outsider is in that way enabled to take advantage of a subscriber in a business way? In the case we have in mind the operator told a friend of hers what a subscriber had related to another subscriber concerning a contract involving a large amount of grain. The operator's friend was thus enabled to impersonate the other subscriber and obtain money from the first subscriber by false pretences. Subscriber number one is trying to make the company stand for his loss. S. G. M.

THE rule certainly is that it is the duty of a telephone company to refrain from disclosing the contents of a message which it receives for transmission. It is a public duty for such a company to preserve the secrecy of a message delivered to it for transmission, and if it is guilty of a wilful breach of this duty, it will be liable for all damages arising therefrom. We cannot say how far conversation over the wire is a message to be delivered by the telephone company, because it is held in cases of slander that to make a slanderous statement over a telephone amounts to a publication, and it might therefore be contended that a statement by a subscriber over a telephone was intended to be public and occupied a different position from a written or sealed message to be confidentially forwarded. A telephone company might further defend on the ground that the operator had no authority to disclose the message and so the company was not liable for the operator's conduct. A still further defense would be that the damages resulting were not such as would naturally be contemplated from the disclosure of the message because neither party would have the right to assume that any person was going to make fraudulent use of the knowledge thus obtained.

MAN'S TELEPHONE CANNOT BE TAKEN OUT BECAUSE HIS WIFE DOES NOT PAY HER BILLS.

A MISSISSIPPI planter sued the Cumberland Telephone and Telegraph Company for $2,000 damages for wrongfully cutting out his telephone service. His wife kept a store in which the company placed a telephone, the contract being signed by the clerk in the wife's name. The telephone in the residence was installed under a contract signed by the plaintiff himself. The wife sold the store at that time, there being a balance of $3.10 on the store telephone. After returning from a business trip, the plaintiff found his residence telephone removed. He called at the manager's office, tendered rental for the next month and asked to be put back on the line. This the manager declined to do on account of the indebtedness on the store telephone. He was without a telephone three or four months, and in his suit claimed to be damaged in many ways, but said it was difficult to enumerate the exact amounts and the ways in which he was damaged. One of the chief items for which he claimed damages was for having to send a boy to his house with packages instead of placing them on the car and telephoning some one at the house to get them. The jury rendered a verdict for one hundred and fifty dollars. The telephone company's defense was that it thought it was making the contract at the store with the man instead of the wife, but this the Supreme Court of Mississippi held made no difference for the reason that the company was bound to put in a telephone at the store at the request of either the husband or the wife. The court sustained the verdict for the plaintiff and held that the contracts were separate and independent of each other, and because of the failure to pay charges on one telephone, the company had no right to cut out the other. The rule is that the telephone company can only cut out that telephone for which there has been a default in payment. Discussing the matter of damages, the court held that the difficulty the plaintiff had in estimating his damages did not effect the case, as it was for the jury to decide how much he had suffered. Cumberland Tel. & Tel. Co. vs. Hobert, 42 S., 349.

RIGHT OF STATE TO CONTROL CONSTRUCTION.

It is provided in the law of our State (New York), as we understand it, that telephone companies have the right to erect and maintain their lines over the public highways of the State. A bill has now been introduced in the legislature, we think at the instigation of the Bell people, providing what the size and location of poles must be, the height of the wires and the angle at which they shall cross the highway. The regulations of the State in this bill are going to conform to the construction of the Bell people in this section, but do not conform to ours. If this bill goes through we will have to spend considerable money in getting our line up to the requirements, and this will, of course, be a great hardship after just having completed our construction. What bearing does the State law giving us the right to build our lines have upon this new bill? Doesn't it prevent the State from passing any new ordinances on the subject? We have built relying on our right under the law first quoted, and think it would be an injustice to cause us to change now. Would not this be legislation impairing the obligation of contract? C. B. W.

WE appreciate the fact that the proposed legislation is very unjust and should be defeated if possible, particularly if passed in the interest of the telephone monopoly as you state. Every effort should be made to kill the bill in its passage because if it once becomes a law it would probably be valid. The State in granting a telephone company the right to construct its lines over public roads does not thereby relinquish its control over the exercise of such right. Neither does the State deprive itself of the right to exercise the police power in any way. The granting of the right to use the public roads is done with an implied reservation that the State, nevertheless, may regulate the use and location of the poles, the heights of the wires and their location. Should the poles become a nuisance or obstruction on the highway, the State could then remove them or require that they be placed underground. Am. Rapid Tel Co. vs. Hess, 125 N. Y., 641; 13 L. R. A. 454; 21 A. S. R. 764.

IN THE OPERATING FIELD

KANSAS CITY FIRE DEPARTMENT DISCONTINUES USE OF BELL TELEPHONES.

SOME weeks ago the Fire Department of Kansas City had a private system installed, with connections to the exchange of the Home Telephone Company made through a branch exchange switchboard at its headquarters. A Bell telephone was placed beside the Home board, and whenever any subscriber for Bell service sent in a fire report it was expected that the message would be transmitted to this single instrument, and notification sent to the proper station over the lines of the Fire Department branch exchange, installed by the Home company.

It is said that the Bell Company objected to allowing its lines to be used in this way, and continued to have alarms turned in directly to the various stations where it had single instruments. The officials of the Fire Department objected to this interference with the routine they had established without avail. The latest report is that the wires of the Bell company to all the instruments in the stations throughout the city were cut by order of the Board, and that in this way it will compel the exclusive use of the Independent system for the giving of fire alarms.

TROUBLE FOR CUMBERLAND COMPANY PILING UP —A NEW INSTANCE OF ALLEGED POOR SERVICE IN TENNESSEE.

THE city council at Trenton, Tenn., recently notified the Cumberland Telephone Company that its service in that place was becoming intolerable because of antiquated instruments and exchange, and requested that a new exchange, switchboard, new instruments, etc., be supplied within a reasonable time. "If you do not in a reasonable time comply," the notice continues, "we will tax every pole in the city limits $3 apiece." Since the company was operating in that place on a State franchise, the council had no recourse but high taxes, which right it has by legislative enactment. Even since this positive demand the Cumberland company is said to have failed to improve its service.

NEW HAMPSHIRE CONSIDERING BILL GRANTING EQUAL TERMS TO TELEPHONE COMPANIES IN RAILROAD STATIONS.

INTRODUCED by Mr. Tilton, of Laconia, House Bill No. 279, in the Legislature of New Hampshire, provides that every railroad corporation or express company doing business in the State shall grant every individual or organization doing a telephone business with more than five hundred subscribers equal and reasonable terms with any competitor in its depots, station houses, offices, etc.

INDEPENDENT SERVICE REPLACES BELL AT YOUNGSTOWN, O.

CHAIRMAN HEINSELMAN, acting under authority of a resolution of the public service board of Youngstown, recently directed the manager of the Bell Telephone Company to remove all its instruments from public offices. This action was taken because the Central Union (Bell) Company was charging higher rates for service with a smaller number of subscribers than the Youngstown Telephone Company.

After a long consultation between the local manager and the headquarters of the company at Indianapolis, it is said the company decided to leave in the city offices without charge, the fifteen or twenty instruments which it has in service. It was unwilling to withdraw the instruments, but believed that a reduction of its rates to the city would bring about a corresponding necessity of lower charges to business men. Since the matter has been brought up by the city government, however, business men have come to realize that the Independent service satisfies all their needs, and is much better than that furnished by the Bell Company. A great many of them are therefore preparing to use it exclusively. Others feel that the city's present bargain is much better than the one it had before, and are laying their plans to secure a similar advantage for themselves.

OREGON CONSIDERING THE REGULATING OF TELEPHONE BUSINESS AND RATES.

HOUSE BILL NO. 126, introduced in the Legislature of the State of Oregon, provides for the appointment of a commission for the regulation of telephone business. Under the terms of the act, as now being considered, the Governor, Secretary of State and the State Treasurer shall constitute this commission, and shall have full power to fix rates, and adopt such rules for the regulating of the business as they may consider fit and necessary.

NORTH DAKOTA INDEPENDENTS MEET AT GRAND FORKS.

ON January 16th representatives of many Independent telephone companies met at Grand Fords, N. D., to discuss questions of development, and other matters of interest. Among those present at the meeting were A. B. Cox, Valley City, secretary of the North Dakota Independent Telephone Co.; John Carmody, Hillsboro, Hillsboro Telephone Co.; L. D. Richardson, general manager of the North Dakota Independent Telephone Co.; W. F. Baillie, Hunter, Hunter Telephone Co., and Mr. Lain, Kensal, Kensal Telephone Co.

Considerable attention was devoted to a project for a general meeting of Independent men in the state to be held next May in Fargo or Grand Forks. At this time it is proposed to form a regular organization of all the Independent companies of the state for the mutual protection and benefit of all persons associated with the movement.

BOOK REVIEW.

THE TREATMENT OF STORAGE BATTERIES, by R. W. Vicarey. Fifty-eight pages; illustrated with line drawings. Published by the Electric Accumulator, 15 Queen street, Cheapside, London, E. C., England. Price 2s. 6d. net.

This book is designed especially for practical men who, without previous experience, may be called upon to secure good results in the installation and management of storage batteries. It takes up in an exceptionally complete form, for a book arranged for readers of this class, the various considerations for the choice of a battery for a given class of work, the selection of a battery room, installation of cells and management and locating and clearing of troubles which are liable to occur. The arrangement of chapters is, from a practical standpoint, especially commendable.

NO FAULT IN DUPLICATION HERE.

OUR Bell friends who go into the publishing business as a side line devote a great deal of space to misinformation, printed, we imagine, very largely for the amusement of the sub-licensee companies who are waiting for Independent toll lines to be built. Occasionally, however, they show a keen appreciation of the humors of the situation, as is evidenced by the following from the *Wisconsin Telephone News*:

"A traveling salesman called on a merchant in a town where there are two telephone systems and asked him to go round to the hotel to look over his samples and lunch with him. The merchant accepted, but said 'Wait until I telephone my wife that I won't be home to lunch.' He went to where both tele-

Digitized by Google

phones were on the wall side by side, took down both receivers and after a moment talked with his house. As he turned from the telephone the traveling man said: 'I beg your pardon, but I am curious to know why you tried to use both telephones at once?' 'Oh, that's easy,' said the merchant, 'the one that gets there first gets the business.'"

MEETING OF INDEPENDENT TELEPHONE MEN IN SOUTHWESTERN IOWA.

ON JANUARY 28 the members of the Southwestern Iowa Independent Telephone Association met at Council Bluffs. One of the objects of this meeting was the extension of the clearing house movement among Independent telephone companies in this section of Iowa, as well as the reorganization of the association, including the election of officers. The officers of the old association were chosen to continue in their places after its reorganization as follows: H. A. Kinney, Woodbine, president; J. F. Glenn, Denison, secretary and treasurer; C. H. Smith, Sioux Sity, delegate to the International Convention, with M. A. Reed, Woodbine, as alternate. The president named county captains as follows: J. F. Glenn, Frank McNally, M. A. Reed, G. A. Lanbach, S. B. Barnes, John Anderson, George Atkinson, J. G. Beachamp, A. M. Murphy, F. M. Chandler, J. C. Mansfield, L. E. Simpson, Jesse J. Whistler, H. H. Driftmier, and F. C. Musson.

The members who were present gave very satisfactory reports of their business during the past year. The opening of the new Independent exchange at Council Bluffs, the granting of a franchise to an Independent company at Omaha, and new toll lines have given a decided impetus to Independent development, with good prospects of continued rapid growth.

GOOD WORK OF HOME TELEPHONE COMPANY AT ROCKFORD, ILL.

R. H. GIBBONEY, superintendent and manager of the Home Telephone Company, of Rockford, Ill., in his annual report shows that his company has made a very satisfactory growth. Not only have two hundred new telephones been added during the past year, but orders are taken for nearly as many more. These will be installed as soon as the material, now on the way, can be put in place. New residence buildings have called for a great many telephones, and the business districts have not failed to give their share of the business. One big building alone, which is being erected, will call for a great many instruments, as the company has planned for the installation of one hundred telephones in this building alone.

Not only has the local business been well developed, but the scope of the service has been considerably extended by connection with outside companies, among which may be mentioned those operating in Jo Daviess, Stephenson, Boone, Ogle, Carroll, Whiteside and Lee counties. The various companies concerned expect to build in the near future a new copper toll line, which will connect the county seats of these various counties.

ATTENDANCE AT THE MEETING OF TEXAS INDEPENDENT TELEPHONE ASSOCIATION UNUSUALLY IMPORTANT.

MEMBERS of the Independent Telephone Association of Texas are urged to make every possible effort to attend the convention which is to be held February 21 and 22 at the Exchange Building of the Fort Worth Telephone Company, Fort Worth, Texas. The Legislature of the State is considering several bills, the passage of which would be exceedingly injurious to the interests of the telephone companies. It is of the utmost importance that all telephone men in the State should get together and devise plans for the enlightenment of the legislatures on the important questions with which they must deal. Any company which fails to send a representative to this meeting has no cause for complaint if it is later compelled to suffer by detrimental legislation.

SUPREMACY OF INDEPENDENTS IN OHIO SHOWN BY FIGURES FROM EACH COUNTY.

PRESIDENT FRANK L. BEAM, of the Ohio Independent Telephone Association, has recently issued a report which shows how far in advance Independent telephone companies are of their Bell rivals in the State of Ohio. These figures were gathered very carefully from reliable sources, and the association believes that they are very nearly correct. At the end of the report the figures in which we have reproduced in the table at the foot of this page, is a statement showing the growth of Independent companies in the State of Ohio since the issuing of the first official report by the association on March 30, 1905, as shown by the following figures:

		Exchanges.	Toll Stations.	Stockholders.
March 30, 1905.....	196,937	668	1,452	17,029

Statistical Report of the Ohio Independent Telephone Association, showing Development of Bell and Independent Systems, Oct. 30, 1906.

Digitized by Google

TELEPHONE PATENTS

POLE SPLICING DEVICE.

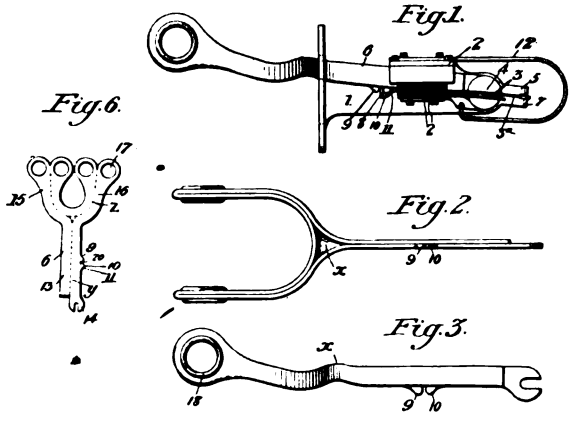
Frank Neal Drane, Corsicana, Texas, patents (No. 841,489; dated January 15, 1907; filed May 26, 1906; serial No. 318,837) a pole splicing device.

This invention covers a bracket-like member adapted to fit closely against the surface of a pole, and carrying on its inner surface a lug for engaging a hole formed in the pole. Pairs of these clamping blocks are set in the butt and the pole respectively, in vertical alinement, at intervals around the two portions to be spliced. The bracket members are then joined by bolt rods which clamp them firmly together. Each pair of brackets so joined by the bolts forms a supporting device, which tends to maintain the pole in an upright position. In order to prevent lateral movement the centres of the pole and butt respectively have bored in them a vertical hole into which is set a dowel.

SWITCH HOOK.

Ray H. Manson, Elyria, O., patents (No. 841,993; dated January 22, 1907; filed December 2, 1905; serial No. 290,039) and assigns to the Dean Electric Company, Elyria, O.,) a switch-hook.

The main switch lever 6 covered by this patent is designed to operate in connection with a switch of the type shown at the right of Fig. 1, covered in patent serial No. 200,899. A blank of the form shown in Fig. 6 is stamped out of sheet metal. It comprises a relatively long shank 13, having at one end a notched ear 14, preferably disposed to the right of the median line y. This is designed to engage the stub lever 5. At the opposite end of the shank the body is bifurcated to form separate legs 15 and 16, of a form indicated in Fig. 6, and each leaf is punched out to form apertures 17, for the reception of annular rivets 18. Lugs 9 and 10 form a notch 20, which is engaged when in operation by tongue 8 of the stub lever 5. Ear 10 is provided with a cam 11, which depresses tongue 8 and the



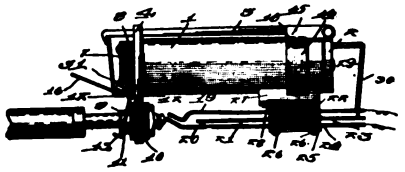
forward end of the lever 5 when the main hook lever is pushed in place. Actuating spring 12 engages a notch formed in the lower side of the stub lever, so as to normally force tongue 8 into engagement with and to raise the main lever 6.

After the blank is, by suitable pressure, folded along the lines y z, as shown in Fig. 2, so as to double the thickness substantially throughout the entire length of the shank and legs, which ordinarily form the weakest part of the hook, the hollow rivets 18 are used to secure the folds together, their form giving the completed hook a finished appearance.

EXPRESS DROP.

Martin V. Mehren, Genoa, Ill., patents (No. 842,409; dated Jan. 29th, 1907; filed June 2, 1904; serial No. 210,844) and assigns to Eureka Electric Co., Chicago, Ill., an express drop.

In this patent for a combined switchboard jack and mechanical self-restoring drop, the construction covers a ring lever, 13, which embraces the outer projecting end of the socket, 11, associated with the jack. This lever is pivoted upon opposite sides of the jack socket, as shown at 14. The lower end of the lever is pro-



vided with an outwardly bent portion, 15, and its upper end is provided with pads of insulation, 16.

When the operator plugs into the jack she causes the shank of the plug to strike the lower end, 15, of the lever, which causes it to swing upon its pivot so that its upper end acts outwardly against the lower end of the drop shutter, 9, which it restores to its former position.

COMBINED TELEPHONE AND ALARM SYSTEM.

Harry G. Webster, Chicago, Ill., patents (No. 825,623; dated July 10, 1906; filed April 26, 1904; serial No. 204,978) and assigns to Milo G. Kellogg, Chicago, Ill., a combined telephone and alarm system.

In this patent the inventor gives general specifications for systems in which telephone circuits extending from a telephone exchange to subscribers' stations may be utilized for the transmission of fire, burglar or other alarm signals. Briefly the scheme is the use of a telephone line circuit in connection with special arrangements by which a substantially continuous flow of current is maintained in the circuit except when interrupted by the alarm sending apparatus. The interruption causes special signals to be received at the telephone exchange.

The specifications include several pages of descriptive matter and 38 drawings illustrating the application of the invention to various practical conditions stated by the inventor.

TELEPHONE SYSTEM.

Alfred H. Weiss, Evanston, Ill., patents (No. 841,292; dated Jan. 15th, 1907; filed Sept. 3rd, 1904; serial No. 223,198) and assigns to the Kellogg Switchboard & Supply Co., Chicago, Ill., a telephone system.

This patent covers a telephone line adapted to the use of a lamp signal in a magneto exchange. The line circuit is similar to that shown in patent No. 836,541, covering a cord circuit, described in AMERICAN TELEPHONE JOURNAL, issue of December 29th.

At the sub-station is a local battery instrument provided with a generator for calling. Line wires terminate at the exchange on tip and ring springs of the jack. The sleeve and normal contact associated with the tip spring are grounded. Permanently connected to the ring side of the line is a leg to a contact of a relay adapted to be brought into connection with ground, when the relay is operated, as the armature associated with this contact is grounded. One side of the relay is connected to the normal con-

OUR '07 CATALOGUE SENT ON REQUEST

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE—1,000 Kellogg magneto telephones; Viaduct Mfg. Co. ringers; Wabash Cabinet Company's back boards and battery boxes. Good condition, almost new. Will sell singly or in lots. For particulars, write Kinloch Telephone Company, C. W. Shands, Purchasing Agent, St. Louis, Missouri. 755

FOR SALE—Cheap; 100 telephone instruments, all warranted in good condition and to work. Address Melendy Telephone Co., So. Londonderry, Vt. 779

FOR SALE OR EXCHANGE—One Illinois direct reading ohmmeter 0 to 10,000 ohms; one Williams Abbott bridging 1600 ohm test set. Address Box 780, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 780

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

WANTED—A man with three years' experience as switchboard installer and four years as Superintendent of Construction, wants a position as Manager or wire chief of a common battery plant. At present employed as installer but is married and desires a local position. West or northwest preferred. Address Box 774, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 774

WANTED—Married man with five years' experience desires position as manager or troubleman. Three years with present company. A-1 references. Open March 1. Address Box 772, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 772

WANTED---Continued

WANTED—A telephone manufacturing engineer and manager, to take charge and promote a small concern. A thoroughly capable man is required. Address, Box 777, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 777

WANTED—Position by married man of 26 as manager of common battery exchange in a town of about 5,000 or more. Have built and managed complete exchanges. Salary reasonable. Address Box 778, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 778

WANTED—Well educated young man, good appearance and references with some telephone experience. Write fully. Address Box 727, care THE AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 727

Digitized by Google

PATENTS—Continued.

tact associated with the ring of the jack, while the other goes through the line lamp to ground. Between the line lamp and the relay is a tap to a second armature contact. When the relay is operated this contact is connected to an armature wired to the negative, ungrounded side of the battery.

It is evident that when the subscriber rings, current will operate the relay, which will be held up over the locking circuit by the battery current, and the lamp will remain lighted until the operator plugs in.

Once the relay is operated, provision against its deënergization by an opposing wave from the hand generator is made by the shunt to ground through the leg from the ring side of the line and the relay armatiure. The insertion of a plug by the operator opens the relay from the line at the normal contacts of the jack. This allows the armature to fall back to put out the line signal.

SECTIONAL POLE.

Henry M. Sciple, San Francisco, Cal., patents (No. 841,344; dated January 15, 1907; filed February 10, 1906; serial No. 300,409) a sectional pole.

The invention covers a sectional pole composed of a series of angle iron members, with the angle edges pointing inwardly. Each of these members has at its lower end divergent feet, which may be secured to a base plate adapted to be set upon the ground, and anchored in any suitable manner. In order to hold together the several uprights partition plates are set within the angle irons at intervals in the length of the pole. These are provided with angular recesses to snugly receive the uprights. For obtaining the desired taper partition plates of different sizes are used, the smaller being placed near the top. Outside the angle irons, in the same plane with each partition plate is set a clamping ring to hold the uprights permanently in engagement with the recesses of the inner plate.

LISTENING APPARATUS FOR TELEPHONE EXCHANGES.

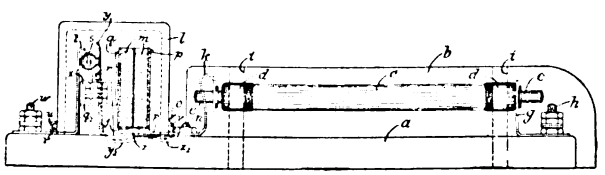
William W. Grigsby, Lawhon, La., patents (No. 841,244; dated January 15, 1907; filed June 12, 1906; serial No. 321,396) a listening apparatus for telephone exchanges.

The object of this invention is to provide a means whereby the chief operator may secretly listen to conversations carried on over the lines. Mounted in a circular formation upon a base are pairs of switch contacts, each pair being connected to the terminals of the secondary of an induction coil. The primary of this coil is connected in series with one of the wires composing a telephone line. The terminals for the listening operator's set are carried to a rotating arm having a pair of brushes adapted to be brought in contact with a pair of terminals associated with any line on the rotation of the arm.

SUBSTATION PROTECTOR.

Frank B. Cook, Chicago, Ill., patents (No. 842,628; dated January 29, 1907; filed March 12, 1906; serial No. 305,599) a substation protector.

This patent covers a protector in which tubular fuses *c c*,

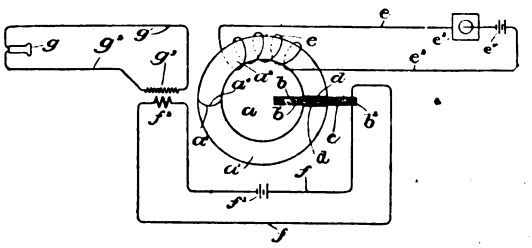


lightning arresters *m m*, and heat coils *s s* are all mounted on an insulating base of porcelain, *a*, being held in place by suitable contact springs. Between fuses *c c* is a rib, *b*, of insulating material, to prevent an arc from jumping across. The glass cover *l* is placed over the lightning arresters *m m* and thermal protectors *s s*. The line is preferably attached to posts *h h*. When a strong current comes in, it blows the fuse *c*, and disconnects the circuit to instrument. When a sneak current comes in, it causes thermal protector *s* to operate, releasing spring *y*, which flies back and makes contact with the ground strip at *q*. A high potential current discharges through the dielectric of the carbon lightning arresters to the spring *q* connected to ground. The instrument is thus designed to furnish protection against the three typical forms of dangerous currents liable to be set up in a telephone line.

TELEPHONE RELAY.

Albert L. Parcelle, Boston, Mass., patents (No. 843,296; dated February 5, 1907; filed October 12, 1900; serial No. 32,871) a telephone relay or repeater.

In this type of relay there is provided a circular magnet *a*,



divided into two sections a^1 a^2. It is designed to be mounted vertically, and the lower section a^1 is permanently magnetized, while the upper section a^2, bearing coil *e*, is of soft iron. In an opening in the ring is inserted a microphone *d*, containing between its electrodes *b* b^1 finely granulated carbon.

When the current in coil *e* is varied by the transmitter e^3 the magnetic flux throughout the ring changes in correspondence. As the two portions of the ring are pivotally secured together at a^3 a^4, the upper portion of the ring is caused to alternately approach and recede from the permanently magnetized division, effecting changes in the pressure between the electrodes *b* and b^1. These changes affect the resistance of the granular carbon, producing current changes in the circuit including battery f^3 and primary winding of induction coil f^2. These variations are transmitted to the secondary, g^3, from which they pass to the receiving line.

TELEPHONE MECHANISM.

Robert A. Davidson, Santa Cruz, Cal., patents (No. 835,181, dated November 6, 1906; filed May 14, 1906; serial No. 316,711) a telephone mechanism.

This invention is intended to provide means whereby when a subscriber leaves his receiver off the hook a signal may be transmitted to the central office and the operator at the central office, upon receipt of such a signal, may operate means for automatically opening the talking circuit which may again be automatically closed upon the return of the receiver to its proper place.

An electro-magnet is provided at the sub-station. This has two windings, one adapted to be controlled by the receiver hook and the other by the current passing from the central office to a local ground in which an end of one winding terminates. Should a subscriber fail to hang up the receiver after having used the telephone the circuits and apparatus are so arranged as to transmit a signal to the central office. At the same time the apparatus at this particular station is placed in a position to receive a special current sent out by the operator at the central station for the purpose of opening the instrument circuit to prevent interference with other subscribers on the same line. When the subscriber replaces his receiver the circuits will be restored to their normal condition.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

A SINGLE COIL RINGER.

A SAVING of space in the telephone box and simplicity of mechanism are two of the principal advantages which are claimed by the Electric Manufacturing and Equipment Company, of Atlanta, Ga., for the Wotton Single Coil Ringers. The mechanism of this ringer is shown in the accompanying illustration. The armature is mounted within the coil, which is wound upon an insulating tube. The magnetic circuit is completed through pole pieces which extend for a considerable distance along the magnet, and are maintained in perfect contact with it, being held to each pole of the magnet by a screw. The gongs are rigidly secured to extensions of the frame. The economy in space is evidently due to the fact that with a total length the same as that of the double coil ringer the width of the mechanism is little more than half. This permits of an arrangement of other apparatus in the instrument cabinet which gives ample room for obtaining access to the parts, or the removal of them, without disturbing connections, even if a smaller box than is customary be used for mounting the apparatus ordinarily comprised in a set.

The simplicity of the mechanism in this type of ringer is made evident on examination of the illustration. The company claims that it has been carrying on the experiments which have led to the development of this type of ringer for more than six years, and the result is an extremely efficient piece of apparatus. An interesting feature is its adaptability to varying frequencies, as the company states that it will operate clearly on an alternating current of from two to sixty-six cycles. Further information can be obtained by writing to the manufacturers.

The Wotton Single Coil Ringer.

T. J. COPE, 3244 North Fifteenth street, Philadelphia, Pa., manufactures a type of conduit rod which has a very efficient joint. The two parts of the rod may be instantly put together, and when once in place they are firmly locked, so that there can be no lost motion. These rods are made in three and four-foot lengths. Prices and further information may be obtained from the manufacturer.

JULIUS ANDRAE & SONS COMPANY, 99 West Water street, Milwaukee, Wis., is furnishing a great many condensers of a type which may be mounted upon the wall beside a telephone instrument, for use on rural party lines. This instrument is fastened in place with an ordinary screwdriver, and connections are carried to receiver posts in the telephone. The receiver is then attached to binding posts on the condenser. The apparatus is mounted in a neat case, and as it may be set close beside the telephone does not present an unattractive appearance, or interfere with the handling of the receiver.

The advantage in its use is due to the fact that, in an instrument not so equipped, when a receiver is removed from the hook any subsequent rings on that line will be short-circuited through the receiver, and will not actuate the bell of the desired party. When the condenser is used, however, the resistance to the ringing current is very much increased, so that it will take a path through the bell in preference to that through the condenser and receiver. The high frequency talking current does not meet the same impedance, so that the ability to hear well is not affected by the use of this device. The company will send full information, including diagrams for connecting to various types of telephone circuits, upon receipt of a request.

FRANK B. COOK, 238 West Lake street, Chicago, Ill., claims some very important advantages for his new No. 10 Protector for central offices. Among these perhaps the most important is that the heat coil is not made of wire, and therefore cannot be burned out or short circuited. Loose connections are avoided in the protector itself by doing away with all bolt connections for transposing line and switchboard terminals. This is the type of protector of which 16,000 pairs were installed at the new St. Louis office upon a single rack. A descriptive bulletin has been prepared which will be sent to all interested persons.

THE UNITED STATES COIN REGISTER COMPANY, Toledo, O., is prepared to send out some very interesting information about the United States combined cash register and pay station. This pay station is furnished with a tape upon which a record of the amount of every deposit is made automatically. This tape is automatically cut off and deposited in the cash drawer when collection is made. It furnishes a record which enables the accounting department to have an absolute check upon all collections, and avoid errors and disputes. The company will send full information upon receipt of a request.

THE MONARCH TELEPHONE MFG. COMPANY, Chicago, Ill., has developed a drop signal for use in connection with ordinary telephone ringers. It is especially useful in places where more than one bell must be mounted in the same room. When the bell rings a shutter is released by the movement of the striker, and remains in an indicating position until it is restored by hand. This enables the person whose attention has been called to the ringing of the bell to know immediately upon which line he should make connection, avoiding the necessity of listening in on each line until he finds the person who has called him. This apparatus is mounted in connection with jacks to provide an arrangement which permits the switching of a single talking set to any one of the desired lines, a combination which is especially useful when rural lines from several subscribers terminates in one place. Full information concerning this apparatus may be obtained by writing to the company.

THE NORTHERN ELECTRIC AND MACHINE COMPANY, Brooklyn, N. Y., has engaged to handle the entire output of creosoted pins and brackets manufactured by M. P. Osborne & Son, of Camden, N. Y.

THE W. G. NAGEL ELECTRIC COMPANY, Toledo, O., in the February number of the *Electrical Times* prints the usual current price summary, which gives latest prices upon construction material, wires, batteries, etc. This feature of the paper is especially interesting to all telephone managers and superintendents of construction, as it enables them to keep close track of the market and secure accuracy in all estimates. An interesting article in this number shows the danger of stringing telephone wires on the same poles with those bearing currents at a high voltage.

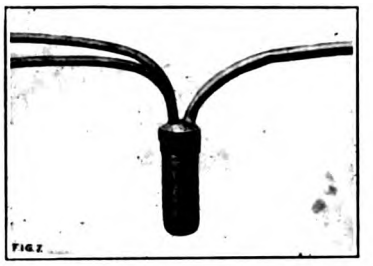
LIVERMORE PAY-STATION CO.

4 Bowker Street BOSTON, MASS.

A MONEY SAVER S



A MONEY SAVER S

YOUR MONEY

will earn more in direct proportion to the wisdom of your investment of it.

If you could splice your cables better and for less money, you would do it? It would be a wise move to adopt a device that would accomplish this result for you. A good investment.

If your regular lineman could make a better splice, absolutely watertight and airtight, you would like to let him do it? You would welcome the chance to buy a device that would enable you to get away from the heavy cost of horizontal splices.

When "shooting trouble" you would like to get away from the necessity of tearing open your horizontal splices that cost you so much money and will cost you nearly as much to repair?

HOW TO INCREASE IT

Let us send you descriptive matter of the Hargis Cable Splicing Joint shown above. Your regular lineman can make a better splice, quicker, at much less cost than an expert cable splicer can make a horizontal wiped joint. This will increase your money. By using the Hargis Cable Splicing Joint you save cable; you save labor; you save money; you can always get at your pairs without spoiling your splice when "shooting trouble."

It will pay you to write us for descriptive matter.

NEW COMPANIES.

PARAGOULD, ARK.—An Independent Telephone Company is being formed at Paragould to construct lines connecting this city with Marmaduke, Rector, Greenway, Piggott and the surrounding country. The system will give Paragould connection with about seven hundred telephones.

LOS ANGELES, CAL.—Articles of incorporation have been filed by the Union Home Telephone & Telegraph Company, with headquarters at Los Angeles. The incorporators are J. M. C. Marble, of Los Angeles; John E. Marble, of Pasadena; J. E. Fishburn, of Los Angeles; Geo. Ellis, J. V. Baldwin, John Van Liew, F. W. Wachter, of Los Angeles; A. K. Detweiler, of Toledo, and A. B. McCutcheon, of Los Angeles. The authorized capitalization is $10,000,000, and the sum of $150,000 has been subscribed. It is proposed to build telephone and telegraph lines from San Diego to Los Angeles and Bakersfield, from Los Angeles to San Bernardino, Santa Barbara and other places. The filing of this incorporation follows the reorganization of the Home Company some time ago.

MONTROSE, COLO.—A Co-operative Telephone Company has been organized to construct lines from Colona to Montrose, and the following officers have been elected: A. R. Walker, president; A. G. McDonald, vice-president; E. J. Shepherd, secretary; T. Topliss, treasurer.

CHICAGO, ILL.—The Chicago, Indiana & Eastern Long Distance Telephone Company, Chicago, has been incorporated with a capital stock of $5,000. The incorporators are C. H. Poppenhusen, J. L. McNab and William G. Hamilton.

GREENVIEW, ILL.—It is the intention of the Sweetwater Telephone Company to incorporate, and the following officers have been elected: R. Grimsley, president; John Terhune, vice-president; John Brassfield, secretary; Lee Stone, treasurer.

DUPONT, IND.—Articles of incorporation have been filed by the San Jacinto and Dupont Telephone Company, and the following are among the incorporators: W. D. Carson, C. Hoffman, Edward Eble and Thos. Hall. It is the company's intention to build lines and establish exchanges throughout Jennings and Jefferson counties.

LYONS, IND.—Articles of incorporation have been filed by the Lyons Co-operative Telephone Company. It has an authorized capital stock of $10,000, and the directors are John Davidson, G. W. Carpenter, W. D. Boyd, Helmer Holmes, Willard Webster, George Bogard, W. W. Clogston, Emil Pein and George Davidson.

UNION MILLS, IND.—An Independent telephone company has been formed by the farmers about Union Mills, and the following officers elected: President, F. B. LeSourd; vice president, Wallace Nichols; treasurer, C. F. Stephenson; secretary, Alva Stephenson.

DEXTER, IA.—The Mosher Mutual Telephone Company, with its principal place of business in Harrison township, P. O. address Dexter, has been incorporated with a capital stock of $5,000. It is its intention to construct and operate telephone lines in Adair and the adjoining counties, and the following are among the incorporators: Geo. Elliot, G. E. Sellers, H. C. Minor.

HOLSTEIN, IA.—The Advance Rural Telephone Company, of Holstein, has filed articles of incorporation. Its capital stock is placed at $25,000, and W. F. Hutton and others are the incorporators.

IOLA, KAS.—A Farmers' Telephone Company has been organized at Iola, Kas.

ONONDAGA, MICH.—The Onondaga and Leslie Telephone Company has been incorporated with a capital stock of $800. The officers of the company are: President, H. Baldwin; vice president, A. De Laur; secretary and treasurer, F. C. Baldwin.

NOTTINGHAM, N. H.—Articles of incorporation have been filed by the Nottingham Telephone Company.

SINCLAIRVILLE, N. Y.—The Sinclairville Independent Telephone Company has been incorporated with a capital stock of $5,000. Among the incorporators are E. J. White, C. N. Love, C. C. Febber, South Stockton.

BOWDON, N. D.—An Independent telephone company is being formed by the business men of Bowdon, and it is the company's intention to build a number of rural lines.

ZELMA, OKLA.—Articles of incorporation have been filed by the Beaver & Cimmeron Valley Telephone Company of Zelma and Englewood. It has an authorized capital stock of $5,000, and the incorporators are A. J. Sands, Ottis Barley, W. L. Detwiler, of Zelma; F. M. Mills, of Coin, and C. W. Newby, of Englewood.

CHEMAWA, OREGON.—The Chemawa Mutual Telephone Company has incorporated with a capital stock of $1,000. It is the intention of the Chemawa Mutual Company to absorb the interests of the Chemawa-Brooks Mutual Co-operative Telephone Company.

LORETTO, PA.—An Independent telephone company is being organized at Loretto for the purpose of building a line from Bradley Junction to Loretto and Munster, and the following officers have been elected: President, W. A. Sanker; secretary, M. J. Bradley; treasurer, W. J. Hogue. Those in Bradley Junction interested in the enterprise are H. Driskel, W. J. Buck, L. E. Kaylor, M. J. Bradley and others.

BLUEGROVE, TEXAS.—Articles of incorporation have been filed by the Bluegrove Telephone Company. The authorized capital stock of the company is $2,400, and the incorporators are W. H. Lewis, O. A. Blake, J. B. Herd, of Bluegrove.

CRAWFORD, TEXAS.—The Crawford Telegraph and Telephone Company has been incorporated with a capital stock of $6,000. Among the incorporators are J. B. Nicholas, M. Marks, W. D. Sutton and J. W. Gee.

HOUGHTON, ONT., CAN.—An Independent telephone company has been formed by a number of Houghton farmers, and the following officers elected: Jas. Boyd, president; J. Meharg, vice president; Wm. Alwood, J. A. Garham, Chas. McKim, H. Armstrong, C. B. Matthews, H. Maguire and John Hazel, directors. It is the company's intention to construct a line from Frogmore to Straffordsville, via Kinglake and Guysboro.

FRANCHISES.

GALENA, MO.—The Cherokee County Mutual Telephone Company has applied for a franchise at Galena. The company expects also to construct lines from Melrose to Columbus, Hallowell to Sherwin Junction, West Mineral to Columbus, and from Columbus to Weir City. New local exchanges are to be installed at a number of places.

FARGO, N. D.—Application has been made by the North Dakota Independent Telephone Company for permission to operate long distance lines in Fargo, and to construct and operate a number of long distance pay stations.

HUMACAO, PORTO RICO.—A telephone franchise will be granted to Juan Bertran, of Humacao, Porto Rico, for the construction and operation of long distance telephone lines in Yabucoa, Naguabo, Playa de Humacao, Humacao and other places if a bill now under consideration in the United States Senate is passed.

FINANCIAL.

HAMILTON, O.—The sixteenth regular quarterly dividend of one per cent. has been declared by the Hamilton Home Telephone Company.

DELL RAPIDS, S. D.—The Dell Rapids Telephone Company has declared a dividend of six per cent. from the net profits of the year.

WHEELING, W. VA.—It is the intention of the National Telephone Company to declare a four per cent. dividend next month, and thereafter the stock is to be placed on a two per cent. quarterly dividend basis.

EAU CLAIR, WIS.—The Luddington Telephone Company has increased its capital stock from $3,000 to $15,000.

COMBINATIONS.

QUINCY, ILL.—The Quincy Home Telephone Company has purchased the long distance lines running through Ellington township.

KITTANNING, PA.—An arrangement has been perfected by which the Kittanning and Armstrong County Telephone companies have been merged, and the Kittanning Company now has charge of about 110 miles of telephone lines, with exchanges at Leechburg, Avinmore, South Bend, Elderton, Rural Valley, Dayton and Smicksburg. Under the new management the lines will be overhauled and placed in first class condition.

CLIFTON, TENN.—The Consolidated Telephone and Telegraph Company has become the property of the W. C. Cole Telephone Company, the latter being composed of W. C. Cole, of Perryville, and J. U. Speer and L. A. Raines, of Parsons. The principal exchanges of the new company, which is to be known as the Consolidated Telephone and Telegraph Company, are at Savannah, Waynesboro and Clifton. The officers of the new company are W. C. Cole, president; L. A. Raines, vice president; J. U. Speer, secretary and treasurer.

ELECTIONS.

RICHMOND, IND.—The following officers have been elected by the Richmond Home Telephone Company: A. C. Lindemuth, president; Samuel Dickinson, vice president; James W. Moore, secretary; John M. Lontz, treasurer; E. H. Cates, L. M. Flesh, W. P. Orr, A. C. Lindemuth, Samuel Dickinson, James W. Moore and John M. Lontz, directors.

SHERMAN, MICH.—The Wexford County Independent Telephone Company has elected G. A. Lake, president; Carl East, vice president; G. A. Frederick, treasurer; W. E. Southwick, secretary.

STOCKBRIDGE, MICH.—The following officers have been elected by the Rural Telephone Company: President, Thos. Howlett; vice president, O. Jones; secretary, L. Milner; treasurer, H. Singleton; manager, S. J. Proctor.

OAKLAND, MINN.—The officers elected by the Four Corners Telephone Company for the coming year are Henry Holverson, president; H. Brierly, secretary; O. R. Johnson, treasurer; John Wood, manager.

HASTINGS, NEB.—The Hastings Independent Telephone Company

THE WEEK'S MESSAGES

has named as directors for the coming year R. A. Patty, Herman Stein, J. N. Lyman, S. S. Snyder and G. J. Evans.

YORK, NEB.—The following officers have been elected by the York Telephone Company: President, G. H. Holdeman; vice-president, C. N. Beaver; secretary and manager, Edwin Bell; treasurer, H. M. Childs.

BERGEN, N. Y.—The Bergen Telephone Company has elected the following officers: Geo. R. Fuller, president; Geo. Sands, vice president; C. M. Beattie, secretary; C. E. Housel, treasurer.

GALWAY, N. Y.—The Galway Telephone Company has elected the following officers: Mine McWilliams, president; H. R. Crouch, vice-president; F. L. Smith, secretary and treasurer.

PATCHOGUE, L. I., N. Y.—The officers of the Suffolk County Telephone Company are H. C. Losee, president; F. Hammond, vice president; D. Chichester, secretary; J. T. Losee, treasurer.

PENN YAN, N. Y.—The following officers have been elected by the Yates County Independent Telephone Company: President, Charles E. Guile, Penn Yan; vice-president, Frank E. Spencer, Benton; secretary and treasurer, Marvin Spooner, Milo.

DELAWARE, O.—The Board of Directors of the Citizens' Telephone Company comprises C. D. Young, W. G. Hormell, W. Guy Jones, J. O. Gooding, W. M. Heseltine, J. L. Anderson, W. B. Hedges, A. J. Pounds, G. H. Carter.

MAHANOY, PA.—The Mahanoy & Mahantongo Telephone Company has elected the following directors: E. W. Dockey, W. P. Zartman, W. C. Leitzel and Herbert Cummings.

VANVOORIS, W. VA.—At the annual meeting of the Farmers' Telephone Company the following officers and directors were elected: A. M. Sterling, president; S. Morris, vice president; E. J. Moore, treasurer and general manager; W. A. Brown, secretary; directors, A. M. Sterling, Springer Morris, Imri Hunt, E. J. Moore, A. S. Mapel, F. B. St. Clair and W. A. Brown.

RHINELANDER, WIS.—The Rhinelander Mutual Telephone Company has elected Arthur Taylor, president; M. H. Raymond, treasurer; John Hanson, secretary; A. Taylor, D. J. Cole, D. F. Recker, E. A. Forbes, E. O. Brown, directors.

MISCELLANEOUS.

OMAHA, NEB.—The Independent Telephone Company has deposited with the city treasurer the $25,000 required as a forfeit under the franchise voted it last fall, and construction work will be carried on as rapidly as possible.

EAU CLAIRE, WIS.—The Chippewa County, Osseo, Bloomer and Ludington telephone companies and the Augusta and Caddot systems are to form a connection.

PORT LAVACA, TEXAS.—The Port Lavaca telephone system has been acquired by W. C. Best, the purchase price being $7,000. It is the new owner's intention to greatly improve the plant.

SHERMAN, TEXAS.—The Phoenix Telephone Company, which operated a line between Sherman and Honey Grove, has become the property of H. D. Keith and others. It is the intention of the new owners to build additional lines, making a through circuit from Texarkana to Fort Worth and Dallas.

ASOTIN, WASH.—The Asotin Telephone Company has been purchased from F. B. Simpson by N. J. Cunningham, of Clarkston.

BURGESSVILLE, ONT., CAN.—The Burgessvile Telephone Company, Ltd., in its annual report shows very satisfactory progress for the year just ended. This company now has about fifty miles of pole lines, with seventy miles of wire, and about one hundred and sixty-five telephones are connected to the two exchanges which it operates. Extensions of considerable importance are to be made in the near future in order to meet rapidly increasing demands for service.

PERSONAL.

G. W. COLTON has been appointed to take charge of the exchange of the Lackawanna Telephone Company at Scranton, Pa.

HENRY H. SYKES has recently been appointed to the position of general manager of the Southern New England Telephone Company at New Haven, Conn.

C. W. YOUNG has been appointed manager of the Council Grove Telephone Company's exchange at Council Grove, Kan.

New Construction in the Field

LOS ANGELES, CAL.—The Home Telephone & Telegraph Company expects to increase the capacity of its plant to sixty thousand telephones, and construction work will be pushed as rapidly as possible.

BELVIDERE, ILL.—The Belvidere Telephone Company is at work installing its new system.

HOLLAND, IND.—A new line is being constructed from Holland to Selvin by the Holland Telephone Company.

INDIANAPOLIS, IND.—Many improvements are being made in the plant of the Indianapolis Telephone Company.

SIOUX CITY, IA.—The Sioux City Telephone Company contemplates the expenditure of over $75,000 in improvements during the coming year. These will include several miles of new cable, and pole line extensions in the northeast part of the city.

WAUKON, IA.—The exchange of the Standard Telephone Company is to be entirely rebuilt.

DENISON, KAN.—Among the improvements planned by the Denison Telephone Company is the installation of a new switchboard.

MOHAWK, MICH.—A telephone system from Mohawk to Mandan has been installed by the Keweenaw Central Railroad Company, and wires are also to be strung to Calumet.

YPSILANTI, MICH.—It is the intention of the Washtenaw Home Telephone Company to spend $200,000 in improving its system in and about Ypsilanti.

DULUTH, MINN.—Many new lines are to be built by the Peoples' Telephone Company.

LITTLE FALLS, MINN.—Many new lines are to be erected by the Darling Telephone Company.

BOWLING GREEN, MO.—Among the improvements planned by the Pike County Telephone Company is the installation of a new switchboard.

STERLING, NEB.—An entirely new system is to be installed by the Independent Telephone Company at Sterling.

NUNDA, N. Y.—It is the intention of the Nunda Telephone Company to install a new switchboard.

FULTON, N. Y.—It is the intention of the Oswego County Independent Telephone Company to expend about $75,000 on its Fulton exchange, and about $200,000 on the Oswego exchange. The company has recently obtained a franchise in Phœnix, where its lines will connect with the Syracuse Independent Telephone Company for long distance service.

LORAIN, O.—Plans for the improvement of its system by the Black River Telephone Company include the construction of a toll line from Lorain to Elyria, and the addition of four hundred and fifty lines to its switchboard.

MAHANOY, PA.—The lines of the Mahanoy & Mahantongo Telephone Company are to be extended to a number of towns in Northumberland and Schuylkill Counties.

HECLA, S. D.—The Dakota Central Telephone Company contemplates the construction of a line through the country west of the Missouri River, and from Frederick to Hecla.

MILBANK, S. D.—Additional lines are to be built by the Farmers' Telephone Company from Wilmot to Sisseton.

WENTWORTH, S. D.—Many improvements and extensions are to be made by the Battle Creek Telephone Company in its system.

WHITE LAKE, S. D.—The Crystal Lake Telephone Company expects to build new lines.

BRISTOL, TENN.—Many extensions are being made in the lines of the Bristol Telephone Company.

MART, TEXAS.—The Mart Telephone Company, of Mart, Texas, will erect a brick building and install a large amount of cable. It has placed an order for a full multiple central energy switchboard.

MILTON JUNCTION, WIS.—Much new construction work is planned by the Milton Junction Telephone Company.

SHEBOYGAN, WIS.—It is the intention of the Citizens Telephone Company to install a new switchboard and otherwise improve its system.

UNDERGROUND.

SAN DIEGO, CAL.—Some of the wires of the Home Telephone Company are being placed underground in San Diego.

SAN FRANCISCO, CAL.—About $30,000 is being spent by the Home Telephone Company in underground work in this city.

BOISE, IDAHO.—It is the intention of the Independent Long Distance Telephone Company to install underground plants at Nampa and Nyssa, Ore., franchises having been secured at these places.

HENRY, ILL.—An underground system is to be installed by the Henry Telephone Company.

LEAVENWORTH, KAS.—Considerable conduit work is being done by the People's Home Telephone Company at Leavenworth.

SCHENECTADY, N. Y.—A great many of the Home Telephone Company's wires are being placed in conduits.

GREENSBURG, PA.—All telephone wires are to be placed underground in Greensburg.

The Gould Plate is Not Built-Up

The contact surface and grid are absolutely continuous metal. A sheet lead "blank" is passed between two sets of thin steel discs which "spin" the metal into numerous ribs. The illustration shows a fragment of a Gould plate—shows the ribs, the central web and conducting cross bars that equalize the current flow, to and from all points of the plate. This is one very important factor in long life.

JUST A SUGGESTION

Take one of your busy 4-party lines and equip it with "POOLE" Lock-Outs. Leave it in service a month and then see how many of the four will stand a raise of $3.00 a year rather than go back to the old way. We know the answer, but we want your subscribers to impress on you the fact that the "POOLE" Lock-Out is a rate-raiser.

It won't cost you anything to try it, because we will loan you the Lock-Outs free and there is no other equipment required. Write today for our Booklet AL-2.

Mountain State Electrical Company

DEAN TELEPHONE APPARATUS

Express Type Switchboard Operator's Sets

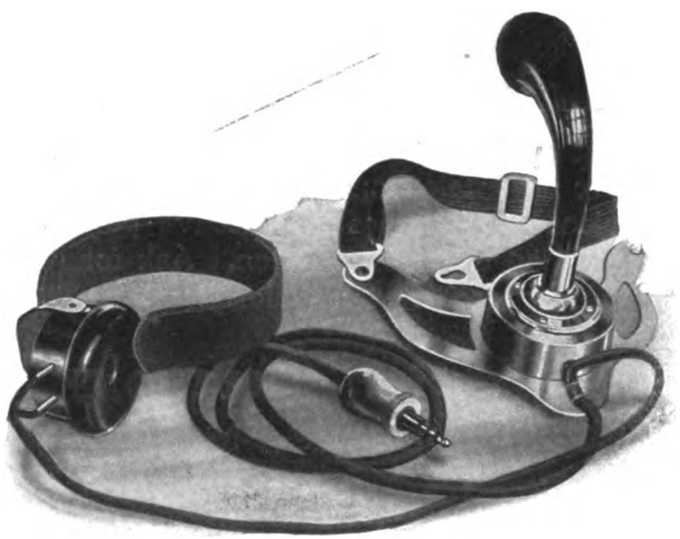

Fig. 1.

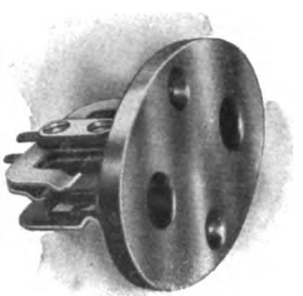

Fig. 2.

We are prepared to furnish our new breast-plate transmitter operator's set on our Express Type Switchboard instead of the regular suspended type transmitter, when so desired.

This new operator's outfit, shown in Fig. 1, consists of an all-aluminum frame transmitter, head receiver, silk covered connecting cords and a new design of four conductor connecting plug. The latter is made to eliminate the usual troubles of loose cord connections and undue breakage of the cord where it enters the plug.

The transmitter is extremely light in weight, powerful in action and made to stand rough usage. The working parts are interchangeable with those of the standard Dean transmitter, thus insuring the best possible results.

The cut-in jack, Fig. 2, used with this outfit, is of the twin type, the extra jack being provided for emergency use or for connecting a learning operator's set. The removal of the plug from the jack opens the transmitter circuit, so as to prevent waste of current when the operator leaves the switchboard.

The use of the breast-plate transmitter forces the operator to always talk directly into the instrument regardless of her movements, and gives her the free use of both hands for operating. Her *labors* are thereby made *lighter* and the *service* made *better.*

Our *magneto express type switchboards* have many other devices for bettering the service and simplifying the work of the operator and the switchboard man.

Let us figure on your next switchboard and telephone equipment. Our prices are right.

Stromberg-Carlson Telephone Mfg. Company

Rochester, N. Y. February 23, 1907.

TO THE EXCHANGE MANAGER AND TELEPHONE USER:

Would you be willing to be convinced that by using "STROMBERG-CARLSON" Switchboard and Telephone Cords, the maintenance cost of your switchboards and telephones can be considerably reduced, and most cord trouble, if not all, eliminated?

Our cord and insulating department covers an area of 18,000 square feet, about one third of an acre. The most modern equipment is employed, consisting of 137 double and triple deck braiding machines, and 94 - 14 spindle insulating machines. Fifty finishers on cords occupy several specially equipped tables, arranged in a well lighted and ventilated work room.

Every "STROMBERG-CARLSON" Cord is inspected and given a break-down test before passed for final inspection. Imperfect cords are not shipped.

Subsequent letters will explain the designs, we will add nothing except to tell you that about three weeks ago we established NEW PRICES.

We offer you an opportunity to examine our samples and prices to-day!

Do not wait until to-morrow!

Yours very truly,

Stromberg-Carlson Tel. Mfg. Co.

TOLL LINE SIGNAL

This signal is made up of standard ringer coils and a regular jack. The striker rod of the ringer has a projection beyond the striker ball which engages the drop. The mounting plate is just twice as large as the plate for five Monarch drops and jacks, so two ringers, drops and jacks occupy the space of ten drops and jacks. Our catalogue describes this toll line signal.

GRAND PRIZE, MILAN, ITALY, . . 1906

The telephone shown here contains our No. 22 4-Bar Hand Generator, No. 1-A 1000 Ohm Ringer, No. 1-A Induction Coil, No. 65 Hook Switch, No. 22 Transmitter, No. 20 Transmitter Arm, No. 18-A Receiver, No. 3 Lightning Arrester, 2 Columbia Dry Cells and Oak Woodwork.

In the following numbers of this Journal we will describe each part of apparatus listed above used in these telephones. This type of instrument is rapidly coming into general use. Ours give universal satisfaction. A thorough investigation will justify all the claims we make of our supremacy in the manufacture of telephone apparatus.

Let our Department A furnish you with our Bulletins and prices on Magneto Apparatus. We solicit your correspondence.

Sioux Falls

South Dakota Branch

300-302-304 NORTH PHILLIPS AVENUE

On and after February 1st we will make shipments from above named point. We will carry in stock a complete line of Telephones and Tele-phone Line Material, Wire Insulators, Cross Arms, Brackets, etc., etc., and all orders will be shipped same day they are received, insuring quick delivery and a con-siderable saving in freight charges. The establishment of this branch, together with our branch at Kansas City, Mo., places us in a better position to care for your wants than any other concern. We are now shipping two car-loads of telephones and supplies per week from Kansas City branch, will soon be shipping that amount or more from Sioux Falls branch. The Reason: prompt deliv-ery, correct prices and a product that is abso-lutely unequaled.

It will prove interesting to you if you will allow us to submit our 1907 proposition.

You Wouldn't Start a Horse Car Line

in this age of electric cars? Not if you wanted to make money out of the business of transportation.

Then why should you start a manual telephone exchange in this age of automatics, if you want to make money out of the telephone business?

The automatic system of telephony bears the same relation to the manual system that the electric car does to the horse car. It is the apotheosis of telephone development, as the electric car is of transportation development.

The automatic telephone system produces the best service more economically than indifferent service can be produced with manual equipment.

There is no more question as to the relative popularity of the automatic and manual telephone service where the two kinds are in competition than there is as to the relative popularity of the trolley car and the horse car.

And, as for the securities—the same comparison may be applied with the same results.

Our Automatic system has been adopted in the following cities:

Aberdeen, S. D.	Clayton, Mo.	Jonesboro, Ark.	Ocean Park, Cal.	Springfield, Mo.
Akron, Ohio.	Cleburne, Texas.	Lake Benton, Minn.	Pentwater, Mich.	St. Marys, Ohio.

Convention of the Kansas Independent Telephone Association

THE sixth annual convention of the Kansas Independent Telephone Association, held at Topeka on February 5th and 6th, was a complete success from every point of view, In the first place there were 150 delegates present, representing almost the entire Independent telephone interest of the State; and in the second there was an enthusiasm noticeable which has never in the past been equalled at a meeting of the Association.

Every portion of the State was represented either by a delegate from the company covering that section or by an authorized delegate to whom was entrusted the duty of protecting the interests of the Independent telephone company issuing him the proxy. While Topeka is probably as nearly the center of the Independent telephone interests of the State as any other city, delegates traveled in mileage what in some instances would have amounted to several times the breadth of Eastern States in order that they might be present at the meeting.

Delegates to the Kansas Convention, Assembled in one of the Rooms of the New Independent Exchange Building at Topeka.

When the Bell people controlled the telephone situation in this country, Kansas and the tributary territory was one of their richest fields, and, as a consequence, the fight made against them by the Independent companies was necessarily of the most strenuous character. Every wile and tactic known to the old monopoly was brought to bear to break down the new companies which, mushroom-like, sprang up seemingly in a day.

These fights seemed to strengthen rather than weaken the Independent companies, and they are to-day stronger than ever before in their existence. At first the weaker exchanges were either bought up or compelled to cease their existence for lack of funds, but these tactics have availed the older company but little, and in spite of this fight the Independents have grown stronger every month.

The convention met in the handsome new quarters now almost completed for the use of the Independent Telephone Company of Topeka, at a cost of $35,000 for the building alone. The equipment will cost more than double that sum. The holding of the meeting in such a place was without doubt an inspiration to the delegates representing the smaller companies in the State who in the past have had a hard-fought battle against the telephone trust. While incomplete as to details, the building is one of the finest used exclusively for telephone purposes to be found anywhere in the country.

The business of the meeting was in a great measure of a routine nature, aside from the reading of a number of interesting papers by the members of the association. A delegate was selected whose duty it shall be to represent the association before the meeting of the State legislature, which is in session at this time. The executive committee of the association was also empowered to appoint a field agent whose duties are to be to care for the general interests of the members of the Independent Telephone Companies of the State.

The meeting was called to order by its President, W. H. Nelson, of Smith Center; F. M. Pearl, the secretary of the association, being absent, W. P. Hemphill, of Topeka, was made temporary secretary. The president, in calling the convention to order, called attention to the continued growth in the number of exchanges and a corresponding increase in the number of telephones in use, which has been maintained during the past year. This has been accomplished by the expenditure of vast sums of money, making this industry probably second in importance only to the great railroad interests of the State. This immense system is practically owned by the citizens of Kansas, and not controlled by any outside interests. President Nelson forcibly recommended the employment by the association of a competent, reliable man to look after the common interests of the members carefully and impartially. He called attention to the fact that all the State organizations which have been exceptionally successful have adopted this plan and are well satisfied with it.

Another important recommendation was that there should be provisions made for regular meetings of the executive committee at least quarterly, and their actual expenses paid while attending these meetings. Upon these gentlemen depends the actual business of the association, and they should not be compelled to give their time and pay their own expenses without remuneration. Attention was also called to the benefits which come to the State organization through its membership in the national association.

Digitized by Google

In closing his address the president dwelt upon the services which the executive committee have rendered the association during the past year, and expressed the gratitude of the members for their earnest work, which has been so carefully and unselfishly carried on. After the conclusion of the president's address Mr. Dolan of Clifton moved that two committees of three members be appointed by the chair, one a committee on resolutions, the other a committtee on auditing. The motion was carried and the committees appointed as follows: Resolutions, J. M. Doyle, Chas. Henderson and A. T. Rogers; Auditing, C. L. Brown, H. G. Miller and J. S. Zimmerman.

After the appointment of these committees the president called on the several vice presidents who had been appointed at the last annual meeting held at Wichita to state the conditions of the telephone business in other territories, the progress which had been made in the way of the developments and the situation relative to the movements of the opposition. Good reports were received from many quarters.

Mr. Doyle, of Belleville, was appointed to represent the association before the Legislative Committees of the Senate and House of Representatives with reference to legislation pending affecting telephone interests.

After a thorough discussion, in which C. L. Brown, of Abilene; J. M. Doyle, of Belleville; C. J. Myers, of Kansas City, and others took an active part, the Executive Committee of the association was instructed to choose and employ some suitable person to be known as the traveling secretary, whose business it shall be to look after the various interests of the members of the Independent Telephone Association and to work under the direction of the Executive Committee. The Executive Committee was also empowered to fix the salary of the traveling secretary and to levy assessments against the members of the association to raise funds for the payment of this salary and all necessary expenses of the secretary.

W. P. Hemphill.

At the suggestion of B. F. Pankey, of Topeka, the convention extended an invitation to Senator Noftzger to appear before the convention and explain the purposes of telephone legislation of which he was the author.

So far there has been no legislation hostile to the Independent companies of the State introduced in the legislature with the single exception of a bill by Senator Noftzger. This bill is for the physical connection of competing telephone systems, similar to those which have been introduced in the legislatures of Texas, Missouri, Nebraska, Iowa and elsewhere, almost simultaneously and apparently originating from the same source, though this is denied by the author of the bill introduced by the Kansas senator.

Senator Noftzger appeared at the second meeting of the association and disclaimed all intention of injuring the Independent companies of the State and explained his reason for introducing the bill by a story not unlike one which could be told by any person who has been compelled to use a telephone line in a sparsely settled section of the State such as he represents.

He said: "I have attempted to communicate with towns adjacent to the one in which I live and in which there are no Independent lines and have been compelled to use the Bell line, which is the one controlling the business in the town of Anthony, where I reside. I have asked the Bell company to connect me with the people with whom I wished to converse, who in several instances happened to be patrons of the rival line, only to be told that such action was against the rules of their company.

"This may be right, but to me it seems to be a great wrong, and for this reason I introduced the bill, which, if it becomes a law, will compel exchanges to connect their patrons with those of rival lines. I have asked that telephone lines be declared common carriers and as such they will come under the supervision of the Board of Railroad Commissioners of the State and subject to such rules as they may make.

"I would not cripple the interests of the Independent companies in the State and when I introduced this bill I thought that they would be the gainers from my action if the bill should become a law."

After the injustice of such a law was made apparent to the senator he stated that he would so amend it that the bill will apply only to long distance connections, and it is even hoped that upon further representations the disadvantages of the bill may be made so evident to the legislature that it will be completely dropped.

While it is intimated that every effort will be made to introduce legislation hostile to the Independent companies in the State by a lobby which does not represent its interests, there is little hope from the opposition standpoint that such legislation will be enacted into laws. In Kansas the Independent companies, protected by just laws, have grown until to-day they are far more important than the Bell interests.

When Mr. Doyle, chairman of the Resolution Committee, made his report he presented a statement conveying to the officers of the past year the hearty thanks of the members for their work in behalf of the Independent telephone business of the State. Another resolution was as follows:

"*Resolved*, That we extend to the Topeka Independent Telephone Company our thanks for their efforts in making our meeting here pleasant and profitable, and offer our best wishes for its abundant success."

Thanks were extended to the city press for the fine and impartial manner in which they reported the proceedings.

These resolutions were all unanimously adopted as fitting expressions of the general sentiment of the convention. In an intermission in the routine business of the association Miss Ethel Pankey, of Topeka, read a paper entitled "The Importance of Good Operators" which covered the subject in an exceptionally thorough and interesting way.

The following applications for membership were received, together with the membership fee, and upon motion were accepted; Allen Telephone Company, Nortonville Telephone Company, Enterprise Telephone Company, Perry Telephone Company.

The election of officers for the ensuing year was taken up and Mr. Doyle, of Belleville, moved that the present president, Mr. W. H. Nelson, be re-elected. Mr. Doyle put the motion to the convention and it was carried unanimously. W. P. Hemphill, secretary and treasurer of the Topeka Independent Telephone Company, of Topeka, Kan., was elected secretary, and C. L. Brown, of the Brown Telephone Company, Abilene, treasurer.

The president appointed the following Executive Committee for the ensuing year: A. T. Rodgers, Beloit; J. E. Byers, Ottawa; C. C. Van Deventer, Kingman; C. E. Betts, Atchison, and J. M. Doyle, Belleville.

The appreciation of Topeka as a gathering place for the members and of the courtesies received from the company which operates there, was indicated by the passing of a motion expressing the opinion of the members that the officers should select Topeka for the next convention.

Topeka, the capital, is also practically the telephone centre of the State. The Independent company there, although but sixty months old, boasts of 6,000 telephones with toll lines connecting it with exchanges in all parts of the State as well as with all Independent lines in adjacent States. It was claimed at one time that an attempt was being made by the Bell company to buy up the toll lines of the new companies and purchases made at the time justified the prediction. Whether this was true or not the attempt was a flat failure and the Independent companies are stronger to-day than at any time in their existence.

The Independent company in Topeka, which is easily double the size of any other in the State, with its 6,000 subscribers, reports connections with many exchanges in Kansas and adjacent

Digitized by Google

territory, new ones being added almost daily. The company has a full cable system with more than 250,000 feet of conduit already laid. It has not yet quite completed its new office building, in which the convention was held. This will be ready in about one month. The opening of this new plant is of great importance to all telephone users in the State. Of all the telephone exchanges in Kansas, it is said that 600, or more than 95 per cent., belong to Independent companies and new Independent exchanges are being installed as the growth of towns in the State will justify them. Practically all existing companies are growing rapidly. The Independent companies are just entering their era of prosperity and the end is not in sight.

Racking for Underground Cables in Central Offices

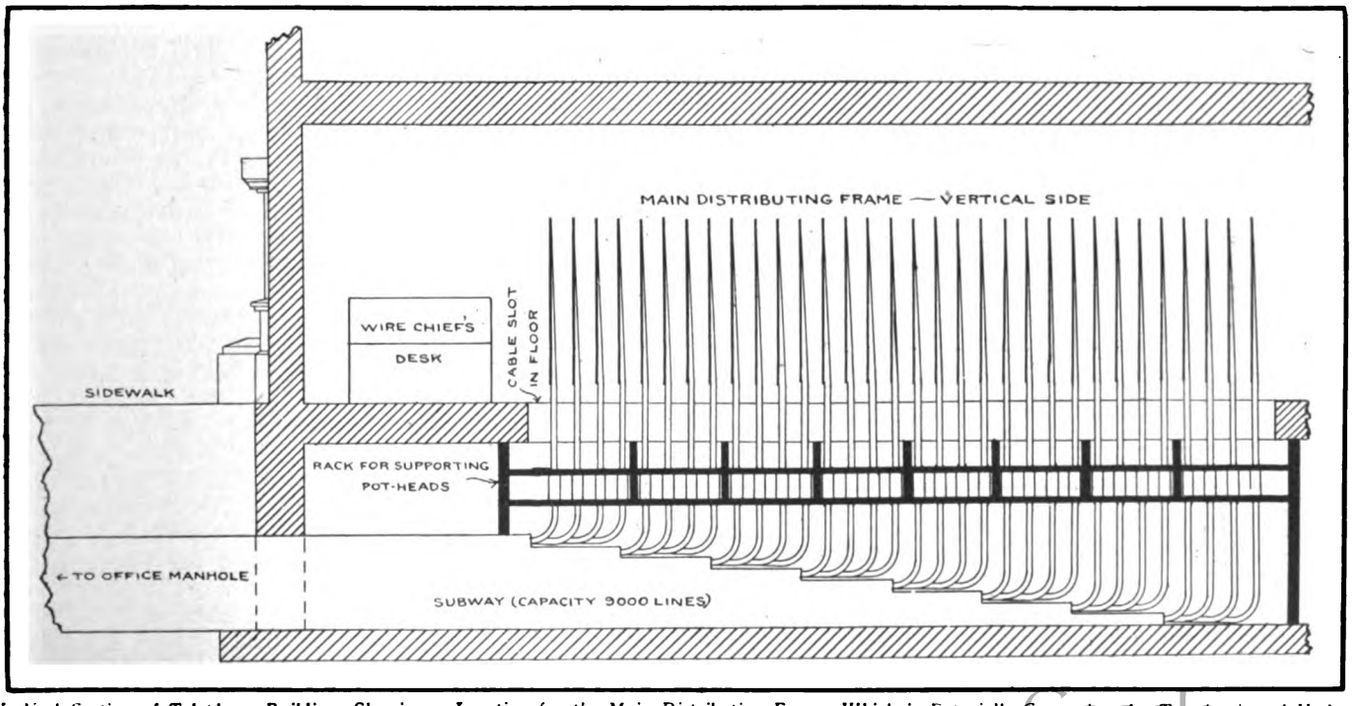
By Lewis F. Post.

MANY items must be taken into consideration when the apparatus in a new exchange is to be laid out. All depend more or less upon the kind of circuits to be used and the amount of available floor space. For some inexplicable reason engineers are very much inclined to give all portions of the plant precedence over the underground cable entrance. Usually they locate the main distributing frame in an out-of-the-way place so that it becomes extremely difficult for the underground cables to be carried to it without making long runs with many twists and bends.

Where long runs must be made in order to reach the main frame, specially constructed cable racks have to be designed to hold the cables. These racks must of necessity be spread out considerably so that access can be had from all sides to facilitate the work of pulling in and splicing up. This means that the rack takes up much valuable space in a large exchange that could probably be utilized to better advantage for some other purpose. Switchboard cables take up less room than lead-covered cables and can be suspended from the ceiling in small racks without taking up any floor space. On the contrary, underground cables cannot readily be laid side by side and suspended from the ceiling, owing to the difficulty that would be met with in installing and maintaining them. For these reasons, if not opposed by more urgent considerations it is likely to be advisable in a large exchange to place the main frame as near to the point of entrance as possible, even if the switchboard cables have to be extended a few feet more to accomplish the purpose.

A certain exchange in Philadelphia offers a fair sample of what happens when no provisions are made to properly support the underground cables. Here cables were supported on racks hung from the ceiling in the basement. The scheme worked well enough for the first few cables, but as the plant grew the bunch kept getting larger and larger until finally the first cables pulled in became so interwoven with the others that to-day practically every individual cable in the mass is inaccessible. This bunch of cables is largely made up of 300 pair units and it would be a very tedious and expensive piece of work to attempt to straighten them out. In this particular exchange, however, the main frame is close enough to the point of entrance; the mistake lies in the manner in which the cables were run from the subway and to an extent in the construction of the subway itself. Instead of entering on a level with the floor of the basement it enters only a little below the ceiling. If the main frame could be in every case located close to the point of entrance there would undoubtedly be a saving, due to the simplification of the work of the underground cable force. In many cases this saving would have so little expense in other directions to counterbalance it that it would undoubtedly be economical, and such an arrangement should always be at least considered.

A nearly ideal arrangement is shown in the drawing. The subway extends into a vault in the basement directly under the main frame. Each tier comprising four ducts terminates at a point sufficiently far from the portion of the main distributing frame to which it is to be connected to permit of turning the cables on an 18-inch radius and then running them straight up into their respective places in the main frame. Such an arrangement assumes that the cables are all of 300 pairs, and that there is a like number of lugs on the vertical strips of the frame. Each cable terminates in a pot-head which is fastened securely by clamps to a specially constructed rack. From the pot head rubber-covered wires are made into a form which is run up into the frame. The rack is fastened to the I-beams in the ceiling and is constructed of angle and channel steel. No splicing outside of that which is done on the pot heads is permitted in the vault.



Vertical Section of Telephone Building, Showing a Location for the Main Distributing Frame Which is Especially Convenient for Termination of Underground Cables. Arrangement of Cable Ducts and Racking for Potheads is Indicated Below the Distributing Frame.

All cable throws and splices are made in the manhole, which is designed especially for the purpose, being located directly opposite the exchange.

WISCONSIN TELEPHONE MEN FORM DISTRICT ORGANIZATION.

RICHARD VALENTINE was made temporary chairman, and Alfred Slater, of Beloit, was made temporary secretary at a meeting of thirty-five representatives of Independent telephone companies of the first congressional district of Wisconsin, who met at Janesville to form an association to cooperate with the state organization, and take such steps as will assist in more perfectly unifying the Independent systems of the State.

After consideration of various matters before the association, the following officers were elected: President, H. A. Moelenpah, Clinton; secretary and treasurer, F. C. Grant, Janesville. Among the delegates present at the meeting were C. H. Wisnell, L. R. Whitman and W. B. Eles, of Elkhorn; John C. Morchek, of Brodhead; C. B. Frenning, of Monroe; Alfred Slater, of Beloit; E. T. Cass and A. J. Warner, of Whitewater; O. L. Woodward and H. H. McCullough, of Clinton; A. L. Moore, of Brodhead; W. H. Pellington, of Sharon, and Clarence Jordalen, of Stoughton.

Principles of the Telephone*

By Arthur Bessey Smith, Department Telephone Engineering, Purdue University.

IN the past few years there has been a great advance in the simplification of the subscriber's instrument. In the local battery telephone as above described there are two complete power plants, each subject to its own troubles. If some means could be devised to remove these power plants from the instrument leaving only enough apparatus to control the power which may be supplied from the central office, it would greatly reduce the cost of operation and the inconvenience to users from troubles. This has been done in the modern common battery system, sometimes known as central energy. The plan of feeding battery current for talking purposes is shown in Fig. 5. This is the Hayes system, used by the Bell companies. The battery, *B*, consists of eleven cells of storage battery, giving from 22 to 24 volts. R_1 R_2 R_3 and R_4 are four separate windings which are on the same iron core. Through R_1 and R_2 current is fed to the telephone at the left, which is typified by a transmitter and a receiver in series. If words are spoken into the transmitter of the left hand telephone, its resistance will change so as to cause the current to undulate. This undulating current flowing through R_1 and R_2 will generate an alternating current in R_3 and R_4 which will flow over the line to the right hand telephone and reproduce itself in the receiver in the form of sound. The key to the whole action lies in the transformer-like performance of the coils, and for this purpose they are of necessity wound on the same core as stated. The term "repeating coil" has aptly been applied to this coil as the current is repeated from one circuit into the other by its means.

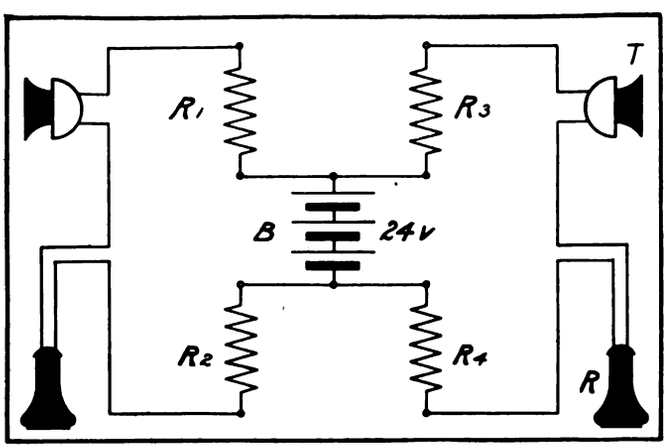

Fig. 5. Simplified arrangement of two telephones connected through common battery cord circuit.

The system of battery feed used by Independent telephone companies is known as retardation coil feed, and is shown in Fig. 6. The same kind of battery is used, but instead of four coils on the same core, there are employed four separate cores, each with its own winding They are connected in much the same manner as the Hayes system, R_1 and R_2 feeding battery to the left telephone and R_3 and R_4 to the right. Connected between the outside terminals of R_1 and R_3 is a condenser, *C*, which is made of alternate layers of rice paper and tinfoil. Another condenser is connected between the similar points of R_2 and R_4. If one of the transmitters is disturbed, its changes of resistance will cause the current to undulate, but owing to the high self-induction of the four coils, the alternating part of the current will take the easier path through the condensers to the telephone at the far end of the line. There is practically no leakage of talking current through the retardation coils. Two types of telephones are shown here, both of which are quite widely in use. On the right is the type which employs merely an induction coil, whose primary is in series with the transmitter. The secondary is connected with the receiver in a local circuit. For several reasons it is best to keep the battery current out of the receiver, and this use of the induction coil is one of the ways of accomplishing it. At the left of the figure is another way of doing it. In series with the transmitter is a retardation coil. Shunted around the coil are the receiver and a condenser in series with each other. The condenser keeps the battery current out of the receiver, while allowing the high frequency voice currents to pass with readiness.

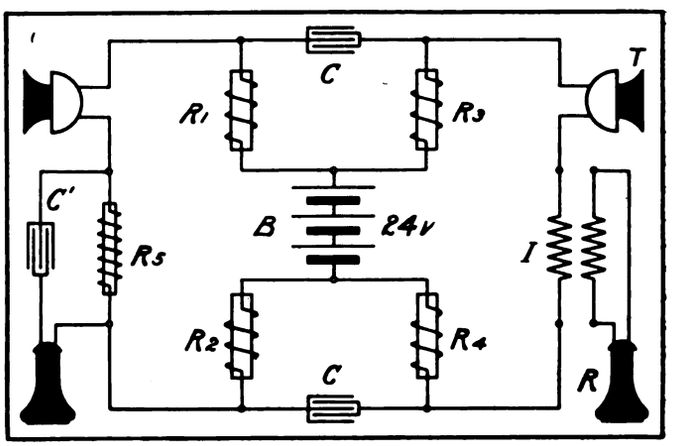

Fig. 6. Simplified circuit for distributing battery current to telephone instruments through retardation coils.

One of the most ingenious schemes for keeping the battery current out of the receiver while still allowing the talking current to pass has been brought out by Mr. William W. Dean. He has adapted the principles of the Wheatstone bridge, as shown in Fig. 7. *A*, *B*, *C* and *D* are four coils, *R* is the receiver, *T* the transmitter, and L_1 and L_2 are the line binding posts to which are connected the wires coming from the central office, and which supply battery current to the instrument.

Let us suppose that the battery current comes in at L_1, divides at 1, part flowing through *A* and *C*, part through *B* and *D*, reuniting at 2 and returning through the transmitter, *T*, to the

*Abstract from a paper read before the Indiana Engineering Society, Jan. 19, 1907, continued from the issue of Feb. 16th.

Digitized by Google

other binding post, L_2. The four resistances have a proportional relation so that $A:B=C:D$. Under this condition the points 3 and 4 will have the same potential and no battery current will

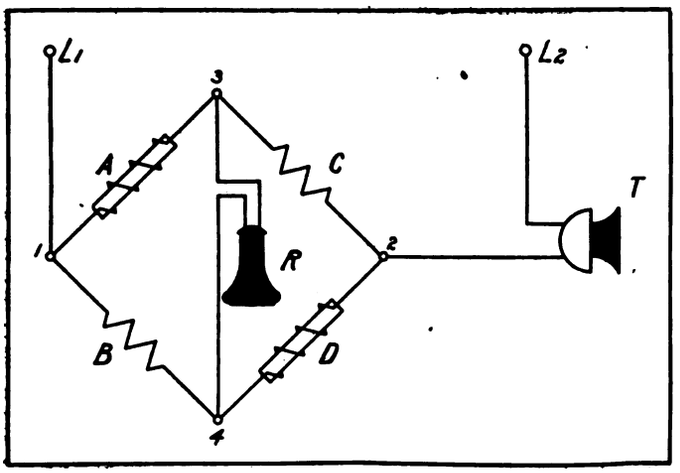

Fig. 7. The "Wheatstone bridge" talking circuit for a common battery telephone.

flow through the receiver, since it occupies the same relation to the resistances that the galvanometer does in a testing set. If the four coils were equally non-inductive, as would be the case if they were made of German silver and wound back upon themselves, the alternating voice currents would divide also, and the receiver would not get any sound. But the coils A and D are made of copper wire wound inductively on an iron core, so that they will have a very great tendency to choke out or impede the passage of high frequency current, thus forcing it to go through the receiver. Thus we have a telephone set in which the battery current is kept out of the receiver, yet the voice current finds ready access, and this is accomplished solely through the ingenious arrangement of properly proportion resistances and inductances, without the customary condenser.

One of the good points in this instrument is the ease with which trouble is located. A further point is that in case of a failure of the receiver circuit, from either a break in the wire or the short circuiting of the receiver, the subscriber can still talk to central, although not hearing, and the trouble be thus reported.

ILLINOIS INDEPENDENT TELEPHONE MEN MEET AT SPRINGFIELD.

DELEGATES to the annual meeting of the seventh district of the Illinois Independent Telephone Association recently met at Springfield. Telephone men from fourteen counties of the State, representing fifty companies, were present. C. B. Cheadle, of Joliet, secretary of the State Association, and W. H. Bassett, of St. Louis, assistant general manager of the Kinloch Long Distance Company, were present and addressed the members. The sessions which were held were devoted to general discussions of matters connected with improvement of service, construction and operation, and reports of the progress made by the different companies. When the election was held the approval of the work of the officers who had served during the past year was indicated by their re-election as follows: President, W. H. Ramsey, Auburn; secretary and treasurer, F. W. Kelly, Springfield.

WHAT NUMBER?

MIKE DOYLE had charge of a number of horses for a large Cleveland establishment, and, although he had no assistants, he styled himself as Barn Boss.

One morning a few months ago, he suddenly discovered that his stock of feed was pretty low, and hurrying to the telephone he called up the Cleveland Milling Company.

"Hello, Miss, Main 433, if you please, Mam."

"Is this the Cleveland Milling Company?" was the next query.

"Yes," said the voice at the other end of the line.

"Take this ardor, sir," continued Mike.

"All right; go ahead," said the man.

"Twinty bushel oats. Have you got that? Five bushel ear corn, five bales of straw, and a half a ton of hay. I don't want any of that loose hay that blows all over the yard; sind me that pounded up in bundles like a shredded wheat biscuit, ye know. And, see here, me good man, sind that ardor down right away. I haven't a sup in the place for the horses whin they come in this evenin'."

"I'll attend to that," answered the man.

"All right, sir, goodbye," replied Mike, getting ready to hang up the receiver.

"Hold on, hold on!" shouted the man at the other end of the wire. "You haven't told me who this is for."

"It's for the harses, ye bloody fool," responded Mike; "did ye think I was going to eat it meself?"

The Telephone Operator

An Agent of the Public Service who Hourly Receives Hundreds of Orders, Makes the Goods, and Delivers them Instantaneously.—The Girl and the Job.

By Miss E. Keech.

IN these days of modern conveniences, when one wants to do or say a thing in a hurry, his first impulse is toward the telephone. Quickly he picks up the receiver, gives a number, is answered, and in a twinkling the message is delivered. This is done with so little effort on his part that one hardly ever considers how much of his happiness depends upon the operator at the other end of the line—waiting, watching, listening—ever on the alert! How easy it is to straighten out a hundred difficulties every day with the help of the telephone. That lost package is located; Jane must consult Harry about "to-night"; deliveries are hastened; orders given butchers, bakers, florists and grocerymen, social affairs are arranged, firms located, telegrams sent, and even the time of day ascertained. Indeed, the telephone girl takes the place of all sorts of special "Bureaus of Information," with the advantage that questions are answered at once.

Now the average person who has never seen a large telephone exchange is apt to think of it as a place of turmoil and excitement, on the order of a stock exchange, with a babel of loud voices, mobs of people rushing to and fro, and a general atmosphere of wild excitement. On his first visit he is surprised at the air of serenity and calmness pervading the room. There is no visible rush, no excitement, no pell-mell moving about, only the constant hum of low voices and the incessant weaving in and out of the connecting cords. It is only by this order and discipline that the vast amount of business is handled every day. Still it soon becomes evident that, orderly as may be the manner of doing the work, the work itself is, in a large exchange, not of a sort which can be well done by a careless or unintelligent person. The operators sitting at the switchboard have before them several keys—red, black, and shiny steel—each kind of key meaning something different. Above the table are hundreds of tiny holes, for all the world like a huge honeycomb; each hole, or jack, means a subscriber, if open and unmarked, but when not open it may mean any one of a dozen things—as if it contains a white plug it signifies the number has been changed; a black plug means discontinued service, a red plug service temporarily discontinued, and so on. As the observer takes in all this detail, he sees first in one place and then in another the tiny lights

Digitized by Google

flare up, burn for an instant, and then go out. All this seems but a by-play, going on gaily as the operators say "Number, please" and connect the jacks all over the front of the board, each operator a modern Penelope, patiently weaving threads of conversation in and out.

Every morning the operators assemble in the various exchanges and go quietly to their work. There are short girls, tall girls, thin girls, and fat girls; dark girls, blonde girls, and red-headed girls; girls with bows, girls with curls, and girls with pompadours; big girls, little girls, and all sorts of girls. Now, care must be used in the selection of these operators, for the telephone operator, like the poet, is born and not made. There are a few general requirements necessary, or she can never fill the bill. She must be quick of comprehension, have an active mind, and be able to talk. However, being girls, few have any difficulty on the latter score. If a girl has the nonchalant, languid air of a bored society woman, she will never make a successful operator, but if she has the brisk, alert manner of a woman at a bargain-counter, buying a five-dollar shirtwaist for ninety-eight cents, then she will make an excellent one.

Even after a careful selection, however, much thought is required in order to keep the operators ready to give thorough and efficient work at all times. In a well-managed company great consideration is given their comfort and happiness. Their surroundings are bright, cheerful and attractive. Each girl is provided with a locker for her personal belongings. A comfortable retiring-room is furnished with chairs, couches and tables, and books, papers and periodicals are placed there to amuse the girls during their relief periods. In a lunch-room, a matron supplies them with coffee, tea or milk at the company's expense.

The training of the operators also requires as much care as the selection. Before the girls become skilled and efficient operators they must learn many things. First of all, they must become familiar with the names of the various parts of the telephone, as transmitter, receiver, etc. They must learn all about the switchboard, and the different sorts of jacks. They must learn how to use the cords to connect subscribers, and the significance of the different colored lamps. They learn about order wire buttons, pilot lamps—and perhaps a truly attractive thing—how to use the listening key. They also learn the language peculiar to the telephone operator, brief but explicit, quick but courteous, which has proven so convenient that it has become almost universal. The story is even told that a minister recently startled his congregation by announcing "Sing hymn double-one-o-six."

These things a telephone operator must learn are not easy by any means at the start, but after she has once mastered the details of the service, what a girl has to do and say is very simple. Each thing must, however, be said or done in exactly the right way by each operator. When a number is called, she must give that number only, for this is a case where "one just as good" will not answer.

Business men, accustomed to rapid and uniform service, are too likely, in many cases, to consider the telephone operator merely as a piece of machinery. This attitude is likely to be the cause of many things which try her patience. People are not all considerate of her; if they can not get a number at once, they frequently lose their temper, speak harshly, when many times it is not her fault at all, but some mechanical or electrical trouble with the line.

A rather humorous affair occurred recently which greatly overtaxed the operators on certain lines and caused a good deal of extra trouble. A local Zoo enterprisingly sent out postals to people all over the city, asking them to call up say "South 2337" and asks for Mr. Camel, or A. Lyon, A. Baer, etc. The credulous public was easily taken in, the specified number called, and the line was hot with calls for several days. It was a good advertisement, but rather hard on the telephone operator.

In spite of difficulties, the operators in general seem to like their work, and seldom change their occupation; or if they do, are extremely likely to return to it. Of course, allowance must be made for those who get married, and those promoted to better positions. They find their work interesting and fascinating. There is always room for advancement, which appeals to the ambitious girl, as she knows promotion depends upon herself and her ability. While they are in a way secluded, they are still in touch with the whole big city outside. They enjoy the companionship of other girls, and like their surroundings. Taken altogether, their life is not an unhappy one, and is far better than that of people engaged in many other occupations.

Safeguarding a Telephone Canvass

By H. L. Davis.

INDEPENDENT telephone companies commencing the operation of a new exchange need to profit by the experience of older organizations no less in the soliciting and contract departments than in other branches of their business. In nearly every case where poor results are obtained in these departments responsibility may be traced to the manager, being due to his failure to take proper precautions in the selection of solicitors.

To emphasize the importance to telephone companies of avoiding such a mistake, the writer believes that the experience of a certain Independent company in New York State may be useful. This company planned a regular soliciting campaign, but employed to manage its soliciting department a man whose experience was limited and, he, in turn, employed inexperienced solicitors. All that was expected of these solicitors was that they should secure not less than a certain number of subscribers each day and the kind and class of subscribers whose signatures they brought in was not considered. The result was that the solicitor, in order to get the required number each day, accepted contracts which represented all kinds of undesirable business. In many cases a name was secured on a contract through sheer trickery, the solicitor making the signer believe that he was only signing a petition to permit the company to construct lines on the street, or for some other purpose which he did not fully understand. Signers were also made to believe that the telephone was to be installed free for a year or more, or that the instrument would be installed on trial and be removable without any expense to the user. This was not even the worst of the frauds practised, for in many cases names were taken from the city directory, and written on the contract by the solicitor himself without having called on any of the parties.

A great many of the subscribers whose names were secured were people in poor circumstances who could not afford a telephone at any price. When a telephone was actually installed in the homes of such persons the company was compelled to submit to another useless expense in its final removal. No great effort was made to secure the better class of people as subscribers, and the result was that when the company commenced operation the best business places would not subscribe for the reason that they could not reach the places they desired to talk with most. Great expense was incurred in constructing lines to all of the persons improperly represented as subscribers, and many of these lines were vacant for several years.

The company was finaliy compelled to engage experienced solicitors to save the best of the subscribers who were secured by misrepresentation, and to secure genuine paying subscribers along the lines already built. After much hard work on the part of expert men the subscription list was built up to nearly 3,000. Had the company engaged these experienced men in the first place, they would no doubt have started the exchange with at last 4,000 subscribers and would have been in much better shape financially. There have been hundreds of other companies throughout the country who have gone through a similar experi-

Digitized by Google

ence, and who could add many facts as to the underhanded methods used by men employed in such work. Such stories would only be additional evidence to prove what is already evident to any thinking manager, namely, that dishonest solicitors are a curse to any company, and by engaging them many companies have been greatly handicapped and some times financially ruined.

There is no department connected with the telephone exchange more important than that which handles the soliciting and, this being a fact acknowledged by experienced telephone men, it is surprising that so few companies are careful in the selection of a man to manage the department. The man in charge is responsible for all of the work done by solicitors, and if they do not thoroughly canvass the city and secure the best people as subscribers or if they secure business from irresponsible people, or by deceit or trickery, it is his fault. In such an event he should be condemned and the result of his work made known to other companies and to the telephone journals so that they can inform their readers and warn all those contemplating engaging men for such work of the particular forms of deceit which have been practised. Honest work should also be made known so that telephone companies can profit by good methods. In this way the Independent companies will be greatly benefited.

Proper conduct of a canvass requires that every contract be verified before being accepted by the company. This can be successfully done in many ways, and an experienced contract agent who has the best interests of the company at heart can and will establish a satisfactory system.

THE INDIANA LEGISLATURE CONSIDERING MEASURE WHICH WILL REGULATE TELEPHONE COMPETITION.

A BILL has been introduced in the Indiana Legislature, with every prospect of being enacted into law, the primary object of which is to prevent rich and powerful corporations from indulging in "cut throat" methods to destroy competition.

The bill, in effect provides that if a franchise corporation, having competition in its home field, reduces the price of its service or commodity the new figure shall during the remainder of the life of the franchise be the franchise price and the company is prohibited from increasing it.

While the bill offers similar protection to all franchise corporations, it is said to be primarily aimed at the Central Union Telephone Company, and will prevent that company from further practices of reduction of rates until competition is destroyed with a subsequent return to the old monopoly or franchise rate.

HEAD GUYING AND SLEET STORMS.

RECENTLY in an Illinois town a telephone company suffered heavily from the destruction of its lines during a sleet storm. Where the lines were run practically straight for a distance of four miles a great many of the poles went down. The manager of the company states that he believes that a few extra precautions in the way of head guying would have been useful in diminishing the loss. He advises that telephone companies, when building a long, straight run will do well to bear in mind that the line may some time be called upon to support a weight far beyond that of the mere wires.

DATES FOR REDUCED RATES TO IOWA INDEPENDENT TELEPHONE CONVENTION.

AS announced in earlier issues, reduced railway rates have been granted from points west of Chicago to all telephone men who attend the convention of the Iowa Independent Telephone Association, which is to be held at Sioux City, Ia., on March 19th, 20th and 21st. Application for the special fare may be made on and after March 16th, and the reduced rates hold good for the return trip up to and including the 3d of April. In order that a purchaser may secure the round-trip fare at one and one-fifth times the regular one-way rate he must take a receipt at the time he buys the ticket from his home agent, and full fare must be paid for the ticket. Before he returns to his home he can go to the secretary of the Passenger Association at Sioux City, and upon payment of 25 cents can obtain a certificate which will entitle him to return home for one-fifth fare. A great many telephone men are arranging to take advantage of this reduced rate, as it will enable them to take part in the exceptionally interesting proceedings at the convention at a very low cost.. The best investment any company can make during the year is to send at least one representative to this meeting.

INDEPENDENT TELEPHONE MANAGERS OF HILL COUNTY, TEXAS, REPORT PROGRESS.

AT Hillsboro, Texas, there was called on Feb. 9th a meeting of the managers of Independent telephone companies operating in Hill county. Among those present were: H. H. Davenport, secretary and general manager of the Hillsboro Telephone Co., Hillsboro; W. H. Legan, Citizens Telephone Co., Itasca; W. D. Smith, Bynum Telephone Co., Bynum; J. R. Thaxton, Malone Telephone Co., Malone; W. W. Henson, Jesse and Kirby Telephone Co., Jesse; F. L. Latham, Aquilla and Whitney Telephone Co.; Lee Kirkpatrick, Lovelace Telephone Co., Lovelace; W. H. Legan, Abbott Telephone Co., Abbott. These gentlemen represent 2,145 telephones in Hill county. The first business of the managers was to organize themselves into a permanent association, electing Bud Terry as chairman and H. H. Davenport as secretary. Mr. W. D. Smith of Bynum, Mr. F. L. Latham, of Whitney, Mr. W. H. Logan, of Itasca, were chosen as an advisory board.

Discussion of various points in connection with the operating of the systems added to the information of the individual members in a way which brought out clearly the benefits to be derived from forming an association. Reports from all the managers in all parts of the county showed that the growth of their business had been good. In Hillsboro both city and rural lines are being rapidly extended. At the close of the meeting the visiting telephone men were the guests of H. H. Davenport, manager of the Hillsboro Telephone Company, at an enjoyable dinner.

WISCONSIN INDEPENDENTS TO PREPARE FOR EXTENDED TOLL SERVICE AT NEXT MEETING.

THE adjourned annual meeting of the Independent Telephone Association of Wisconsin will be held at Madison, March 7th and 8th, 1907, at which time will be perfected the organization of district associations, as auxiliaries to the State association, in the manner followed in Ohio, Indiana, Michigan and other States.

At the previous meeting in Madison on Jan. 17th and 18th, committees on District Organization, Clearing House, Nomination and Membership were elected by the delegates. Representatives from each congressional district have organized in each of their respective districts, so that a complete and perfected organization will assemble at Madison on March 7th and 8th in Turner Hall for the completion of important details relative to the building of long distance trunk lines by the Independent Long Distance Telephone Company of Wisconsin, the compilation of statistics and the election of officers for the coming year.

The representative of each district is instructed and requested by W. F. Goodrich, the secretary of the association, to bring a map or sketch of his district, showing all Independent lines and the number of telephone users, that a comprehensive system of toll lines may be established at once.

With the prospects of an early spring, this meeting will mark the beginning of important developments in the Independent field in Wisconsin.

LAWSUITS ARE EXPENSIVE.

A LAWSUIT involving the sum of twenty-five cents has been tried at Spencer, Iowa. The cost of the suit amounts to $114.80. The case grew out of a twenty-five-cent telephone charge. The Western Electric System was the plaintiff and Knox Walters the defendant. A stranger used the telephone in Walters' livery barn to talk to a neighboring town, and the telephone company claimed that Walters guaranteed the charge, sued him for it, and finally obtained judgment.

SERVICE TESTS AND HYSTERICAL NEWSPAPER REPORTING.

IN a certain northern city the conditions in the operating rooms of a rather unpopular telephone company are being investigated.

Incidentally the fact has been brought to light that each day a certain number of lines are connected to the desk of an operator who "listens in" and takes notes concerning the nature of the business transacted and other details of importance to the public. Newspaper men, for once, have seemed to miss the significant feature of this work, and are attempting to make a sensation of the violation of the assumed right which the telephone users have to carry on a secret conversation.

Perhaps there is no feature of the work of a telephone company which is less understood than that in the operating and traffic departments which leads directly to the improvement of the service. Although the introduction of the common battery switchboard, with its line lamps and double supervisory signals made possible great advances in the spread and accuracy with which connections were made, these possibilities were by no means realized until the development of traffic studies along what have come to be recognized as standard lines. In the prosecution of this work the regular recording of observations made by "listening in" has been of the greatest value. From these observations, as is well known, telephone men are in the habit of making up statistical tables, which furnish data for the traffic department without ever giving details of actual conversations.

The commodity in which a telephone company deals is traffic, and any business man should realize the absolute necessity which compels a concern to know, as nearly as it may, the nature of the product which it sells. Service observations alone have furnished the data which enable telephone companies to improve the efficiecncy of their operating, plan for the appropriate and economical extensions of their plants, and adjust complaints on an equitable basis. With the thousands of conversations overheard by operators under these circumstances, there are very few cases of injury to the interests of a subscriber arising from the giving out of information. The only cause for complaint seems to be a sentimental one, while opposed to such grounds are all the sound arguments based upon the utility of this method of improving the service. It is a pity that so valuable a department of research should be the object of sensational reports intended to appeal to the prejudices of imperfectly informed persons.

PATENTS AS SOURCES OF GENERAL TECHNICAL INFORMATION.

YOUNG men who are engaged in those branches of telephone work which require a knowledge of electricity realize that in order to promote their own advancement they must acquire as quickly as possible a large amount of technical information. No matter to what position their ambitions lead them to aspire they will be likely to have occasion to use such knowledge frequently. In looking for practical technical discussions in published works a great many of these young men overlook one of the most valuable fields. This is the descriptive matter included in many United States patents.

Whenever a patent is granted on any device the inventor is obliged to give such a description of the method of operation as is necessary to enable any person having an elementary knowledge of the art in question to clearly understand the new invention. In telephony, as in most other branches of electrical work, most advancement in the way of new designs, comes, after all, not from the discovery of new principles, but rather from designing new methods of applying old ones. For instance, in telephone circuits there are a certain number of what may be called elementary electrical or electro-magnetic principles. A relay, for example, owes its existence to the fundamental facts that when a coil of wire surrounding a bar of soft iron is traversed by an electrical current a magnetic field is created, and than any piece of movable soft iron in such a field tends to so change its position as to shorten the lines of magnetic force which pass through it. Beyond and built upon these fundamental principles there are a certain number of other principles, or basic combinations of principles, which are practically confined to telephone work. Among these may be mentioned such devices as the use of a condenser to permit the passage of alternating current, while shutting off battery current; the use of a repeating coil for various purposes; the use of a shunt circuit for controlling the operation of relays, etc.

It is with schemes of this latter class that the student is especially concerned. He needs to know how they are built up from the elementary principles, statements of which can be found in his text-books, and he must learn how they fit into the general plan of a telephone plant. Very much information of this sort is contained in patents, and, contrary to a rather wide-spread impression, is likely to be very clearly set forth. It is true that the portion of a patent which sets forth the claims of the inventor suggest a legal phraseology rather than that of technical literature, but this is by no means likely to be true of the descriptive portions of the document.

An example showing a special case in which general information is obtainable from a patent may serve to bring out the usefulness of this source. A young man in a city served by a single common battery exchange may be totally ignorant of the general method of operation which is essential for a trunking circuit between two common battery offices. He may not even know how orders for the use of these trunk circuits are passed from one exchange to another over a special "order wire." As to the actual circuit details which will satisfy the operating conditions he is almost sure to have a very hazy set of ideas. Almost any patent granted for a trunking circuit will contain a great deal of useful and reliable matter which will enlighten him on many of these details. Numerous other examples branching into widely different divisions of telephone work could be cited, all emphasizing a similar point.

In considering this plan for extending his knowledge, it is important that the student should not overlook the question of cost. While the price of a copy of a single patent, which any one may obtain by writing to the Commissioner of Patents, at Washington, is only five cents, any person who should attempt to secure every patent issued for a device having a bearing on telephone work would find the cost in a year rather larger than the expense justified by the benefit which he would be likely to gain. The best way for him to do would be to carefully choose after an examination of a well-prepared digest of patents, the numbers of those which may be safely assumed to contain general descriptive matter. Any one who attempts this will soon come to have a fine discrimination in the matter of names as well as in subjects. As the patents containing the clearest descriptions are likely to be those prepared for the most successful manufacturing companies, their possession brings the added advantage which is due not only to a certain measure of assurance as to their correctness, but also that which is derived from the knowledge that they are applied to devices which are in actual operation, and which the student is likely to meet in the regular course of his work.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

THE SPECIAL FRANCHISE TAXES OF NEW YORK.

We understand that the law of the State of New York making all franchises for the use of streets, highways, and public places, or mains, pipes, tanks, conduits or wires for any purpose taxable as special franchises and to be deemed real property, has been passed upon by the Supreme Court in a recent decision. We should be very much obliged for a statement by you in the columns of THE AMERICAN TELEPHONE JOURNAL of the construction put on this law and whether the act was held to be constitutional. H. F. C.

THIS law has been recently sustained by the United States Supreme Court (25 Sup. Ct. R., 705). The contention against the validity of the tax has been that it impaired the obligation of the contracts under which these franchises were obtained. In many cases, the companies had paid a gross sum to obtain a franchise or were required to pay annually either a fixed amount or a fixed percentage of their earnings, and these companies contended that such payments were all that could be required of them on account of their franchise. The court overruled this contention, holding that the contract did not provide that these payments were to be a substitute for taxes. Because the State had not purposely relinquished the right to tax them, what the companies had paid for the franchise did not raise any implication that the State had relinquished its power to tax this property the same as any other property. This case did not arise in litigation to which either a telephone or telegraph company was a party, but the same ruling would naturally apply to all companies governed by the act.

WHEN COMPANY IS EXCUSED FROM ERECTING GUARD WIRES.

A break in our wires occurred during a great and unusual sleet storm with the result that one of our wires fell on an electric wire that crossed it horizontally, the end falling onto the highway. A horse belonging to a farmer that lived nearby was killed. He now claims that our company should pay for the horse because there was no guard wire between our line and the heavily charged wire of the lighting company. Please tell us whether it is always a rule that guard wires must be maintained where telephone wires cross wires belonging to other companies. T. M. C.

THERE is no such general rule known in the law. The principle that it is the duty of electric companies to erect guard wires extends only so far as to declare that it must be done when the circumstances render it advisable for safety. Where it is not customary to erect guard wires nor practicable to do so, companies are not bound to maintain them. Aument vs. Penn. Tel. Co.; 28 Pa., Super Ca., 610.

PERCENTAGE ON RECEIPTS FOR TOLL LINE SERVICE OUTSIDE THE CITY UNCOLLECTABLE AS A FRANCHISE FEE.

THE City of Lancaster, Mo., brought suit against R. W. Briggs, the holder of a franchise, to recover certain money alleged to be due the city as payment for the privileges given by the franchise. The ordinance which granted the franchise provided that grantees "agree to pay to the city 2 per cent. per annum of the gross receipts collected from the use of the city telephone system." The company was required to make affidavit to the amount of receipts as a basis for figuring the percentage due. The company reported only such receipts as were derived from the rental of telephones in the city, but the city insisted that the words "gross receipts collected from the use of said telephone system" should include earnings received from long distance service rendered by the telephone company to the patrons as well as rentals collected for telephone use in the city. The court held that the gross receipts intended to be used as a basis for figuring the franchise tax referred to the system "within the present and future corporate limits of the city" and expressed the opinion that the ordinance left no room for doubt that the city agreed to restrict its charge to the earnings of that part of the company's system within the city limits. The earnings from toll business over long distance lines connected with Lancaster and other cities and towns would not be included, but the court held that the parties intended that earnings from all sources within the city should be included in the term "gross receipts." These earnings, it was decided, consisted of rentals, of not only telephones in the city, but also the percentage received by the company as the proceeds of toll line business that required the service of the Lancaster exchange in its transaction. Judgment in favor of the company was reversed by the Kansas City Court of Appeals, and the case sent back for a new trial. City of Lancaster vs. Briggs, 96. S. W.; 314.

WHEN DESTRUCTION OF A FENCE IS MALICIOUS.

IN Mobile County, Alabama, a suit was brought against a telegraph company for trespassing upon the property of an adjacent owner, the trespass being alleged to be the cutting down of timber and the breaking down of fences, and piling brush and debris upon the property of the owner. The evidence in the case showed that the plaintiff's fence was cut and destroyed in several places, and that the doing of this was not at all necessary to the repairing of the telegraph company's lines. The plaintiff recovered what are called punitive damages, or damages by way of punishment, in addition to the damages he proved that he had actually suffered and the Supreme Court of Alabama, in reviewing the case, held that the recovery was proper. Western Union Telegraph Co. vs. Dickens (Ala.) 41S., 469.

COMPANY MAY PROTECT ITSELF AGAINST USE OF TELEPHONE FOR ILLEGAL PURPOSES.

We have very good reason to suspect that a certain applicant for our service is engaged in keeping a gambling establishment, and wants the instrument to connect with a nearby saloon from which any attempt to raid his establishment could be observed and warning given. We cannot prove this to be the fact as you can see, but the situation is such that we think it is undoubtedly the case. We want him to give us assurances that the telephone is not to be put in his gambling rooms, but he refuses to promise us anything in this line, and practically says it is none of our business. What are our rights in the matter? H. J. B.

A TELEPHONE company is not obliged to furnish its services for illegal purposes, and in fact is prohibited from so doing. It may therefor require assurances from any intending subscriber, and if they are not given, may refuse to install a telephone. It is not necessary that the company should have absolute proof of the intention to use a telephone for illegal purposes. It might properly insert a clause against the use of its instrument for improper purposes in the contract, and it would be entitled to refuse service if the contract was not signed. If any additional and unusual assurances are required against improper use, the evidence upon which the company based its requirements would have to be sufficient to warrant suspicion. Cullen vs. N. Y. Tel. Co., 106 App. Div., 250, 94, N. Y. C. 290.

QUERIES

NOISE FROM GASSING OF STORAGE BATTERIES DURING CHARGE.—(824.)

Under date of November 24 Samuel Ferguson writes in your journal regarding mercury arc rectifiers and in the article states that the noise induced in a telephone exchange by use of such rectifiers is even less than the noise caused by normal gassing of the batteries when under charge. by other sources.

Will you kindly arrange for me to learn in what way gassing causes noise in a telephone system and if it is really so. A. E. C., Calif.

The noise produced in telephone circuits by the gassing of a storage battery under charge is entirely different in character from that produced by the charging source, generator or rectifier.

The forming of large bubbles of gas on the electrodes and their sudden detachment as they seek the surface of the electrolyte causes repeated slight changes in the internal resistance and E. M. F. of the cells. This produces a crackling noise intermittently in the attached telephone circuits. It is claimed by advocates of the rectifier that owing to the fact that the current delivered to the batteries by this equipment is pulsating and dies away to nothing after each pulse, instead of being practically continuous, as in the case of the generator, the gassing is much more uniform and the noise is consequently reduced. The theory is that the cessation of current between pulsations permits or rather causes the gas to be liberated in smaller bubbles at more frequent intervals. This is a question altogether apart from a comparison of the intensity of the hum, or musical note due to the frequency of conversion or rectification with the noise introduced by the action of the commutator of a well-designed charging generator.

CODES FOR RURAL LINE RINGING.—(825.)

Will your readers kindly give the best method for arranging rural line calls so that directory numbers will indicate line and ring?

In response to this inquiry, published last week, we have received a great variety of codes, some of which are published herewith. We shall be glad to have readers send any new ones, and in each case set forth any advantages and disadvantages observed in the operation of the systems.

A simple code of long and short rings in which the code numbers indicate the number of rings on the line is contributed by H. L. M., Vt. This code is as follows:

2 · ·	11 — ·	21 — — ·	31 — — — ·	41 — — — — ·
3 · · ·	12 — · ·	22 — — · ·	32 — — — · ·	42 — — — — · ·
4 · · · ·	13 — · · ·	23 — — · · ·	33 — — — · · ·	43 — — — — · · ·
5 · · · · ·	14 — · · · ·	24 — — — · · · ·	34 — — — — · · · ·	
6 · · · · · ·				

Table 825-a.

This provides a code for a line having twenty telephones, which is as heavy a load as this company believes a line should have to carry. On the above code the long and short rings are indicated by the length of the dashes, as in other tables presented on this page. The code number follows that of a line, separated by a dash, in the directory—as 231-34 means line 231, ring 3 long and 4 short.

It is to be noted that this code exactly follows the requirements of the query. Some of the other codes do not fully answer these requirements. One code which has been received employs a twenty-eight party code which the operator must memorize. It is given in Table 825-*b*, contributed by L. C. H., New York. The three left hand columns give the code, while the right hand column is taken from the directory, showing how the list of names appears in connection with the numbers. The novelty of this code consists in the combination of letters and numbers. Possibly some other reader may have a few interesting things to say about such a practice. Subscribers who wish to know the code, in order that they may ring other parties on their own line, can readily obtain it, as it is conspicuously printed in the directory.

The last three codes on this page were all contributed by the manager of a New York company, with permission to publish

A · —	M — —	1 · — — ·	8-N	Baker, Ray
B — · · ·	N — ·	2 · · — ·	7-F	Bliss, N. W.
D — · ·	P · — — ·	3 · · · — ·	7-V	Brainard, E. O.
F · — ·	Q — — · —	4 · · · · —	4-H	Barnes, C. E.
G — — ·	S · · ·	5 · · · —	13-7	Bark
H · · · ·	U · · —	6 — · · · ·	13-3	Burt, W. D.
I · ·	V · · · —	7 — — · · ·	6-N	Baldwin, V. E.
J — · — ·	W · — —	8 — — · · ·	15-A	Baldwin, F. E.
K — · —	X — · · —	9 — — — ·	13-D	Bliss, Dr. T. C.
L —				

Emergency Call, 8 to 12 Short Rings.

Table 825-b.

over the signature H. L. J. In Table 825-*c* is shown a code for rings up to 30. Here the code has apparently been carefully worked out to give the least annoyance from ringing on the line, but requires an effort of memory on the part of the operator, and

1 ·	9 · — — —	17 — —	24 — · · ·
2 · ·	10 · · — —	18 — ·	25 — — · ·
3 · —	11 · · · —	19 — — — ·	26 — — — — ·
4 · · ·	12 · — · —	20 — — ·	27 — · — ·
5 · — —	13 · — — ·	21 — · ·	28 — · · —
6 · · —	14 · · — ·	22 — · — ·	29 — — · —
7 · — ·	15 · — · ·	23 — — — —	30 — · — —
8 · · · ·	16 —		

Table 825-c.

would have to be printed in the directory for the benefit of subscribers.

Table 825-*d* shows a simple code for a twenty party line in which a very slight burden is imposed in the way of ringing.

1 · ·	6 — — ·	11 · · · ·	16 — · — ·
2 · —	7 · · —	12 — · · ·	17 · — — ·
3 — ·	8 — · ·	13 · · — —	18 — · · —
4 · · ·	9 · — ·	14 — — · ·	19 · · — ·
5 · — —	10 — · —	15 · · · —	20 · — · ·

Table 825-d.

This important advantage should be appreciated by both operators and persons on the line who have to listen to distinguish between the rings in order to know when to answer.

The final table, No. 825-*e*, gives a code, worked out on something the same principle as Table 825-*a*, but providing for 46 parties. Apparently Mr. J. believes in "loading 'em up," as he closes

1 · ·	13 — · · ·	25 — — · · · · ·	36 — — — · · · · · ·

IN THE OPERATING FIELD

BURGLARS USE TELEPHONE TO DETERMINE SAFE PROSPECT FOR THEFT.

TELEPHONES have frequently been used for the purpose of apprehending criminals, but seldom have they been used by burglars to discover whether the object of their attempts was unguarded. That is just what happened, however, in a little suburb of Toledo a few nights ago, when the residence of Pastor Huddle of the Evangelic Church was looted and everything of value in the parsonage taken with the exception of the morning's collection.

An investigation of the affair afterward brought out the fact that nearly every person in the village had been rung up by telephone on that night. If a call was answered the reply was simply the slamming of the receiver. All the houses which failed to reply to the calls were marked and though only one was visited, evidence showed that an entrance into several had been attempted.

PROPOSED LEGISLATION IN PENNSYLVANIA.

AN act has been introduced into the House of Representatives of Pennsylvania by Mr. W. S. Reynolds providing that no telephone, telegraph or other public service corporation shall enter upon or occupy in any manner whatever, any street or highway within any city or borough of the commonwealth without first making application in writing to the proper authorities of such city or borough and obtaining their consent or permission, which shall be given by ordinance only and upon such conditions, stipulations, and regulations as the respective municipal authorities may deem necessary. The purpose of this proposed legislation seems to be to make a franchise necessary from the municipalities before a telephone company can commence building in any city or borough. It is a step backward from the liberal law of 1905, when by act 205 the former act of April 29, 1874, was modified and it was provided that telephone and telegraph companies might build their wires, cables, posts and subways along, under and upon the roads, streets and waters of the State, subject to reasonable regulation by the municipality, through which they passed, but not so as to incommode the public or interrupt navigation. This former legislation recognized the municipality's right to regulate the use of the streets under the police power, a right which would have existed without such provision. The present proposed legislation would make the consent of the municipality a condition precedent to commencing business and would give the municipality the right to refuse such consent if it desired. Such an act would hinder telephone construction in the State. The proposed act is not very different from act 132 of the laws of the session of 1885, which made application to the municipal authorities of the city, town or borough, and their subsequent permission, necessary before a company could erect poles and run wires in the streets. This act provided that permission could be given by ordinance only and the municipality might make such conditions and regulations as it saw fit. It would seem that this act of 1885 which amended an act of May 1, 1876, supplemental to an act of 1874, was modified by the more liberal legislation of 1905.

BEAVER COUNTY TELEPHONE COMPANY CARRIES ITS APPEAL FOR A FRANCHISE DIRECTLY TO THE PEOPLE IN ROCHESTER, PA.

FOR some time past the Beaver County Telephone Company has been meeting with determined opposition to its efforts to obtain a franchise in the city of Rochester, Pa., although it has been granted full rights in all of the rest of that section of the county. After realizing the source of the opposition to this company, General Manager S. C. Thayer came to the conclusion that the only way to secure an entrance to the city was to carry his case to the people directly. He has therefore prepared a circular entitled "The Battle of Progress," which sets forth his case. It is an exceptionally clear presentation not only of the advantages of Independent service, but of the disadvantages which people suffer under the present monopolistic arrangements. It has already produced an excellent effect, and it is believed that at the Spring election the people will pay special attention to this matter of a telephone franchise, and elect councilmen who are willing to obey their wishes.

COUNTY OFFICES IN BELMONT COUNTY, OHIO, TO BE SUPPLIED WITH INDEPENDENT SERVICE EXCLUSIVELY.

THE Bell telephones are to be removed from the county offices of Belmont county at Martin's Ferry, O., by order of the County Commissioners. This summary action is said to be due primarily to the fact that the service of the Bell company has for a long time been very poor. In the discussion which has arisen over the matter, there have been brought to light some very interesting facts in regard to the rates charged by the Bell company throughout the town. It is said that for the same classes of service various rates were in effect; the highest was the published rate, and from this the cost of service was graded down according to the bargaining ability of the individual using it. A canvas is reported to have brought out the fact that a large proportion of the Bell subscribers are getting service at reduced rates, while some of them are paying nothing at all. Business men who have been paying the high rates are planning to take an action similar to that of the county commissioners.

TOLL LINE CONSTRUCTION TO BE CARRIED ON RAPIDLY IN NORTH DAKOTA.

PLANS have already been made by the North Dakota Independent Telephone Company for the erection of more than one hundred miles of new toll lines. These extensions of the present system will be made in the vicinity of Hope, Valley City and Jamestown, and they were decided upon at a recent meeting of the board of directors held at Minneapolis. The trunk line which the company is now building from Fargo to Glendive, Montana, has been nearly completed, and will probably be in operation very soon. In addition to this toll line work the company is to reconstruct the exchanges at Bismarck, Valley City and Casselton, the installation of new switchboards being included in the plans for the two latter plants. At the directors' meeting the officers of the company were reelected as follows: President, H. R. Lyons, Mandan; vice president, J. D. Brown, Hope; second vice president, Robert Jones, Fargo; treasurer, E. J. Weiser, Fargo; secretary, A. B. Cox, valley City.

CUMBERLAND COMPANY DODGES ISSUE WITH MISSISSIPPI RAILROAD COMMISSION.

THE railroad commission of the State of Mississippi, which has jurisdiction over telephone and telegraph companies, is receiving complaints daily from various portions of that State against the Cumberland Telephone and Telegraph Co. (Bell), alleging that the company is not complying with the orders of the commission to grant cheaper rates and furnish free service between exchanges located in the same county.

Three months ago the Mississippi commission ordered the Cumberland company to give free service between exchanges located in the same county. The Cumberland company has done this in Tennessee since it was organized and Mississippi asked the same treatment. The company protested strongly against the order, but the commission would make no abatement and the Cumberland company agreed to comply. Four months have

Digitized by Google

IN THE OPERATING FIELD

passed since the company agreed to supply this service and the citizens are complaining loudly. Through many counties in Mississippi the Cumberland company had but one line connecting the small towns where it operated exchanges, and had been charging regular long-distance fees for use of the line. Now, since such service is to be free, the increase in the amount of business transacted has been so great that these single lines will not handle the traffic.

Leland Hume, general manager of the company at Nashville, Tenn., has been asked by the commission to explain the delay in carrying out the commission's order, and has reported that the company has not been able to stretch the additional wire for want of labor and material. In a number of Mississippi counties the company has from three to six exchanges, the subscribers at any of them having the right to call parties on the other exchanges without additional cost, and Mr. Hume says that the free use of the single lines has so burdened them that additional lines are necessary, and they cannot be furnished on such short notice. The commission has filed its reply and copies have been sent to all the complaining subscribers. These subscribers now, however, are reporting to the commission again that the company has made no effort to comply with the order, and contend that the delay is made with the object of defeating the commission's purpose. They claim that the conditions are injurious to their business interests, and should be remedied without delay.

INDEPENDENT COMPANIES URGE APPLICATION FOR CHARTER IN CONNECTICUT.

COUNSEL for the Connecticut Home Telephone Company have prepared an application for a charter which has been presented in the Senate by Senator McGovern. This application asks for substantially the same privileges which are now enjoyed by the Southern New England Telephone Company. The capitalization is set at $500,000 initially, with the privilege of increasing to $5,000,000. Under the provisions of the charter the corporation may construct, maintain and operate a telephone system and exchanges in towns of more than 15,000 inhabitants only after it has been fully established to the satisfaction of a superior court that it has bona fide contracts from residents or business men equal to one-tenth of the number of tax payers. When the company proves these facts, the judge is authorized to make a finding that public convenience and necessity require the construction of a system. Such a process is not necessary in towns of under 15,000 inhabitants under the terms of the proposed charter.

ATTEMPT OF OFFICIALS TO OUST BELL COMPANY FROM A TENNESSEE COUNTY.

THE Shelby County Court, at Memphis, Tenn., has instructed the county attorney to "investigate the charter of the Cumberland Telephone and Telegraph Company, and if found to be defective, as the court believes it to be, to have all poles of the company in that county removed." The Cumberland company is operating in Memphis on a State charter under the old State act of 1875 and has no franchise from or contract with the county of Shelby or city of Memphis. The county attorney is now conducting the investigation.

CARTHAGE, MO., RECEIVING SERVICE FROM INDEPENDENT COMPANY WHICH HAS DEVELOPED RAPIDLY.

THE benefit to the city of Carthage, Mo., which has come through the introduction of Independent telephone service is indicated by the growth of the company which furnishes it. Four years ago the Home Telephone Company had 537 subscribers in the city of Carthage, with about 1,600 telephones on its system connected to lines outside of the town. At the present time the Carthage exchange has 1,400 subscribers, and to the lines of the other exchanges are connected more than 6,000 telephones. The importance of making it easy for farmers living over a wide range of territory to obtain quick connections with business houses in the city led to running out a great many rural lines directly from the Carthage exchange. On these lines there are now said to be over 500 instruments, giving a service which is very much appreciated both by the town and country subscribers. Rapid as has been the growth in the past, building of many new lines is expected to be necessary this year.

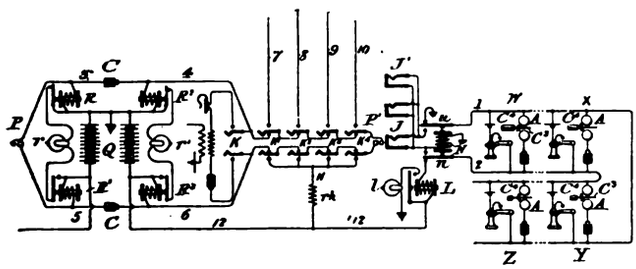
TELEPHONE PATENTS

PARTY LINE TELEPHONE SYSTEM.

W. W. Dean, Elyria, O., patents (No. 842,772; dated January 29, 1907; filed April 17, 1905; serial No. 255,961) and assigns to the Dean Electric Company, Elyria, O., a party line telephone system.

This patent covers an arrangement for the well-known Dean harmonic signaling system. In the figure shown each of the keys K^1, K^2, K^3, K^4 is connected to a generator giving a particular frequency. Subscribers' stations *W, X, Y, Z* are provided with bells tuned to respond to these different frequencies. This tuning is effected by an adjustment of the clapper upon its rod, and the characteristics of the spring upon which the rod is mounted.



A current of proper frequency causes an initial movement of the armature of the corresponding bell, which is greatly increased until a ring is effected. In connection with the generating machinery a suitable governor is provided, to regulate the speed and give the desired frequencies. This patent and others upon this system, which have recently been granted, contain exceptionally interesting discussions of applications of the harmonic signaling principle.

CABLE HOLDING CLIP.

Augustus Andrews, Gulfport, Miss., and Lawrence M. Galliher, New Orleans, La., patent (No. 841,914, dated January 22, 1907; filed November 3, 1906; serial No. 341,954), a cable holding clip.

This clamp consists of a single piece of metal bent in reverse directions to form two hollow cylindrical portions adapted to clamp the cable and messenger wire respectively. When in place the device is locked firmly to the cable and to the supporting strand by folding over suitable shaped projecting members.

TELEPHONE SYSTEM.

R. M. Eaton, Philadelphia, Pa., patents (No. 843,078; dated February 5, 1907; filed March 30, 1904; serial No. 200,705) and assigns to the Keystone Telephone Company, Philadelphia, Pa., a telephone system.

The object of this invention is to provide a means for enabling an operator at an exchange using divided switchboards to secure connection with an idle line to the exclusion of all other operators. This is accomplished by closing a key associated with the line which puts her telephone set in connection with the line, but cuts out the wires leading to operators' talking circuits at each of the other stations.

TELEPHONE SWITCH.

Klas Weman, Buffalo, N. Y., patents (No. 843,053; dated February 5, 1907; filed July 13, 1906; serial No. 325,997) a telephone switch.

This invention covers a self-contained switch adapted to be inserted in the handle of a telephone of the hand-micro type. The necessary switch springs are mounted in a small channel, which may be inserted in a slot in a suitably constructed handle, and fastened in place by screws. The actuation of the springs is accomplished by an outer lever of insulating material, which is mounted on a spring in such a way as to leave the circuits open when in its normal position, and to be moved inward into line with the circumference of the handle for the necessary changes in the contacts when the handle is firmly grasped. Certain connections from the interior of the handle may be made by flexible cords before the switch is in place, the remainder being made through the screws which hold it in position.

AUTOMATIC TELEPHONE KEY.

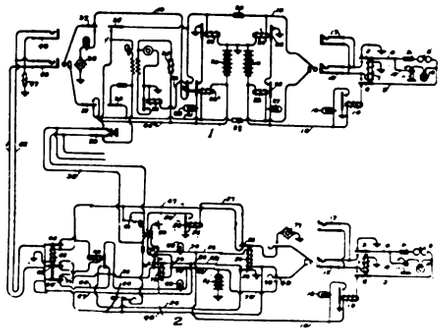
Ernest A. Faller and Oscar Alvin Danielson, New York, N. Y., patents (No. 824,291; dated June 26, 1906; filed October 6, 1904; serial No. 227,437) an automatic telephone key.

In telephone systems of the semi-automatic type covered by previous patents of this inventor it is necessary for the operator to actuate a key to cause the illumination of a trunk-indicating lamp after she has plugged in to the switchboard division indicated by the signals. To obviate the necessity of actuating this key and thus to further simplify the duties of the operator, the inventor provides that the key shall be actuated by an arm which is so arranged beneath the cord shelf as to form a socket for the plug and is intended to be released on the removal of the plug. For restoring the key to its normal position, which should be accomplished before the plug is returned to its socket, an electromagnet, with suitable circuit connections, is provided.

INCOMING TRUNK LINE.

Howard M. Post, Chicago, Ill., patents (No. 841,339; dated January 15, 1907; filed March 14, 1906; serial No. 305,993) and assigns to the Kellogg Switchboard and Supply Company, Chicago, Ill., an incoming trunk line.

When the A operator plugs in a circuit including battery is closed through supervisory relays at the A position and high resistance trunk relay 46. Owing to this high resistance the supervisory relays are not operated, but relay 46 is energized, closing circuit of the guard lamp 62, the illumination of which notifies the B operator that the A operator has inserted her



plug. The B operator tests the desired line, and if it is busy is notified by a click, caused by the operation of test relay 56.

The insertion of her calling plug causes battery to flow through winding of relay 50, which cuts off the test relay, and connects the tip strand through for conversation. The operation of this relay disconnects the guard lamp 62, and illuminates ringing

Digitized by Google

lamp 69 through the contacts made by armature 53. Current flows through cut-off relay 7 from battery 51 to disconnect the line relay. During the process of ringing cut-off relay 7 is actuated from battery 51 through conductor 79 and contacts 78 of ringing key.

When the called subscriber responds relay 45 is operated by current from battery 51, passing over conductors 63, 80, 52, winding of relay 50, sub-station set and back through the other side of the line to relay 45. The operation of relay 45 cuts off the high resistance relay 46 and extends the circuit of battery 29 at the A exchange to the instrument of the subscriber connected at the B board. The line of the called subscriber is thus substituted for the path of current from battery 29 through high resistance trunk relay 46. The supervisory relays at the A position may be controlled through this circuit, while battery 29 furnishes energy to the transmitter of the called subscriber over a circuit free from inductive devices of any sort.

The operation of relay 45 opens the circuit of guard lamp 62 at back contact 66, and closes the circuit of relay 72 at its front contact 74. This lamp is therefore prevented from lighting when circuit is closed at back contact of trunk relay 46. Ringing lamp 6 9is extinguished by the operation of relay 72 through the breaking of back contact 71. A locking circuit for relay 72 is completed through armature 53 of relay 50. When the B operator hangs up, relay 45 allows its armatures to drop back, inserting high resistance trunk relay in the path of current from battery 29, and causing the illumination of the supervisory lamp at the A position. When the A operator removes plug from the trunk jack relay 46 will be energized, closing circuit of disconnect lamp 62 at its back contact. The illumination of lamp 62 is a signal for the B operator to pull down the connection.

AUTOMATIC RINGING DEVICE.

William W. Dean, Elyria, O., patents (No. 838,244; dated, Dec. 11, 1906; filed Jan. 16, 1906; serial No. 296,287 and assigns to the Dean Electric Co., Elyria, O.) an automatic ringing device.

This patent covers an arrangement for the application of ringing current through a suitable switch, and its maintenance in connection with the line until the subscriber answers. The method by which this is accomplished is designed to permit of the use of selective ringing current of different frequencies.

In the accompanying figure is shown a ringing key K, the action of which in connecting ringing current to the line will be evident. If the operator wishes to call the subscriber at T, she depresses cam k, which is locked in position by the action of detent-lever k^4 upon lever k^7. The necessary movement of detent k^3 is effected in opposition to the tension of spring k^{11},

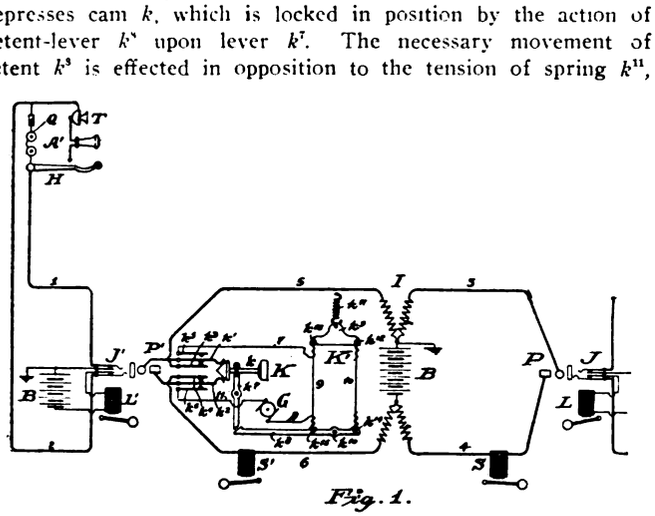


Fig. 1.

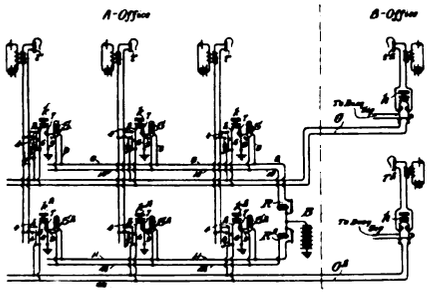
which thereafter holds k^8 in place. A commutator, preferably inserted in the ringing circuit, makes and breaks the generator current, giving intermittent ringing until the removal of the subscriber's telephone. The control of the cam is effected by a special mechanism of the exchange as follows: Wires 9 and 10 are stretched between pins on a strain plate, normally holding apparatus in the position shown in the figure. This balance condition persists until wire 10 is elongated by the heating effect of a suitable current. Resistance of the line is sufficient to prevent a passage of any large quantity of current from the ringing generator over the wire 9, which forms a part of the generator circuit, during ringing. Wire 10 is completely insulated. This pair of wire frames, which is known as a thermic controller, is in connection with the supporting device.

As soon as the receiver at T is removed from the hook, the resistance through the line and substation set is lowered, current rises in wire 9 until it becomes very much warmer, and the consequent expansion of this wire destroys the balance between it and wire 10, causing lever k^9 to be tilted, until it releases lever k^7 on account of the tension of the spring k^{11}. As soon as the key is released, wire 9 cools off and the apparatus is again ready for action.

BUSY SIGNALS FOR ORDER WIRES.

Henry Linton Reber, St. Louis, Mo., patents (No. 838,749; dated December 18, 1906; filed March 29, 1905; serial No. 252,655) a telephone system.

This patent covers an arrangement of busy signals in con-



nection with order wire circuits extending between local and trunk positions. Its purpose is to make it possible for the subscriber's operator to avoid delay by always being able to select an idle incoming trunk operator. In the accompanying diagram the subscribers' operators' positions are at the "A" office, and the trunk operators' positions at the "B" office. Order wires O and O^2 extend between the two switchboards. A operators' telephones r, r may be connected with either order wire by keys k k^2. Each of these keys has an additional spring that is connected with ground, the normal contact being wired to the signal S, associated with relay R or R^2. The depression of any key associated with an order wire operates the corresponding relay by completing its circuit through springs 6 and 9, lighting the lamps associated with corresponding keys at all other A positions. These lamps therefore serve as busy signals. Key h at the B office is so connected that if for any reason a B operator is unable to attend to an incoming call she may connect the line with a source of rapidly varying current which will cause a distinctive hum to be heard in the receiver of the A operator.

RINGING AND LISTENING KEY.

William W. Dean, Chicago, Ill., patents (No. 836,067; dated November 13th, 1906; filed June 20th, 1902; serial No. 112,436) and assigns to the Kellogg Switchboard & Supply Company, Chicago, Ill., an operator's ringing and listening key.

In this patent are described methods of forming and assembling the parts of the key of the two-way ringing and listening type Among the novel features covered are the methods of providing for lost motion between the two members of the key lever, the construction of a stop to limit the extent of the vibration of the lower member of the key lever, the method of fastening springs in position, and a form of construction by which the friction between the springs and movable member is reduced. This is accomplished by off-setting the rubbing surfaces of the two springs, preferably by cutting away the ends on opposite edges, so as to leave only the off-set narrow portions in contact with the rubbing surface on the key lever. This rubbing surface is furnished by two small rolls of insulating material, which are so mounted that they may freely revolve in opposite directions. The framework of this key is so constructed that all working parts may be fastened to it from the side.

OUR '07 CATALOGUE SENT ON REQUEST

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE—1,000 Kellogg magneto telephones; Viaduct Mfg. Co. ringers; Wabash Cabinet Company's back boards and battery boxes. Good condition, almost new. Will sell singly or in lots. For particulars, write Kinloch Telephone Company, C. W. Shands, Purchasing Agent, St. Louis, Missouri. 755

TELEPHONE PLANT FOR SALE—New, up-to-date system consisting of two exchanges, 250 subscribers, thirty miles of toll lines, reaches six towns. Fine independent long distance connections. Located in Ohio. No competition. Splendid opportunity for right man. Owner's only reason for selling is inability to give personal attention to management. Address, Box 782, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 782

FOR SALE—Cheap; 100 telephone instruments, all warranted in good condition and to work. Address Melendy Telephone Co., So. Londonderry, Vt. 779

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

WANTED—A man with three years' experience as switchboard installer and four years as Superintendent of Construction, wants a position as Manager or wire chief of a common battery plant. At present employed as installer but is married and desires a local position. West or northwest preferred. Address Box 774, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 774

WANTED---Continued

WANTED—A telephone manufacturing engineer and manager, to take charge and promote a small concern. A thoroughly capable man is required. Address, Box 777, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 777

WANTED—Position by married man of 26 as manager of common battery exchange in a town of about 5,000 or more. Have built and managed complete exchanges. Salary reasonable. Address Box 778, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 778

WANTED—Superintendent of Construction; permanent position to one capable; married man preferred. State if union or non-union, salary expected, experience, etc. Position located in West Virginia. Address Box 781, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 781

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

THE STROMBERG-CARLSON MAP DISPLAY AT THE CHICAGO ELECTRICAL SHOW.

AT the Chicago Electrical Show one of the features which attracted a great deal of attention and excited much favorable comment was a large illuminated map, shown by the Stromberg-Carlson Telephone Manufacturing Company, of Rochester, N. Y., and Chicago, Ill. This map, as is made evident by the illustration presented upon this page, represented the entire United States, being drawn to a scale which made it nearly fill a large board 9 feet 6 inches by 15 feet in height and breadth respectively.

Every city in which is installed a Stromberg-Carlson telephone exchange was represented by a lamp. Three sizes of lamps and three different colors were used; the large white lamps, 21 in number, representing the home and branch offices of the company; the smaller white lamps, of which 1,775 were used, represented the generator call exchanges; large red lamps represented the large multiple or city exchanges, and the smaller red ones represented central energy systems of smaller capacity. No less than 317 red lamps were in place. All these lights remained illuminated throughout the exposition, making a display which was a very interesting and attractive sight. It formed an exceedingly strong object lesson of the growth and importance of the Independent companies. Among the many other interesting features of this company's exhibit was a 10,800-line section of a common battery switchboard, and other apparatus which gave a comprehensive idea of the various classes of equipment manufactured by the company.

Exhibit of the Stromberg-Carlson Telephone Manufacturing Company at the Chicago Electrical Exposition, Showing Large Illuminated Map.

THE CENTRAL TELEPHONE & ELECTRIC CO. of St. Louis, Mo., and Dallas, Texas, has just shipped two carloads of construction material to be used by the Municipal Telephone Plant, Edmonton, Alberta Province, Canada; also two 100 drop switchboards and complete equipment for exchanges in Mexico. Shipment of 35 cable terminals to Brazil on one order, and four other orders for Brazilian points for Becker cable terminals and other special protective devices show the foreign demand for these products. The company has one order for over fifty terminal heads to be shipped to an operating exchange in Texas, and reports that its protector department, as well as other departments, are all working over time to keep up with the orders.

THE BLAKE SIGNAL & MFG. COMPANY, 246 Summer Street, Boston, Mass., is receiving orders for its insulated staples and compressed cleats in constantly increasing numbers from telephone companies. The advantages of these supports for wiring seem to have been thoroughly demonstrated. The insulated staples provide an especially satisfactory means of securing wires to woodwork, as the insulation affords a protection to the wire which prevents interruptions due to grounds and short circuits. The broad contact surface between the insulating covering and the wire prevents the breaking of the conductor, as is likely to occur with staples of the ordinary type when carelessly driven. The compressed cleats are best suited to conditions which obtain when wiring is run over plaster. As these cleats obtain an especially firm grip upon the wire they lead to economies in the actual work of running connections, as they can be easily set up at considerable distance apart, and will hold the wire firmly without any slack. The intermediate cleats can then be quickly placed. They are so strongly made that they do not readily break under the pressure of the screw, as do ordinary porcelain cleats. The company will send full information upon receipt of a request.

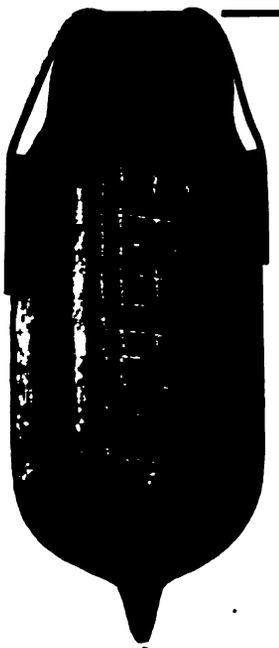
FRANK B. COOK, 246 West Lake street, Chicago, Ill., calls attention to the fact that when the Cook self-welding wire joint is used in making connections between sections of line wire there is no danger of corrosion, as moisture cannot penetrate to the wire. This joint is so formed that the act of twisting draws the sleeve into the recess between the wires, and stretches it absolutely tight around both wires, making a firm joint with good electrical contact over the entire circumference. He has issued a circular showing several views of this joint as applied, which make these points evident, and will be pleased to send this information to interested parties.

THE MOUNTAIN STATE ELECTRICAL COMPANY, Wheeling, West Va., in its booklet AL-2 describes the Poole lock-out system, which is becoming very extensively used on four-party lines. This instrument operates on a very simple principle, and affords an effective means of preventing subscribers from breaking in upon a busy line. The doing away with the listening in troubles which make it possible to secure secrecy and avoid such faults as failure to ring the right person owing to the removal of another telephone on the line, is an important advantage in giving party line service. The company makes several interesting statements in regard to this class of service, including estimates of cost which will be sent to interested persons upon receipt of a request.

THE D. & T. ANCHOR COMPANY, La Crosse, Wis., calls attention to the fact that the D. & T. anchors can be driven without difficulty in frozen ground. This fact has been practically demonstrated, so that telephone companies who wish to brace their lines in winter would appear to have an economical means of carrying on this work at their disposal. The company has prepared some interesting information upon various types of anchors, explaining the construction which gives them good holding power owing to the fact that they grip the solid ground.

THE NORTON-SYSTEM TELEPHONE COMPANY, Toronto, Canada, has just published in its Bulletin No. 5 a description of some of the interior systems which it recommends. This bulletin shows

Digitized by Google



¶ On March 28th, 1906, the Primary Examiner, Division 16, United States Patent Office, in handing down a decision validating the V-B IRON WIRE BALLAST APPLICATIONS, announced:

"The ballast makes it possible to insert into each line a small device in no manner made especially for that line, but which automatically accommodates itself to that line, and which can be taken out and used on any other line of different resistance and will automatically balance this other line.

There is no selection of a certain device for a certain line necessary.

There is no rough approximation, but it is as though each line had been carefully tested and individually ballasted. More than this, the device **automatically** provides against a sudden short circuit on the line. With so many apparent advantages resulting from the adoption of the **BALLAST**, it would seem reasonable that telephone engineers would have availed themselves of the device. They seem rather to have adopted **more expensive, more complicated and less effective** means to reach the same end."

¶ On October 6, 1906, the Primary Examiner made the following important decision:

"All these patents (quoted in decision) serve but to show that this trouble (burning out of line lamps) has been long recognized and many attempts in many ways have been made to overcome it; that notwithstanding for a quarter of a century it was known that fine iron wire increased its resistance with a rise of current, **no one ever did it before.**

"It has not been denied but that the device is simple and a material improvement in telephone systems. The arrangement is new, accomplishes a useful result in a new way, and **advances the telephone system a step nearer its ultimate perfection.**"

¶ The services of the engineering department of THE VOTE-BERGER COMPANY, LA CROSSE, WISCONSIN, sole owners of the V-B iron wire ballast applications, are at your command. A line from you addressed to Department C will bring you full information concerning the various applications of the iron wire ballasts.

¶ If you contemplate purchasing a COMMON BATTERY switchboard this season, do not delay sending in your plans or specifications. If agreeable to you, sales engineers of THE VOTE-BERGER COMPANY will call upon you at your convenience. The sales engineers will not take up your time unless you are desirous of meeting them.

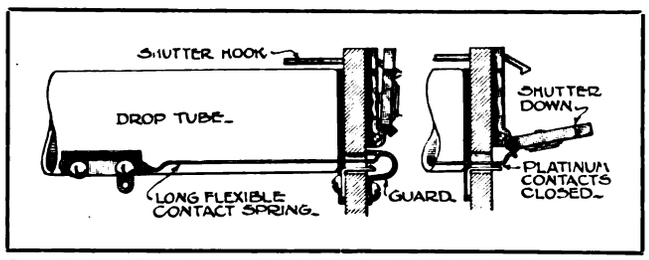
the circuits for such systems and also apparatus, including telephones, switches, annunciators, etc., which are needed in constructing them. The company will be pleased to send this bulletin or any information concerning the several classes of telephone apparatus in which it deals to all interested persons.

SOME DETAILS OF DEAN EXPRESS APPARATUS.

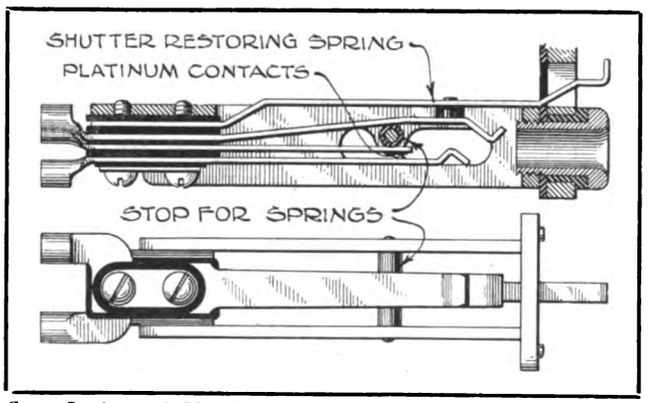
IT IS by attention to details that the manufacturers of telephone apparatus are eliminating the difficulties which formerly led to some of the most annoying troubles which vexed the operating men.

In a booklet devoted to a description of its new express type switchboards, the Dean Electric Co., of Elyria, Ohio, calls attention to two interesting points in the construction of its apparatus which are illustrated by the accompanying cuts. The one in the upper portion of this page shows the mechanism of the night alarm contact associated with the drop. It consists of a long flexible German silver spring mounted on the side of the drop tube with its free end projecting in front of the mounting strip as shown. This spring is so constructed and tempered as to have unusual flexibility so that when forced downward by the action of the shutter, as shown at the right hand side of the sketch, a positive contact may be assured. At the same time the resiliency of the spring is sufficient to carry it back into the normal position as soon as the shutter is restored and to insure its remaining in position without the necessity of frequent adjustment. Both of the night alarm contact points are of platinum and are located in plain view on the front of the switchboard. A guard is mounted in such a way as to protect them from mechanical injury.



Drop Used in Dean Express Board, Showing Visible Night Alarm Contacts.

The jack which is shown at the bottom of the page is made with a rigid steel frame and has heavy German silver springs. Normally the spring associated with the drop is connected with the line springs through platinum contacts. The springs when in normal position rest upon an insulated stop. The object of this device is to make it possible to maintain a heavy initial tension in the springs and at the same time keep them in absolute alignment with the plug hole in the jack. The shutter restoring spring is entirely insulated from the remainder of the mechanism. It is not controlled directly by the plug, but by the operation of the sleeve spring in the jack, to which it is attached by an insulating bushing. The end of this restoring spring is protected by the same guard which serves as a protection for the night alarm contacts. The jack is fastened to the mounting strip by its threaded sleeve. This construction allows it to be readily removed and replaced with the aid of a friction wrench.



Cross Section and Plan Drawings of a Jack, Showing Insulated Stop Upon Which Springs Rest When in Normal Position.

THE STERLING ELECTRIC COMPANY, Lafayette, Ind., has prepared an interesting card entitled "Do you know how to use a telephone?" It is illustrated with two photographs showing respectively the right and wrong ways. Of course the instrument shown is the Sterling. Telephone managers may obtain copies by writing to the company.

THE OLIVER MANUFACTURING COMPANY, 424 Library street, Philadelphia, Pa., has introduced in its new "Flexiphone" a telephone holder, which represents an important improvement in the arrangement of the balancing mechanism. The telephone stand is held in a vertical position, and automatically balanced at all times, and yet so delicate is the arrangement that no appreciable effort is needed to move the telephone to any location within the range of the arm. Connections to the transmitter and receiver are made through the arm, so that there is no annoyance from the cord, as is found when the ordinary desk telephone is used. The company will send full descriptions if asked to do so.

THE LEEDS & NORTHRUP COMPANY, 4901 Stenton avenue, Philadelphia, Pa., is calling especial attention at the present time to its varied line of non-portable resistance boxes and resistance measuring apparatus. This line of material is especially well fitted for certain classes of practical telephone work. One large telephone company to which the company has sold this material has repeated its orders many times within the past two or three years, showing apparently that good satisfaction has been obtained. The company will send out general information concerning these resistance boxes, or advice as to the kind of apparatus especially suited to any particular requirements, upon receipt of a request from the manager of a telephone company.

THE CENTURY TELEPHONE CONSTRUCTION COMPANY, 332 Ellicott street, Buffalo, N. Y., has introduced an improvement in its well-known celluloid markers for Independent telephone transmitters. It will be recalled that these consist of a small fan-shaped piece of celluloid, with a circular opening at the smaller end, through which the transmitter mouthpiece may be inserted, holding it in place. Upon the wider portion of the card is printed the Independent shield, and the words "Use this 'phone for long distance." The object, of course, is to keep a constant reminder before the subscriber who has both Independent and Bell telephones. The recent improvement consists in outlining just below the shield a small space in which the celluloid is slightly roughened, so that the telephone number may be written in.

THE COMMERCIAL ELECTRIC SUPPLY COMPANY, Fifteenth street, St. Louis, Mo., issues for the benefit of those customers who have occasion to make estimates a quarterly net price list. This list covers line construction lumber, plain and galvanized hardware, and telephone wires and cables. Prices are up to date at the time of issue. Managers and superintendents of construction can have their names put on the mailing list on application.

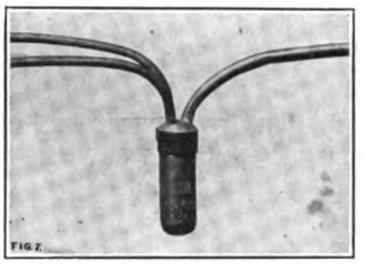
A MONEY SAVER



A MONEY SAVER

YOUR MONEY

will earn more in direct proportion to the wisdom of your investment of it.

If you could splice your cables better and for less money, you would do it? It would be a wise move to adopt a device that would accomplish this result for you. A good investment.

If your regular lineman could make a better splice, absolutely watertight and airtight, you would like to let him do it? You would welcome the chance to buy a device that would enable you to get away from the heavy cost of horizontal splices.

When "shooting trouble" you would like to get away from the necessity of tearing open your horizontal splices that cost you so much money and will cost you nearly as much to repair?

HOW TO INCREASE IT

Let us send you descriptive matter of the Hargis Cable Splicing Joint shown above. Your regular lineman can make a better splice, quicker, at much less cost than an expert cable splicer can make a horizontal wiped joint. This will increase your money. By using the Hargis Cable Splicing Joint you save cable; you save labor; you save money; you can always get at your pairs without spoiling your splice when "shooting trouble."

It will pay you to write us for descriptive matter.

THE WEEK'S MESSAGES

NEW COMPANIES.

HOBART, ARK.—The Big Elk Valley Telephone Company has been incorporated with a capital stock of $25,000.

LADOGA, IND.—Articles of incorporation have been filed by the Parkersburg Telephone Company. It has an authorized capital stock of $2,000 and the incorporators are D. S. Armstrong, J. I. Flanagan, Henry Fall, J. M. Nicholas, Arthur Nicholas, James Akers and others.

BLUFF CREEK, IA.—The Bluff Creek Telephone Company No. 9 has been organized with J. F. Hohl as president and I. R. Cox, secretary and treasurer. Connections will be made with Eddyville.

CARLYLE, KAN.—A rural telephone company, whose object it is to build lines to connect with the local exchange at Carlyle, has been organized by the farmers east of Carlyle. Among those interested in the proposition are W. F. Woods, J. B. Howell, H. Longshore, J. D. Christian, A. M. Dunlap, S. P. and J. E. Ryler. Construction of the line will be commenced at once.

McPHERSON, KAS.—The McPherson Rural Telephone Company has been organized with a capital stock of $5,000, and will include some sixteen rural lines. The officers are: C. W. Yowell, president; C. C. Mathes, vice president: T. M. Wallace, secretary; Jas. Poulson, treasurer.

HUSTONVILLE, KY.—Articles of incorporation have been filed by the Hustonville & Liberty Telephone Company. The capital stock is placed at $750, and the incorporators are Messrs. Humphrey and Young, of Liberty.

MONROE, ME.—The Monroe & Brooks Telephone Company, with a capital stock of $10,000, has been incorporated and the following officers elected: President, N. E. Webber; treasurer, H. Tibbetts, Monroe.

ST. CLOUD, MINN.—A farmers' telephone company, whose intention it is to build a line in the direction of Duelm, has been organized by the farmers east of St. Cloud. Among those interested in the enterprise are George Reis, John Curry, S. Brommenschenkle, H. Stirkamp, Bert Sawyer, Frank Bemar and Wm. Goedke.

REEDS, MO.—A new Independent telephone company, to be known as the Reeds Telephone Company, has been organized at Reeds, Mo. It will be operated along the lines of a mutual company and connections will be made with the Home Company of Carthage. The following officers were elected: President, H. R. Shue; secretary, C. B. Hood; treasurer, Harry Palmer.

MINEOLA, NEB.—Articles of incorporation have been filed by the Mineola Telephone Company. The capital stock is placed at $5,000, and the incorporators are Frank Oberle, I. D. Henry, Geo. Tomlinson, C. W. Morgan, W. F. Newman and others.

SMARTVILLE, NEB.—The Johnson Telephone Company, of Smartville, has been incorporated with a capital stock of $3,500. Among the incorporators may be mentioned George Sandusky, Frank Sack, Thos. Lempka, William Johns, Kirk Rose, Henry Hintz, Hy. Schumann, Jas. Murphy and David Bowen.

CALDWELL, O.—The Fulda Telephone Company, of Fulda, P. O. address Caldwell, O., has been incorporated with a capital stock of $750. J. M. Hehman and others are among the incorporators.

COLUMBUS GROVE, O.—The Columbus Grove Mutual Telephone Company has been organized by R. B. Good, W. H. Eversole, I. E. Bogart, J. T. Stoner and Jesse Amstotz.

FARGO, OKLA.—Articles of incorporation have been filed by the Fargo-Harmon Telephone Company, of Fargo. It has an authorized capital stock of $1,500, and the incorporators are G. W. Bailey, C. A. Stromberg, of Fargo, and others.

MIDDLETON, OKLA.—Articles of incorporation have been filed by the Middleton Grain Line Telephone Company. It has an authorized capital stock of $300, and the incorporators are B. F. McCutcheon, of Middleton, A. T. Cole and David Sherbon, of Peckham.

MUTUAL, OKLA.—The Farmers' & Merchants' Telephone Company, of Mutual, has been incorporated with a capital stock of $4,988. Among the incorporators are A. Huffman and Louis Morgan, of Mutual; G. C. Harper, of Moscow; Jacob Feathergill, of Persimmon.

JACKSON, TENN.—An Independent telephone company is to be formed at Jackson, Tenn., whose intention it is to construct a $225,000 exchange. A franchise has been granted to N. D. Smith, of Jackson, and the company is to be owned and controlled by local capitalists. It is proposed to install a thoroughly modern system, the company owning its own buildings. Wires in the business section are to be placed in conduits.

UVALDE, TEXAS.—The Uvalde & San Antonio Telephone Company has been incorporated with a capital stock of $10,000.

SALT LAKE CITY, UTAH.—The Utah, Nevada and Idaho Telephone Company has been incorporated with a capital stock of $200,000.

ONTARIO, VA.—Articles of incorporation have been filed by the Ontario Telephone Company. It has a capital stock of $5,000 and the incorporators are W. E. Bailey, Keysville, Va.; C. A. Osborne, R. H. Wilson, H. C. Henry and others.

ROSENDALE, WIS.—Articles of incorporation have been filed by the Rosendale Telephone Company. The capital stock is placed at $5,000, and F. I. Pinch, R. V. Pinch and I. W. Pinch are among the incorporators.

FORT SASKATCHEWAN, ALB., CAN.—The town council has decided to at once install a central energy telephone system which will be conducted under municipal ownership. Connection with the long distance lines now being built by the government will be made at Lloydminster. Address Mayor Daniels.

FRANCHISES.

CRESTED BUTTE, COL.—Application for a franchise to construct and operate a telephone system at Crested Butte has been made by the Crested Butte Telephone Company.

AVISTON, ILL.—The People's Telephone Company has been granted a franchise at Aviston. It is the company's intention to construct lines from this point to Trenton, where connection will be made with the Kinloch Long Distance Company for long distance service. The company has also been granted a franchise at Germantown, Ill., and work on its system will be commenced at once.

HELENA, MONT.—A request has been made by the Montana Independent Telephone Company of Butte, that the city council instruct the city engineer to designate certain streets and alleys in which it may install a telephone system.

AUBURN, NEB.—The city council of Auburn has granted a twenty-five-year franchise to the Auburn Mutual Telephone Company.

SCIO, ORE.—A franchise to construct a telephone system from Scio to Stayton has been granted the Scio Stayton Mutual Telephone Company.

STERLING, PA.—The Smartville Telephone Company has applied for a telephone franchise at Sterling.

MANTI, UTAH.—A franchise has been granted to the Southern Utah Telephone Company to construct lines and establish an exchange at Manti, Utah. Lines are to be built throughout the county, and connection made with the Independent line at Payson.

PAYSON, UTAH.—A franchise to construct and maintain telephone lines along the county line from Payson to the county line between Utah and Joab county has been granted to C. A. Watson and C. C. Adams, trustees for the Southern Utah Independent Telephone Company, hereafter to be incorporated.

FINANCIAL.

MIDDLETON, IDAHO.—At a recent meeting of the Star Independent Telephone Company the capital stock was increased from $10,000 to $25,000. It was also decided to install a new switchboard and otherwise improve its system.

ATWOOD, ILL.—The capital stock of the Atwood Mutual Telephone Company has been increased from $9,000 to $12,000.

CARMI, ILL.—It is the intention of the White County Telephone Company to increase its capital stock from $9,000 to $25,000 for the purpose of improving its system.

CARTHAGE, ILL.—The Mississippi Valley Telephone Company, Carthage, has increased its capital stock from $50,000 to $100,000.

WINCHESTER, IND.—It is the intention of the Farmland Telephone Company to increase its capital stock from $3,950 to $12,000, and also to pay in the future an annual dividend of 8 per cent.

BENZONIA, MICH.—A six per cent. telephone dividend has been declared by the Benzie County Telephone Company.

GRAND LEDGE, MICH.—The Grand Ledge Telephone Company has declared a three per cent. semi-annual dividend. The company guarantees a six per cent. dividend this year, and an eight per cent. dividend next year.

HOMER, MINN.—A cash dividend of 6 per cent has been declared by the Homer Telephone Company.

NEW RICHLAND, MINN.—Five thousand dollars have been added to the capital stock of the New Richland Telephone Company.

HIGHLAND MILLS, N. Y.—The Highland Mills Telephone Company, which now has a capital stock of $40,000, equally divided between preferred and common stock, expects to increase its common stock to $55,000.

GERMANTOWN, O.—The Germantown Independent Telephone Company has increased its capital stock from $10,000 to $20,000.

WOODSFIELD, O.—The Woodsfield Telephone Company has increased its capital stock from $50,000 to $60,000.

LOYALSOCK, PA.—The Loyalsock Telephone Company has declared the regular dividend of 6 per cent. on all stock issued prior to January 3, 1906, and 3 per cent. on stock issued prior to July 30, 1906.

SHICKSHINNY, PA.—An annual dividend of 5 per cent. has been declared by the Farmers' Telephone & Supply Company.

BELMONT, W. VA.—The usual semi-annual three per cent. dividend, payable February 5, has been declared by the Belmont Telephone Company.

ARCADIA, WIS.—The Western Wisconsin Telephone Company has increased its capital stock from $65,000 to $75,000.

THE WEEK'S MESSAGES

OCONOMOWOC, WIS.—At the annual meeting of the Badger Telephone Company it was voted to increase the capital stock from $5,000 to $25,000.

SPARTA, WIS.—A six per cent. dividend has been paid by the Monroe County Telephone Company.

UNION GROVE, WIS.—The capital stock of the Union Grove Telephone Company has been increased from $5,000 to $15,000, and the increase in capital will be used to improve the company's plant.

WAUSAU, WIS.—The Marathon County Telephone Company has announced its intention of declaring a five per cent dividend after May 1.

MELITA, MAN., CAN.—The Melita-Arthur Telephone Company has declared a dividend of 30 per cent. for the past year. It is the intention of the company to build many new lines.

COMBINATIONS.

WARSAW, N. Y.—The Warsaw Home Telephone Company has acquired the plant of the Wyoming Telephone Company, which has exchanges at Wyoming, Dale and Linden.

ELECTIONS.

SULPHUR SPRINGS, IND.—The Sulphur Springs Co-operative Telephone Company has elected the following officers: President, Mark Modlin; secretary, Luther Shively; treasurer, Jas. Ball.

MARSHALLTOWN, IA.—The following officers have been elected by the West Main Street Mutual Telephone Company: J. W. Carson, president; L. Oehlsen, vice-president; H. H. Shumway, secretary and treasurer.

LEXINGTON, KY.—At a meeting of the stockholders of the Fayette Home Telephone Company held at Lexington recently the following officers were elected: Geo. S. Shanklin, president; J. T. Shelby, vice-president; Chas. Kerr, secretary; J. W. Porter, treasurer.

BLUE SPRINGS, NEB.—The Gage County Independent Telephone Company has elected A. R. Morris, president; A. R. Patton, secretary, A. H. Krauss, treasurer.

ATHENS, O.—The Athens County Home Telephone Company has elected W. E. Moler, president; G. W. Duffee, vice-president; A. F. Holmes, treasurer; W. E. Peters, secretary; C. L. Jones, general manager.

GUYSVILLE, O.—The following officers have been elected by the Guysville Telephone Company: I. Brewer, president; L. Finsterwald; vice-president; A. B. Saunders, secretary; John F. Starkey, treasurer.

ZANESVILLE, OHIO.—At a recent meeting of the stockholders of the Zanesville Telephone Company the following officers and directors were elected: C. Y. McVey, president; S. M. Granger, vice president; J. B. Rhodes, secretary and general manager; H. B. Taylor, treasurer. Directors: J. S. Brailey, Jr., J. B. Hoge, W. L. Cary, Jr., C. Y. McVey, A. S. Hillhouse, J. B. Rhodes, S. M. Granger, C. A. Potwin and H. A. Sharpe.

PERSONAL.

FRED BUTTERFIELD has been elected secretary of the Industry Mutual Telephone Company, of Industry, Ill.

A. P. HARRISON, heretofore chief electrician of the Cumberland Telephone Company at Nashville, Tenn., has been appointed chief supervisor of electrical equipment of the whole system. The employes of his department presented him with a handsome monogram signet ring and a silver-cased clothes brush when his appointment was announced.

MISCELLANEOUS.

ODEBOLT, IA.—The exchange of the Farmers' Telephone Company was destroyed during a recent fire at Odebolt.

ABBYVILLE, KAN.—The Abbyville Telephone Exchange has been purchased from Frank Birket by the Pekin Co-operative Telephone Company.

ALINE, OKLA.—The Oklahoma Central Telephone Company, whose lines run from Aline to Cleo, has passed into the hands of George Hamacher, A. B. Fluke and others. It is the intention of the new owners to build a number of new lines.

CARMEN, OKLA.—A permanent county organization of all the rural telephone companies in Wood county is being considered. Among the companies which will enter into the organization are the Union Telephone Company, of Ingersol; Byron Telephone Company, of Byron; Driftwood Telephone Company, Capron; Cherokee Telephone Company, Cherokee, and the Carmen Rural Telephone Company.

CAMERON, W. VA.—Connections are to be made by the Cameron Telephone Company with the National Telephone Company at Wheeling.

NORFOLK, VA.—Among the recommendations that have been made to the Finance Committee of the Norfolk City Council is an appropriation of $12,000 for a new police telephone and signal system.

VIRDEN, MAN., CAN.—The municipality of Wallace has applied to the provincial government for estimates of cost of the construction of a municipal owned telephone system. Address A. C. MacDougall, Virden, Man.

New Construction in the Field

MONROE, ARK.—A new telephone line from Monroe to Brinkley is being constructed by J. W. Carter, of Monroe, and Thomas Monroe, of Brinkley.

RECTOR, ARK.—The lines of the Local Telephone Company are being extended all over the eastern district of Clay county, and it is the company's intention to build lines to Nimmons and to Kennett, Mo., and over the greater part of Dunklin county.

BREESE, ILL.—The People's Telephone Company is installing a first-class plant at Breese.

HUNTINGBURG, IND.—Many new lines are being built by the Dubois County Telephone Company.

SIOUX CITY, IA.—The Cudahy Packing Company is building a private telephone line between Sioux City and South Omaha.

WAMEGO, KAN.—Among the improvements planned by the Wamego Telephone Company is the installation of a new switchboard.

CHASKA, MINN.—Among the improvements planned by the Norwood Young America Telephone Company is the installation of a new switchboard.

KANDIYOHI, MINN.—The Eastern Union Telephone Company expects to greatly improve and extend its system.

PRINCETON, MINN.—A new exchange is to be installed by the Rural Telephone Company.

CLINTON, MO.—Many extensions and improvements are under way by the Union Telephone Company.

DONIPHAN, MO.—The Mutual Telephone Company, which has recently refused connections with the Bell company at Doniphan, is about to install its system.

AUBURN, NEB.—The Auburn Telephone Company, which was recently granted a franchise at Auburn, contemplates the rebuilding of its entire system. A new building is to be erected, a new switchboard installed, and the plant made thoroughly up to date in all particulars.

RHYOLITE, NEV.—The Southern Nevada Consolidated Telegraph & Telephone Company contemplates the erection of a line from Rhyolite to Lee.

GREAT BEND, N. Y.—New lines are being erected by the Northeastern Telephone Company at Great Bend.

SANDY HILL, N. Y.—The Commercial Union Telephone Company has constructed a line from Sandy Hill to Fort Edward.

BUCYRUS, O.—In addition to extending its lines in the city of Bucyrus, it is the intention of the Bucyrus Telephone Company to build ten new rural lines. It is estimated that about seven thousand feet of cable will be strung.

LEIPSIC, O.—The Putnam County Telephone Company is making improvements in its system.

RAVENNA, O.—It is the intention of the Portage County Telephone Company to expend in the neighborhood of $20,000 in Ravenna for the improvement and extension of its system. An entirely new central office equipment will be installed and additional cables placed in many sections of the city.

PHILADELPHIA, PA.—To facilitate the handling of its freight business, it is reported that the Pennsylvania Railroad will very soon arrange for the installation of a telephone system between Wilmington and Washington.

WALTERBORO, S. C.—A new switchboard is being installed by the Colleton County Telephone Company, and other improvements in its system are planned.

POINT PLEASANT, W. VA.—A new four hundred and fifty line switchboard, which will necessitate using about three thousand feet of cable, is to be installed by the Point Pleasant Telephone Company. It is also the company's intention to construct a new toll line to connect with the Charleston Home Telephone Company, and to rebuild its toll line to Mason City.

CASCO, WIS.—It is the intention of the Casco and Brussels Telephone Company to make many improvements and extensions in its system at an early date.

SUPERIOR, WIS.—Many extensions are to made in the lines of the Peoples Telephone Company.

UNDERGROUND.

RENO, NEV.—The wires of the Reno Telephone Company are to be placed underground in the business section of Reno.

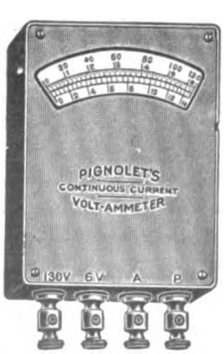
TO BE FOREWARNED IS TO BE FOREARMED



If you are not using a measuring instrument to test your lines, get one at once, as you will need it many times before the summer comes. It would be just as sensible for a grocer to try and sell sugar by guessing at its weight as it is for you to try to locate a fault in a line by the same method. PIGNOLET VOLT-AMMETERS are designed to give the best results required for testing purposes. They are not complicated nor do they require experts to operate them. Another point in their favor is their low cost. There is no instrument on the market which will give you as accurate results at anything near the price. Hadn't you better write for prices and further particulars By buying one now you will save its cost many times over before you have had it a year.
LOUIS M. PIGNOLET, Originator of the Voltmeter Habit
78 CORTLANDT ST., N. Y.

Quality Higher Than Price

¶ It's an easy matter to talk quality and price, but quite another to produce the goods to back it up.

¶ We have always put more faith and dollars into securing good materials and employing skillful and intelligent labor in the manufacture of our telephones than in advertising the fact, and the careful buyers are beginning to find it out.

¶ Prejudice and ignorance may hold the fort for a day, but merit and fair dealing in the end are invincible.

¶ We solicit your inquiries and an opportunity to quote prices and submit samples of our product.

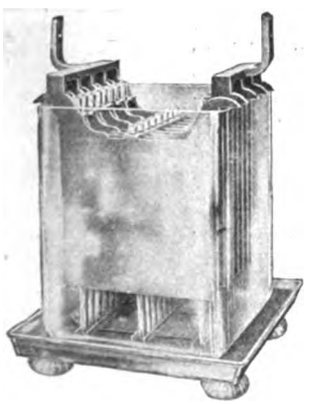
CLAIMS FULFILLED



Viewed from the standpoint of scientific theory, no other storage battery plate can compare, detail for detail, with the Gould Integral Plate. Many of the largest Telephone Companies in the United States have purchased Gould Storage Batteries on the *very apparent* merit of our battery. It is a most significant fact that in almost every such case *repeat orders* have followed the first test order. The Gould Battery has succeeded because it has made good our claims for its unusual merit and economy.

Write for our catalogues.

JUST A SUGGESTION

Take one of your busy 4-party lines and equip it with "POOLE" Lock-Outs. Leave it in service a month and then see how many of the four will stand a raise of $3.00 a year rather than go back to the old way. We know the answer, but we want your subscribers to impress on you the fact that the "POOLE" Lock-Out is a rate-raiser.

It won't cost you anything to try it, because we will loan you the Lock-Outs free and there is no other equipment required. Write today for our Booklet AL-2.

DEAN TELEPHONE APPARATUS

Magneto Switchboard Protection

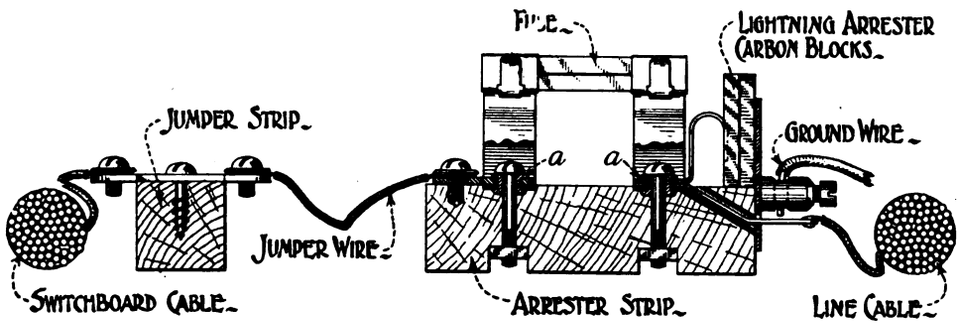

Diagram of a line wire connection through the new Dean arrester and cross connecting board.

The above diagram shows very clearly why our magneto switchboard arrester and cross connecting frame eliminate many troubles from your exchange circuits.

First: The circuit from the line cable to the switchboard cable is through a metallic path, not dependent on clamping of parts through wood or other insulating material. The line cable clips, the jumper wire fasteners and the ground spring are securely riveted to the fuse clamps by hollow rivets *a, a.*

Second: The fuses are securely clamped in a new type of spring clip which it is impossible to spread so as to spoil the tension.

Third: These spring clips are attached to the mounting by machine screws and nuts, the head of the screw being exposed so as to be accessible from the front side of the strip. The nut is held from turning by resting in a groove on the other side of the mounting strip.

Fourth: Large, serviceable jumper rings are provided. They are insulated by a tough enamel glazing.

Fifth: The arresters and jumper strips are made in units of ten pairs each and are mounted for use on a channel iron frame work.

Sixth: The carbons, micas and fuses are all of standard size, easily removed and replaced and the kind that are not conducive to trouble.

Seventh: All of the springs are made of the best grade German silver, and other parts of the same quality of material.

This new Dean arrester and cross connecting frame is a fitting companion to our new Express Type Switchboards.

If you are having trouble with your present equipment, let us know your requirements. Our prices might be of interest.

Our new folder No 6 describes in full our various types of Express Type Switchboards. A copy of this folder will be mailed free on request.

Stromberg-Carlson Telephone Mfg. Company

Rochester, N. Y. March 2, 1907.

TO THE EXCHANGE MANAGER AND TELEPHONE USER:

More telephone men will try "STROMBERG-CARLSON" Switchboard and Telephone Cords because our letter of February 23rd interested many.

Receiver and Desk Telephone Cords that will perform constant service satisfactorily are "STROMBERG-CARLSON" braided copper tinsel thread and green spun machine silk insulated cords.

We manufacture these cords in any lengths, equipped with a variety of standard terminals on either or both ends, and for use with all forms of telephones.

SPECIFICATION EACH CONDUCTOR.

First:- Sixteen (16) ends braided copper tinsel thread. Average breaking strength each thread not less than 24 ounces. The copper ribbon, .013" wide x .001" thick, shall be at least 98% pure copper laid flat upon a cotton thread.

Second:- Braiding #20 - 2 ply green cotton thread, 16 spindles, 1 thread. Average breaking strength each thread not less than 25 ounces; yardage per pound shall be 8400, and the twist not less than thirteen to the inch.

Third:- Braiding green spun machine silk 24 spindles 1 thread.
Average breaking strength each thread 48 ounces.
Yardage per ounce shall be not less than 570 nor more than 630.

Fourth:- External braiding over all conductors, green spun machine silk, 32 spindles 1 thread.

All materials used in "STROMBERG-CARLSON" Cords are purchased under our standard specifications that demand the best materials.

May we send you a few samples by next mail?

Yours very truly,

CL No.2. Stromberg-Carlson Tel. Mfg. Co.

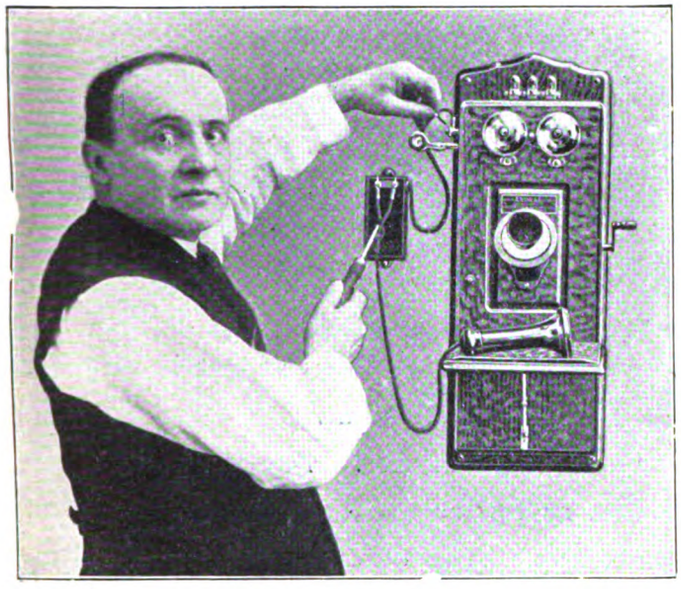
ANDRAE



Talks With the Trouble Man

For twenty-five years I have been in the working end of the telephone business. I have chased all kinds of troubles in all kinds of places. I have seen the development of the party line system with all of its new troubles and advantages to the telephone man. Many a time I have been sent out into the country to learn why a subscriber's bell did not ring and struggled in vain to locate the trouble, only to find that others on the line either had their receivers off the hook or took them down before the signal was finished. I have heard the operator grumble and the exchange manager swear, but never found any means of stopping the trouble made by "RUBBER-NECKS" until the development of the party line condenser.

These furnished the greatest comfort we had ever known and to-day there is no necessity for an exchange manager to worry about **receivers off the hook.** The day is not far distant when a party line telephone without a condenser will be as rare as the old "Blake Transmitter."

No Trick At All. **CONDENSERS**

Condensers can be installed on any telephone in **10 minutes' time with no tools but a screw-driver.** You simply disconnect the receiver cords and put the condenser cords in their place; then connect the receiver cords to the binding posts on the condenser and the job is done. Probably no piece of telephone apparatus has grown in favor with such rapidity as the Andrae Patented Iron Case Condensers. Telephone companies are adopting them all over the country, and letters are received daily with expressions of the greatest satisfaction and orders for more condensers. A 30 days' trial can be had **at our expense** with no strings to it.

99 W. WATER STREET
MILWAUKEE

LOOKING FOR TROUBLE?

Suppose you have a line in trouble—grounded or open. You don't know the exact location, but you send out a troubleman to hunt it up and clear it. It may take him an hour or a day. Meanwhile the subscriber is getting hot under the collar and saying things about telephones in general and yours in particular.

If you have a Pignolet voltmeter or volt-ammeter you can determine the approximate location and also get an idea of the nature of the trouble. With the information your troubleman can find the fault in jig time, and you will have prevented the subscriber kicking by giving him service at the earliest possible moment.

Does it pay to be informed? You ought to know.

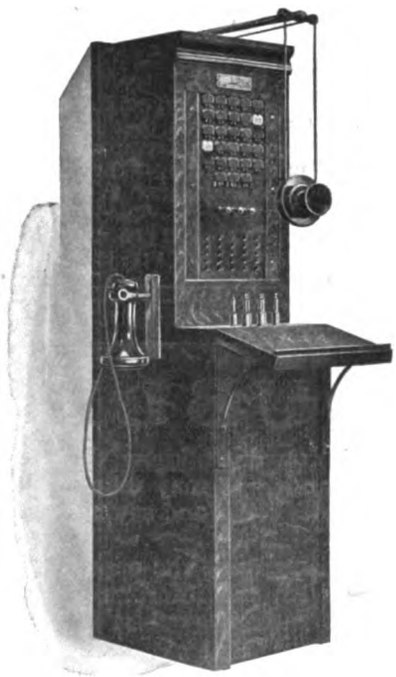
NORTH'S

WALL CABINET SWITCHBOARD

A NEW DESIGN

This Switchboard has capacity for fifty magneto lines. The cabinet is built for mounting on the wall in a manner similar to a telephone instrument.

Line drops and jacks—separate—put up in strips of five. Buy for your immediate needs only. Get a cabinet fully wired, with as few as five lines equipped. When you want to increase, buy a strip of drops and jacks and install them yourself. Simple and easy—screw the strips to the mounting frame and solder on the wires. Wired and equipped with three standard cord pairs.



Built with the same care and attention to details as the larger boards—apparatus the same standard parts.

Oak cabinet, kiln dried, hand polished. Back panel hinged in such a manner that when screwed to wall the entire front part of cabinet may swing around, admitting access to all parts.

The drops are very sensitive and free from cross talk---coils incased in soft iron shells—not tubes of sheet steel formed up, but solid Norway rods bored out. Mounted in banks of ten—apart from jacks.

The jacks also mounted in strips of ten and easily removed. Aluminum base, German silver springs and pure platinum contacts. They cut out both sides of drop and keep line balanced.

Roller bearing keys with German silver springs and platinum contacts.

If you expect to install a switchboard in the near future, write for further details and let us give you an estimate.

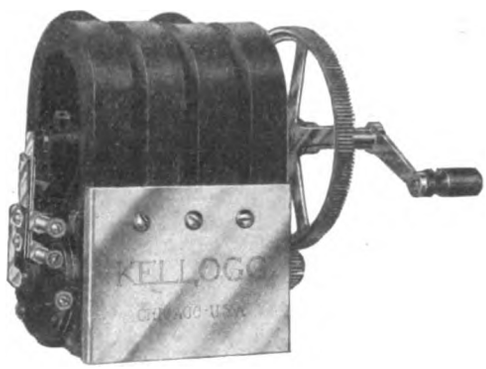
KELLOGG

TELEPHONE APPARATUS

KELLOGG COMPACT DRY CELL TYPE TELEPHONES

CONTAIN THE KELLOGG HAND GENERATOR



This Generator, No. 22, is as nearly perfect electrically and mechanically as it is possible to make. We claim for our 4-Bar Generator as great an efficiency and durability as any 5-Bar Generator of any other make. Our 3-Bar and 5-Bar Generators are strong in proportion. The armature is made of special soft Silicon iron. The winding is of best grade silk covered copper wire, wound smooth, without piling up at the ends. The Gear Wheels have cut gears and always run noiseless. The Pole pieces, end plates and field magnets are very accurately machined and so assembled as to give the greatest possible power and durability.

The Kellogg Generator will ring over the most heavily loaded lines used in telephone service.

Let our Department A furnish you with our Bulletins and prices on Magneto Apparatus. We solicit your correspondence.

No. 10 Protector—Sectional View.

Cook's No. 10 Protector

THE automatic heat coil test, which is absolutely necessary in Cook's No. 10 Protector, before a spring which has been operated can be reset, is only ONE desirable feature of this protector.

The heat cartridge isn't a WIRE coil—it can't burn out or short circuit. It has a METAL SHELL which will not burn up and start fire in the coils above it.

It has so MANY other splendid points that we'd like to have you write for some more information before ordering or specifying switchboard protectors.

Frank B. Cook.

MANUFACTURER,

238 West Lake Street, - - CHICAGO, ILL.

You Wouldn't Start a Horse Car Line

in this age of electric cars? Not if you wanted to make money out of the business of transportation.

Then why should you start a manual telephone exchange in this age of automatics, if you want to make money out of the telephone business?

The automatic system of telephony bears the same relation to the manual system that the electric car does to the horse car. It is the apotheosis of telephone development, as the electric car is of transportation development.

The automatic telephone system produces the best service more economically than indifferent service can be produced with manual equipment.

There is no more question as to the relative popularity of the automatic and manual telephone service where the two kinds are in competition than there is as to the relative popularity of the trolley car and the horse car.

And, as for the securities—the same comparison may be applied with the same results.

Our Automatic system has been adopted in the following cities:

REASONS WHY

YOU SHOULD INSTALL

THE CALCULAGRAPH

No. 7

(See "Reason Why" No. 8 next week)

IT INCREASES TOLL BUSINESS

Because subscribers are better satisfied with the service. Operators can devote the time formerly occupied in figuring and writing toll charge tickets to getting satisfactory and quick connection for patrons. Service is thus better when Calculagraphs are installed and subscribers are better satisfied with the service. If quick, satisfactory service can be given, subscribers will use the toll lines more.

VOLUME XV. SATURDAY, MARCH 2, 1907. NUMBER 9

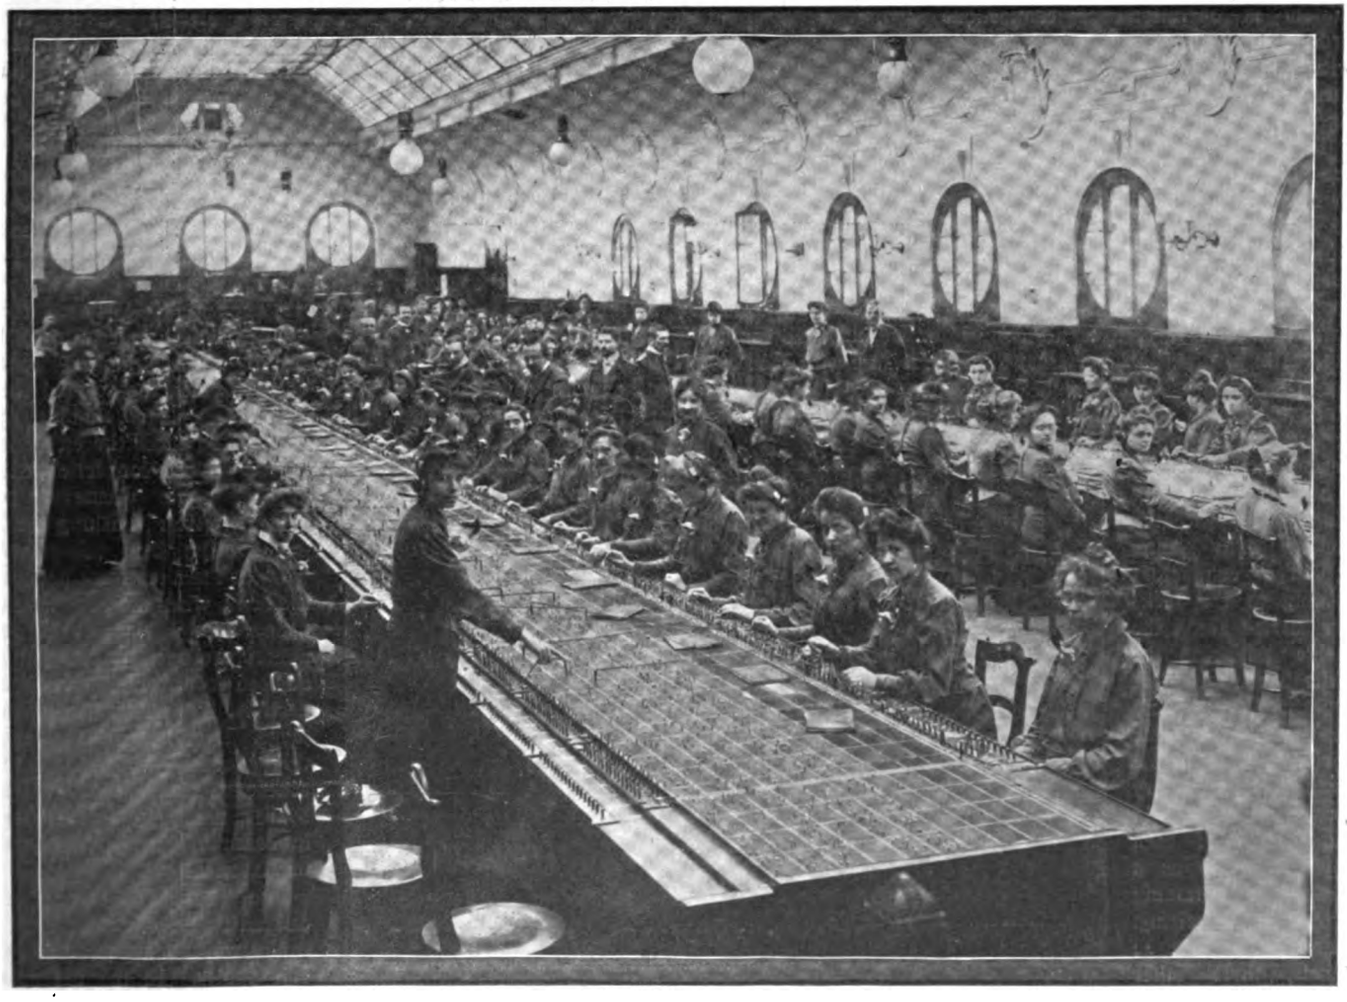
Berlin VI—A 24,000-Line Exchange

By Dr. Alfred Gradenwitz.

As stated in previous issues of this journal, the whole of the Berlin telephone service is being converted to the central energy system with automatic calling of the exchange and automatic disconnect signals at both ends of the connection.

The exchange Berlin VI, which was opened to public service a few months ago, is one of the largest telephone exchanges in the world, and when it was cut into service the conversion above referred to made an advance which produced a marked public impression. Whereas the exchanges of the cities of Breslau, Leipzig, Nuremberg and Charlottenburg, operated on the same system and which have been cut into service within a short time, have a capacity of 20,000 lines each, the new exchange Berlin VI is designed for 24,000 subscriber lines and 2,100 trunk lines. Of this large number of lines 18,000 subscribers' lines and about 1,200 trunk lines for incoming business, with a similar number of outgoing trunk lines are being used at the present moment.

The new exchange is situated in the western part of Berlin, in a special building adjoining the new Post Office in Körner-Strasse. The switchboards are installed in two large halls, next the roof of the building, situated beside one another and connected together by transversal wings. Below these halls are installed on an intermediary story about 3 meters in height the frames intended for the relays, the intermediate distributing frame, and also the big main distributing frame. The intermediate story further comprises in a special room the large central office storage battery. Beside the battery room there is situated the charging plant, comprising two direct current motor generator units (used in duplicate) in addition to a switchboard for controlling the circuits to the battery. In the same room is located the ringing generator unit, comprising a direct current motor coupled to an alternating current generator, which supplies the alternating current required for calling subscribers. Immediately beside the



One Wing of the Operating Room in the New Exchange at Berlin.

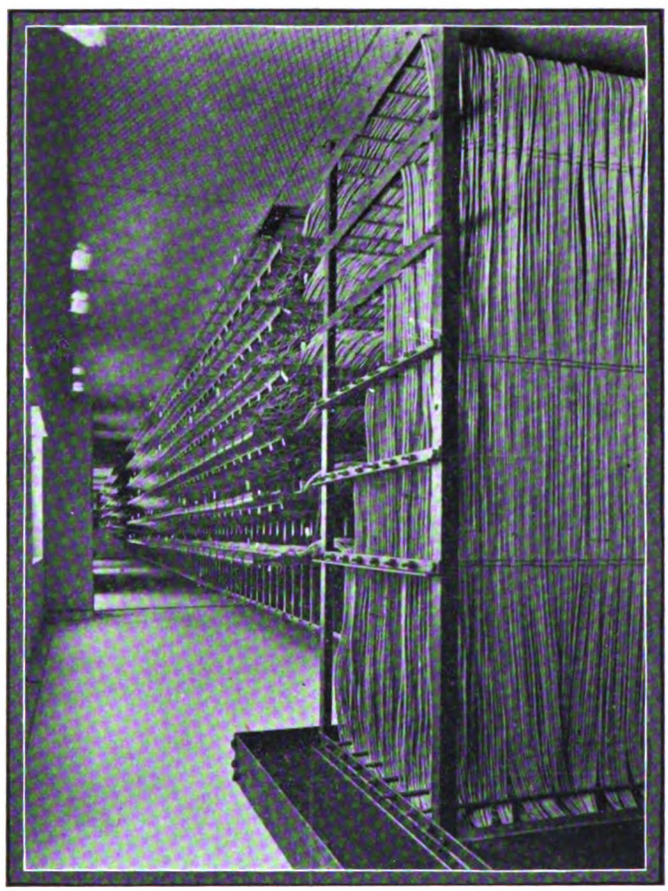
main distributing frame there is situated the wire chief's office, from which any disturbance in the service may be located. In the story situated below the intermediary story there are located the managing offices as well as cloak rooms and refreshment rooms for the male and female employees.

The switchboards are of the horizontal type which are used because they are asserted to possess the advantage of smaller space requirements. The arrangement of connections is such that only the two external circuit lines are used inside of the system, that is a two-wire multiple is used. This makes possible still further saving in space.

The two halls, each of which is about 15 meters in length and ten meters in breadth, at the present moment comprise 42 panels with 6 operating seats each. Of the 252 operators' positions 126 have been set apart for handling the subscribers' lines. The operators' positions reserved for subscribers on the flat-rate system each comprise 120 calling lamps, while those intended for subscribers on the measured service system contain 200 calling lamps. The 2,100 incoming trunk circuits, that is to say the lines connecting the exchange with the remaining telephone exchanges of the city of Berlin, are distributed among 126 operators' positions. About 1,000 outgoing trunk circuits, or, as they are called by the German engineers, "Starting exchange connecting lines" are at present in operation for connections ordered by subscribers to the exchange with subscribers to other exchanges; these are equipped with visual "busy" signals.

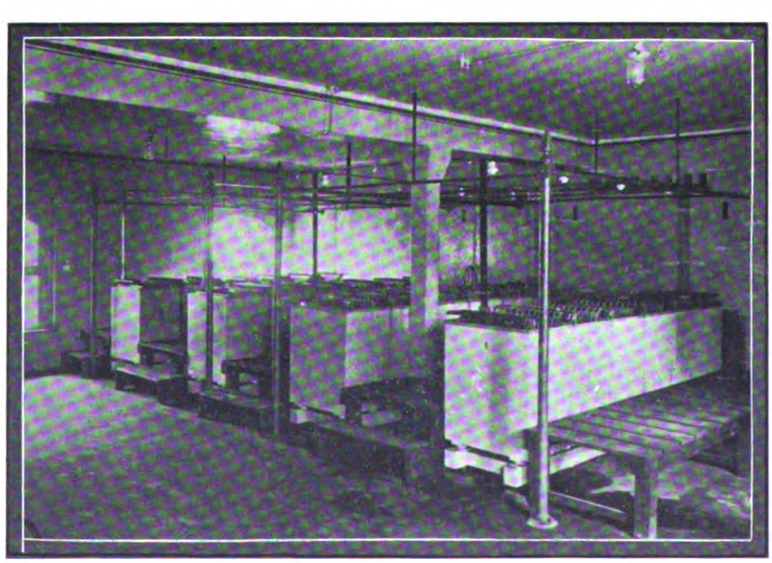


A View of the Mammoth Intermediate Distributing Frame, which is Exceptionally Well Lighted.

The individual switchboard sections are 2.16 meters in length and 1.40 meters in breadth. Their frames are made up of flat and angle iron, resting on the floor of the intermediary story. For handling any required connections, each operator's position in addition to the necessary calling lamps and corresponding answering jacks, has been equipped with 15 pairs of cords connected respectively to inquiry (answering) and connecting (calling) plugs, a supervisory lamp associated with each cord, and a set of keys for each cord. The lamps and plugs are combined in sets of ten each in composite hard rubber and metal strips, and are fitted beside one another, the corresponding plug being situated behind each lamp.

The conductors leading to the jacks are carried along the inside walls of the switchboard frames in the shape of 21 pair cables. A convenient corridor, accessible from the intermediary story, is reserved in the middle of each row of panels as a means of obtaining access to the wiring. Outside of these 42 panels, three other panels (called switching panels) will effect any connection between subscribers and the long-distance telephone exchange situated in Französische Str. These panels comprise four operating seats each, viz.: two on either side, and a multiple switchboard containing 8,000 jacks. Special official lines have been set apart for communication with the local and long distance exchanges.

Many methods of handling calls are in use in Europe. At this exchange the following description will illustrate the method on which the service is carried out, and give incidentally, by means of literal translations, an index to the most common forms of designating telephone apparatus in use by German engineers. As soon as the subscriber calling up the exchange takes his receiver off the hook, his calling (line) lamp at the exchange will be lighted. The operator answers the call by inserting the inquiry (answering) plug of any disengaged pair of strings (cords) into the inquiry (answering) jack situated immediately behind the lighted lamp, while placing the corresponding talking switch (listening key) in the inquiry (listening) position, when the calling (line) lamp will be extinguished. The subscriber then states the connection desired, and the operator, after inserting the other plug, known as the connecting (calling) plug, into the multiple switch jack of the desired subscriber calls him by throwing the key into calling (ringing) position. From this ringing position, the key, of its own accord, returns to its normal position when the desired connection will be obtained. The supervisory lamp enables the operator to check the existence of any desired connection, calling up again whenever required. After finishing their conversation both subscribers will put their receivers back on the hook, when the two "finish" (supervisory) signals will be lighted, the operator being thus advised to discontinue the connection by withdrawing the plugs. It will be observed that this process, in spite of the difference in types of switchboards, is the same as is used in common battery exchanges in America.



The Battery Room and Storage Battery Plant in the New Exchange "Berlin VI."

The subscribers' lines are carried to the exchange nearly exclusively underground in 250 pair cables. In the basement these are each subdivided into

The Texas Convention

THE best meeting the Texas Independent Telephone Association ever held was the one in the court house at Fort Worth on February 21st and 22d. Over seventy delegates were present from all over the State, representing about 8,000 circuit miles of toll line and 35,000 telephones. Mr. J. C. Casler, president of the association, was in the chair, and appointed Chas. F. Speed temporary secretary in the absence of C. A. Shock.

The president immediately appointed the following committees:

Nominations: Mr. Johnson, Corsicana; Mr. Roberts, Abilene; Mr. Chamberlin, Greenville; Mr. Emmer, Beaumont.

Ways and Means: Mr. Earle, Waco; Mr. Speed, Texarkana; Mr. Marrs, Dallas; Mr. Davenport, Hillsboro.

Constitutional: Mr. Conway, Beaumont; Mr. Mosely, Weatherford; Mr. Roberts, Abilene; Mr. Gould, Ennis.

Auditing: Mr. Macune, Sipe Springs; Mr. Armstrong, Weatherford; Mr. Smith, Weatherford.

Legislation: Mr. Earle, Waco; Mr. Martin, Llano; Mr. Mosely, Weatherford; Mr. Samuels, Fort Worth; Mr. Chamberlin, Greenville.

It was moved by J. B. Earle that the chair be ex-officio a member of each committee, and carried by vote of the members.

The legislative bills now in the House of Representatives were read and the secretary was instructed to have copies made for each member. The president was instructed to telegraph all absent members to come at once. The meeting then adjourned until 1:30 P. M.

J. C. Casler and J. B. Earle at the Texas Convention.

At the afternoon meeting the president introduced the Mayor of Fort Worth, the Hon. W. D. Harris, who welcomed the delegates and in his excellent address made a special point of the high service rendered by the Fort Worth Telephone Co. and paid a high tribute to the efficient management of the company by Mr. J. C. Casler. Sidney L. Samuels responded to the mayor's address.

The Committee on Ways and Means recommended that the by-laws be changed to make the dues to the association 2½ cents per telephone used and 2½ cents for each circuit mile of toll lines; manufacturers' dues, $12.50; individual membership dues, for employes of companies, $1 per year. It was further recommended that the association reimburse the delegates to the amount of their railroad fare to and from convention. After considerable discussion as to whether the dues as fixed would provide ample funds, it was decided to delay action until the members could give the matter proper thought. The Auditing Committee reported that it had examined the records of the secretary, found them to be correct and certified to the amount of cash in the treasury. The meeting adjourned at 4 P. M. to give the delegates an opportunity to see the exhibits of the manufacturers and prepare for the evening entertainment, which had been provided by the manufacturers and supply dealers represented in Texas.

At 7:30 P. M. seventy-five delegates met at the Exchange building of the Fort Worth Telephone Company and marched in a body to Greenwall's Theatre. After the play a banquet was given at the Delaware Hotel.

The ladies who had accompanied their husbands to Fort Worth were provided with special seats at the theatre and served with a luncheon at the Touraine Hotel. The manufacturers who acted as hosts at the entertainment were the Electric Appliance Company, Zinc Oil Pole Company, National Lumber Company, Woods Electric Company, North Electric Company, Wesco Supply Company, Hobson Electric Company, Stromberg-Carlson Manufacturing Company, National Carbon Company, Frank B. Cook, Central Telephone and Electric Company, and the Standard Underground Cable Company.

The delegates expressed themselves as highly pleased with the entertainment. Considerable favorable comment was made on the fact that no liquor of any kind was served by the hosts.

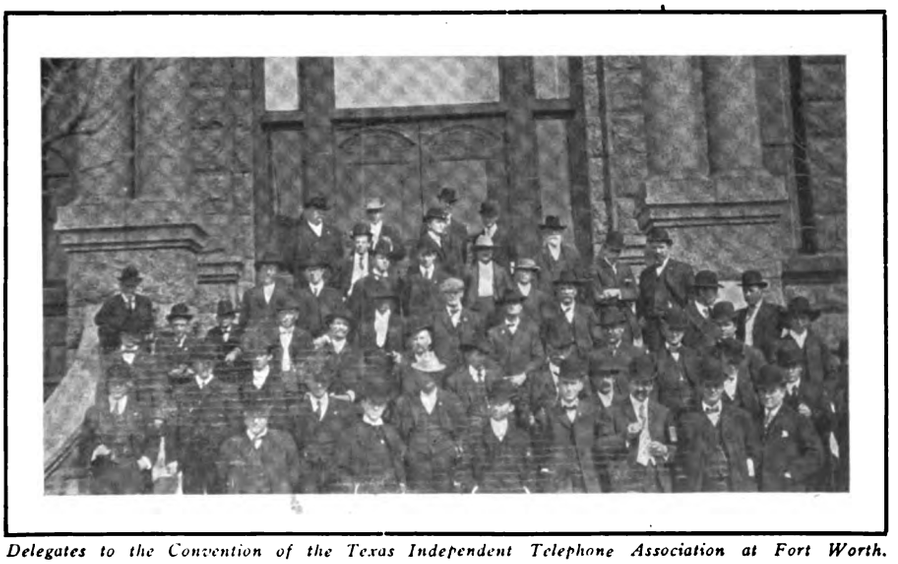
The early morning hours of Friday were taken up with a visit to the packing plants of Swift and Armour, a special car being provided by the Fort Worth Telephone Company. Upon returning to the hall the association went into executive session. The first subject discussed was that of permitting manufacturers' representatives who had holdings in telephone properties to be admitted to the executive session. This was decided in the affirmative, and the committee on legislation made a report which caused discussion until the noon hour, when adjournment was taken until 1:30 P. M.

The Committee on Legislation reported the following resolutions which relate to two specific bills now before the Texas Legislature:

RESOLVED, In the matter of the physical contact bill, known as House Bill No. 24, that the Independent Telephone Association hereby begs to submit to the legislature now in session that House Bill No. 24, undertaking to force a connection between our properties and those of the Bell telephone company, we believe will be disastrous. We respectfully submit that this bill will stop further development and commit the telephone companies to a policy in vogue before the expiration of the Bell patents in 1895. This we declare to be contrary to Democratic principles such as were set forth in the last Democratic convention, as well as the previous conventions, condemning monopoly and forcing competition.

We beg to call the attention of the legislature to the rapid development of the telephone field in the last few years since our home people have undertaken and are building lines in all cities and towns of the State, together with the farmers' rural service that our members have been such extensive builders of.

Resolved, In regard to the rate bill legislation, that we, the Independent Telephone Association of Texas and Louisiana, in con-



Delegates to the Convention of the Texas Independent Telephone Association at Fort Worth.

Digitized by Google

vention assembled, hereby petition the legislature not to pass this bill, assuring it that the rates allowed are not only too low to permit a reasonable profit, but we assert that it would be below the actual cost of operation, and the passage of such a bill will be confiscation of our property and would stop all development of the telephone business by both large and small companies over the entire State. The president is hereby instructed to appoint a committee to attend the next meeting of the committee before whom this bill will come for consideration and discuss the matter with it.

A resolution extending a vote of thanks to Mayor Harris and the city of Fort Worth for their hospitality; to the Confederate Veterans for the use of their hall; to the telephone manufacturers and supply dealers for the entertainment given the delegates; to the retiring president, Mr. Casler, for courtesies shown, and to the press of Fort Worth and to Swift and Armour packing companies for the attention given the members, was unanimously passed.

The Committee on Nominations reported as follows: The majority report made by Messrs. Casler, Roberts, Chamberlin and Emmer presented the following recommendations: J. B. Earle, president; E. M. Chamberlin, vice president; C. W. Roberts, second vice president; C. W. Emmer, third vice president; Chas. F. Speed, secretary and treasurer. The minority report was the same except it substituted the name of C. A. Shock for secretary and treasurer. Mr. Speed withdrew and the election of officers as recommended was voted.

Under the order of new business and general discussion Mr. W. L. Stadelman, travelling secretary of the International Association, explained in detail the work as now being carried on by the national organization. He gave an excellent talk which was received with considerable enthusiasm. A tracing showing all the toll lines in the State of Texas was presented to the association by Mr. Charles F. Speed.

An Executive Committee consisting of Messrs. Earle, of Waco; Johnson, of Corsicana; Casler, of Fort Worth; Gould, of Ennis, and Mosely, of Weatherford, was elected.

The Committee on Constitution and By-Laws has instructions to recommend a new constitution and by-laws, or such changes as may be deemed advisable. The next place of meeting is to be determined and announced by the executive committee.

The Convention of the Arkansas Association

THE Arkansas Independent Telephone Convention, held at the Hotel Marion, Little Rock, on February 18 and 19, was called to order by Eugene Hail, president, Mr. Mack Hammett acting as temporary secretary, in the absence of John B. King. The morning session was taken up with a general discussion and the appointment of committees, which were as follows:

Committee on Nominations: P. C. Ewing, G. T. Brown, H. L. Bernard.

Committee on Constitution and By-Laws: P. C. Ewing, Mack Hammett, A. E. Boqua.

Committee on Membership: Dr. K. E. Hudson, Dr. R. M. Drummond, Mack Hammett.

Committee on Ways and Means: Chas. F. Speed, Dr. K. E. Hudson, W. L. Caldwell.

At the afternoon session the Committee on Ways and Means brought in two reports; the majority report was as follows:

We, the majority of the Committee on Ways and Means, beg to report our recommendations as follows:

Exchanges doing business in the State shall pay annual dues of five cents per telephone unit, and that long distance companies shall pay five cents per circuit mile. That the Independent telephone manufacturers doing business in the State and exchanges outside of the State desiring to join the association may be admitted to the Arkansas Independent Telephone Association on payment of five dollars per year dues.

We further recommend that the constitution be changed to conform with the above.

(Signed) CHAS. F. SPEED,
W. L. CALDWELL.

Mack Hammett.

Dr. Hudson brought in a minority report as follows:

It is recommended that we assess a two dollar fee against all members of the association.

After considerable discussion, in which it seemed to be the idea to keeping the annual dues as low as possible, it was finally moved by P. C. Ewing that the annual dues of the Arkansas Independent Telephone Association be made one dollar for each member, and that each exchange pay one cent per unit per year, and that the long distance companies shall pay one cent per circuit mile, and this measure was adopted.

Among the companies represented at the meeting were the following: Home Telephone Company, Ozark; Little Rock Telephone Company, Little Rock; Pan Telephone Company, Fort Smith; Russellville Telephone Company, Russellville; Franklin County Telephone Company, Charleston; Pine Bluff Telephone Company, Pine Bluff; Felker Telephone Company, Ozark; The Telegraphone Company, Little Rock; Atkins Telephone Company, Atkins; Benton Telephone Company, Benton. All of these companies made regular payments of dues.

Among the manufacturers who gave exhibitions were Long Distance Telephone Manufacturing Company, South Bend, Ind.; E. B. Kramer, Russellville; Stromberg-Carlson Telephone Manufacturing Company, Rochester; Frank B. Cook, Chicago.

The committee instructed to investigate the proposed legislation relative to physical contact reported the following resolution:

To the Senate and House of Representatives of the State of Arkansas:

We, the officers and members of the Arkansas Independent Association, through its committee, do hereby recommend that Senate Bill No. 30, introduced by Mr. Lambert, do not pass, for the following reasons:

First. It is monopolistic in its nature, because, as we all know, competition helps the general public in all propositions.

Second. It is our opinion that the passage of a general law compelling two telephone companies to interchange business would result in forcing them to consolidate for their mutual protection. The consequence would be, we believe, a return to conditions practically the same as those prior to the time the patents expired in 1895. There is no line of business in which competition has not been found desirable for the protection of the public, the development of the field and improvement of the service. The results secured in the telephone field since the beginning of competition have amply demonstrated its advantages. Comparatively few people in the United States appreciate the rapid change in the telephone development during the past ten years. To-day there are twenty times as many telephones in use in both systems as there were at the time of the inception of competition.

Third. Should this bill pass, the telephone development would stop, and as in proportion to the stoppage of it the efficiency would also stop, to the disadvantage of the general public.

Fourth. Section 1, lines 10, 11, 12 and 13, provides that the long distance lines may refuse connections with the local company on the ground that the physical condition of such a company is not sufficient to guarantee good service. It also stipulates that the local company shall comply with regulations of the long distance company, but no provision is made whereby the long distance company shall comply

Eugene Hail.

P. C. Ewing.

Digitized by Google

with the regulations of the local company, and it leaves it optional as to whether the long distance company shall make connections or not.

Fifth. We also further object to the amendment to Section 2, which provides for the payment of ten per cent. (10%) to the local companies by the long distance companies for originating business. This, we believe, is unfair and unjust, as it is not sufficient compensation for the amount of service rendered. The originating of telephone business necessitates a certain amount of clerical work, making out accounts, etc., and in the event of poor collections, no collecting agency would take these necessarily small amounts and collect them for the ten per cent., as this amendment provides that the originating company shall pay to the long distance company ninety per cent. (90%) of such business at the end of each month, thereby holding the local company responsible for all out-going messages.

We respectfully ask your honorable body not to pass this bill. It is a matter of vital importance to every citizen of the State of Arkansas, and the passage of the same would work a hardship on the general public by forcing upon them a monopoly in the telephone business.

Signed, R. M. Drummond, chairman; W. H. Felker, R. E. Hudson, secretary.

A. E. Boqua.

The Committee on the Constitution recommended, first, that Section 3 be changed so as to read, "Each member of this association shall be entitled to a seat in the convention, but voting power shall be governed by the number of units represented by the telephone company; each multiple of five hundred or a fraction thereof shall be entitled to one vote. Independent telephone manufacturers and supply dealers can become members of this association by payment of one dollar annual dues, but they shall not be entitled to a vote."

Second, that in each case where the word "Directors" appears in the Constitution, the word "Trustees" shall be substituted. These changes were adopted.

Mr. Boqua suggested that the secretary have copies made of the proposed Senate Bill No. 30, and the resolution passed by the association, and that a copy be forwarded to each Independent telephone company in the State not represented at this meeting. He also suggested that the secretary write and mail a letter to each requesting that he correspond with his senator and representative in an effort to show the true conditions.

Tuesday morning's meeting came to order at 10 o'clock.

The president appointed the following Committee on Legislation: P. C. Ewing, Mack Hammett, Chas. F. Speed.

The election of officers resulted as follows: P. C. Ewing, Little Rock, president; A. E. Boqua, Fort Smith, vice president; Chas. F. Speed, Texarkana, secretary; Mack Hammett, Pine Bluff, treasurer; C. L. Humbert, Jonesboro, trustee.

The above officers were elected unanimously and constitute the board of trustees.

It was moved by A. E. Boqua that "the Arkansas Independent Telephone Association extend its thanks and appreciation to the International Independent Telephone Association for sending its traveling secretary, W. J. Stadelman, to its meeting, and voice our appreciation to Mr. Stadelman in person for the interest shown and information he so kindly furnished us." and unanimously passed by the members of the association.

On motion of Dr. Hudson it was voted to hold the next meeting at Fort Smith. At the close of the meeting the individual members spoke with enthusiasm of the prospects for growth this year.

A Group of Members of the Arkansas Independent Telephone Association at the Convention.

DATE OF CONVENTION OF MISSOURI INDEPENDENT TELEPHONE ASSOCIATION ANNOUNCED.

THE annual convention of representatives of the Independent telephone companies in Missouri will be held at the Kupper Hotel, Kansas City, Mo., April 24 and 25. This was decided upon recently at a meeting of delegates representing the several districts of the State.

There are now said to be about 175,000 telephones in the State classed as Independent. At the coming convention there are expected to be about 200 representatives and visitors. Important subjects will be discussed having a bearing upon matters of operation and development. During the past year the organization of the associated companies has been improved, and individually they have developed rapidly. New exchanges have been built, many subscribers added, and the companies find that the necessity for considering means of improving operating relations is becoming very important. Although good progress has been made in overcoming the opposition of the Bell company during the past year it is expected that this will be improved upon in the future, as the Independent men become more thoroughly organized. It is important that every company should send a delegate.

SPRINGFIELD, MO., SOON TO BE EQUIPPED FOR INDEPENDENT TELEPHONE SERVICE.

UDERGROUND wires have been laid through a large portion of the business section of Springfield, Mo., by the Home Telephone Company, which some time ago was granted a franchise for an Independent telephone system. Additional conduits are being rapidly placed, so that on the completion of this work the company will have in position no less than twice the amount of underground cable which was stipulated at the time the franchise was granted.

A feature of the company's work which has gone far toward producing a feeling of satisfaction with its management is the careful manner in which this underground work has been done. It is reported that special care was given to maintaining the streets in good condition, and replacing the pavement promptly after the conduits were laid. The result has been very satisfactory not only to the people in general, but to the city officials.

NORTH DAKOTA RURAL TELEPHONE COMPANY MAKES GOOD START.

A COMPANY was organized a year and a half ago by farmers residing in Pierce and Rolette Counties, N. D., to operate an Independent telephone system. Eighty-two miles of lines have already been built, and so well is it being supported by the people of the communities in which it operates that it expects to increase the length of its lines to 200 miles before next fall. It is a co-operative company and started with but thirteen members. Its lines now furnish communication between the towns of Grano, Brazil, Rugby, Nansen, Rolette and Campbell Post Office, and in addition connect with nearly every farm house along the way giving a very satisfactory service.

Advantages and Benefits of the Collector's Route Book

By F. V. Newman, Assistant to the General Manager, Citizens' Telephone Company

THE use of the Collector's "Route Book" by the Citizens' Telephone Company, of Grand Rapids, Mich., has enabled the company to collect 70 per cent. of its quarterly rental and toll accounts during the first month of the quarter. At the close of the second month of the quarter 86 per cent. of outstanding quarterly rental and toll accounts are collected, and at the close of the quarter but 3 per cent. are left uncollected. By the use of a rapid addressing machine the 8,500 rental bills are printed, showing the subscriber's telephone number, name and address, and amount of quarterly rental due, also the letter of the collector's territory and the numbers of the routes in the territory. The printing of these bills is completed in one day by the operator of the addressing machine.

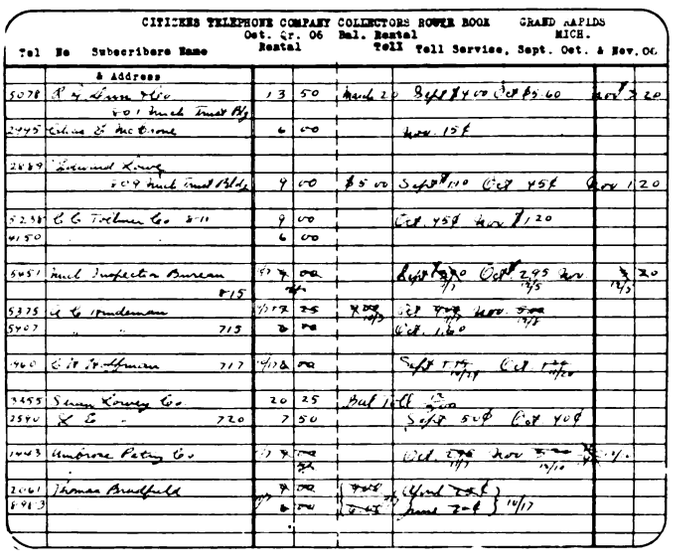

Fig. 1. Sample double-page record from collector's route book.

The city is divided into collection territories, and the territories into routes. The territories are lettered according to the territory assigned each collector, the routes according to the number of routes each collector has; that is, if the collector has territory "A" and there are several routes in this district, they will be known as routes 1, 2, 3, etc. The territory letter and route number, both of which are printed on the bills, enable the chief collector to sort the bills very rapidly. In sorting the bills he can note the territory letter and sort the bills into groups accordingly. After he has them all sorted into territories, he re-sorts the bills for each territory according to routes, and then arranges the bills for each route to correspond to the locations of the subscribers' stations. Should a subscriber owe any rental or toll account that is in arrears at the beginning of the quarter, a separate statement is made of the indebtedness and the chief collector places these statements with the corresponding bills for the new quarter's rental.

When the routing of the bills has been completed, the bills are given to the different collectors, who in turn copy them into the "Collector's Route Book" (Fig. 1). They note the subscriber's telephone number, name, amount of rental due, also the address of the subscriber. The rental for the current quarter is noted on one side of the page; if there is any balance due, the amount is noted on the opposite page. This arrangement enables the collector to note just what amount the subscriber owes. In writing these accounts in his route book, the collector occasionally skips a line or two, so that if any new subscribers are added to his territory he can enter them very near to the proper place in the route after he has noted other required information in his book.

If the subscriber is in when the collector calls, and payment is made, the collector receipts the bill and enters the amount paid in the back pages of his route book, In this entry he notes the amount paid and the date. The collector then scores out the amount in the page devoted to the regular "route" list, but does not erase the name of the subscriber. He also notes, above the amount he scores out, the date of the payment in small figures. This is done in order that, should he ever be asked on what date the subscriber paid, he may obtain the information by referring to his book.

It is customary, if payment is not made on presentation of the bill, or if the subscriber is not in, to have the collector render the bill. The object in rendering the bill is to give notice that the account is due, and if the subscriber chooses to call and make payment at the office or mail a check in settlement, which is very often done, he can do so.

If a promise is given to pay on a certain date, the collector enters the agreement upon an appointment slip. These slips are filed each night in a dated file at the collection department. When the date for payment is at hand, a memorandum is given to the collector, requesting him to call. The original appointment slip is retained by the chief collector, so that he can ascertain whether payment is made on the date promised.

After the collector has completed the work of rendering all the bills he has in his possession a complete record, according to routes of all accounts still due and unpaid in his territory. With this systematized record, a collector can call on any of his subscribers in any of the routes in his territory at any time, and have the information as to the amount due the telephone company.

The bills for long distance service for each month are routed by the chief collector in a similar manner as the rental bills. In the first month of each quarter they are presented with rental bills. The collectors copy the amount due opposite the subscribers' names in the route book, also noting the month that toll service was furnished. The daily collections received at the company's office through the mail and paid to the cashier are entered on a report by the cashier. A duplicate of the cashier's report is handed to the collection department every morning. When the collectors assemble the chief collector reads the record of payments to the collectors who have these accounts, and they score the amount of payments off their route books.

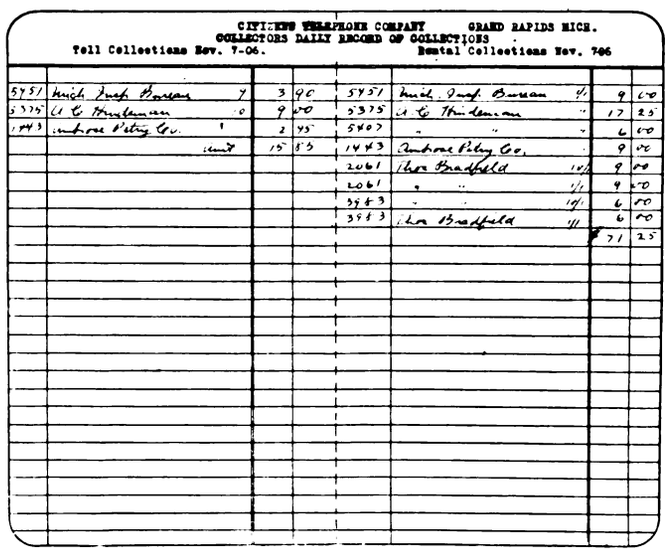

Fig. 2. Sample record of collections as placed in collector's book.

QUERIES

CODES FOR RURAL LINE RINGING.—(826.)

Will your readers kindly give the best method for arranging rural line calls so that directory numbers will indicate line and ring?

SINCE printing the above inquiry two weeks ago we have received a very large number of replies from managers of telephone companies in all parts of the country. Some do not fill the requirements of the original query, but will be published to give our readers an idea of the great diversity of practice in this respect, and set forth whatever merit exists in each plan.

The Jones County Telephone Company, Anamosa, Ia., is using a code which is printed on the first inside page of the directory, with instructions, as follows:

CODE OF RURAL RINGS.

· Short Ring. — Long Ring

— CENTRAL.

BROWN	GREEN
0 ··	0 ···—
1 —·	1 —···
2 ·—	2 ··—·
3 —··	3 ·—··
4 ··—	4 —··—
5 —·—	5 ·——·
6 ·—·	6 ——··
7 ——·	7 ··——
8 ·——	8 —·—·
9 ···	9 ····

General Line Ring, Six Short Rings.

Instructions to rural subscribers for ringing parties on their own line:

All numbers with the colors BROWN AND GREEN indicate rural subscribers. The last number before the color indicates the ring and the other number or numbers indicate the number of the line.

For example 212 Brown would be 2 Brown on line 21 or 212 Green would be 2 Green on line 21. 12 Brown would be 2 Brown on line 1, and 21 Green would be 1 Green on line 2.

Table 826a.

This plan, it will be observed, provides a code for a 20 party line, with a means of indicating any ring by the addition of a single figure to the line number.

Jeff Austin, manager of the Brookport Telephone Exchange, Brookport, Ill., sends an interesting plan for designation in which the only call upon an operator's or subscriber's memory is due to the use of a few code letters, the significance of which is soon learned.

The total number of rings is indicated by the last figure of the number appearing in the directory. All signals associated with code letters B, A, and M are made up of one long ring and a number of short rings. The relative position of the long ring is indicated by the letter used. Thus B means that the first ring is long; A, last ring long; M, long ring in the middle. The letter S denotes a signal with all rings long. A single long ring is reserved for a signal to call the operator. A sample code for twelve parties on line 8 would be indicated as follows, using the conventional long and short dashes to represent rings:

82 B —·	83 B —··	84 B —··	85 B —····
82 A ·—	83 A ··—	84 A ···—	
82 S ——	83 S ———	84 S ————	
	83 M ·—·		85 M ··—·

Table 826b.

An interesting code, for which the advantage of easy memorization is claimed, had been devised by A. E. Coe, manager of the Central Square Telephone Exchange, Central Square, N. Y. Following the line number in the directory list is a two-figure numeral which indicates the ring. The code may be represented as follows:

01 —·	06 ·——	11 —·—	16 ·—··
02 ·—	07 ——·	12 —·—·	17 ··—·
03 —··	08 ··——	13 —···	18 —·——
04 ··—	09 ——··	14 ···—	19 ——·—
05 ——	10 ———	15 ···	20 ··

General Ring to call all parties ——— ——

Table 826c.

On hearing any number the operator mentally cuts off the two right-hand figures, plugs into the jack designated by the remaining left-hand figures, and rings according to the code. By printing the line and ring numerals in different styles of type the subscribers may be led to give the number in such a way as to separate the party call—as **12**15 will be pronounced twelve-fifteen.

In the code it should be noticed that the calls have a certain relation to each other, odd and even numbers reversing, and that the odd numbers in the first ten calls begin with the long ring.

S. C. Snow, manager of the Blakesburg Telephone and Telegraph Company, Blakesburg, Ia., tells of his experience with a letter code, and the substiute which was devised, as follows:

"We tried lettering our lines, A, B, C, and so on, but found it to be a failure, as B, C, D and E sound so much alike, when heard through the receiver, that people would frequently get the wrong connection.

"We now write them thus in our directory: 5-2211, 9-212, 99-2121. The number 1 is a short ring, and the number 2 is a long ring, and the first number names the line, so the above would be line 5, two long and two short; line 9, long, short, long; and line 99, long, short, long, short, respectively."

The use of combinations of the numerals 1 and 2, indicating respectively short and long rings, is also mentioned by E. B. Rodgers, manager of the Ormond Telephone Co., Ormond, Neb. A variation consists in the placing of the code number before the line number, separated from it by the letter L, as printed in the directory, the advantage claimed being, apparently, that the proper signal is fixed in the operator's mind before she plugs into the jack, thus reducing the liability to error. A number is printed as follows: 221L5. A few practical points to which Mr. Rodgers calls attention are as follows:

The use of a certain number of short rings and a like number of long rings to designate different parties on the same line is

11 ··	122 ·——	1122 ·——
12 ·—	221 ——·	1222 ·———
21 —·	211 —··	2221 ———
111 ···	1111 ····	2211 ——··
112 ··—	1112 ···—	2111 —···

Table 826d.

liable to lead to confusion. One subscriber will ring during as long a time for what he calls a "short" ring as another for a "long" ring. It is insisted that all calls shall be given by number and not by name.

The code which is actually in use on a fifteen party line is made up as shown in the accompanying table, 826*d*, the rings being indicated by dashes for the sake of comparison with other tables:

Managers having interesting material to contribute to the discussion of this subject are invited to forward it as soon as possible.

SYSTEM IN COLLECTING SUBSCRIBERS' ACCOUNTS.

THE article on another page of this issue, describing the collecting system used by the Citizens Telephone Company, by its incidental mention of the extremely good showing obtained serves to draw attention to the importance of regularity in handling subscribers accounts. The arrangement of bills according to routes which are not changed from time to time, and are always covered in the same order, is probably one of the principal reasons for the satisfactory results in reducing the number of delinquent payments which have been produced. Subscribers learn to expect the collector at a time which may be determined almost exactly, even down to the hour, and are more likely to be ready to make their payments than if presented with a bill after an unsettled interim of waiting. Especially in the matter of residence telephones they are able to adjust their various payments on household accounts so that the telephone company's bill is taken up each month in its regular turn.

When payment is not made at the first call, a promise to be ready on a certain date is usually obtained, and the telephone company is still able to keep up the impression that it looks carefully and promptly after its business. As brought out in the article, this is made possible by the filing memoranda according to the dates for which the promises of payment are made. As each day comes the collector takes the corresponding promise slip and looks up that subscriber. The effect of this is shown in the percentage given for collections before the end of the month.

Other advantages to the company apparently result from what may be termed an increase in the daily efficiency of the collectors. Not only do the men themselves benefit by having such a routine, but it is evidently very easy for the officials of the company employing such a system to keep a close check on the work of its men. The collector's book system of keeping records as compared with other methods of handling collections in which a regular route is laid out, possesses the additional special feature of making it possible for men to keep more closely and permanently in touch with their work, as in handling any particular case they have in their possession records which furnish them with complete and accurate information concerning the past indebtedness and payments of the subscriber.

RURAL LINE OPERATORS AND TELEPHONE CONVENTIONS.

WHAT promises to be an exceptionally interesting feature of the coming convention of the Iowa Independent Telephone Association is the special attention which is to be given to the conditions of rural line operation. In Iowa such action is particularly desirable owing to the fact that an exceptionally large proportion of the telephone subscribers are farmers, whose instruments are connected to rural lines, many of which are operated on the mutual plan. The control of these systems is very often so divided among numerous small associations, no member of which derives a considerable pecuniary profit from his activities in telephone work, that it has been considered impracticable for the managers to keep closely in touch with the general conditions of development throughout the State.

The result has been, altogether too often, the production of the greatest confusion, affecting alike the business management of the company and the interests of its subscribers, when the growth of a system which started on a small scale has reached a point which calls for the formation of closer relations with neighboring organizations. Although eager for information the men who build the small companies, starting in without the slightest experience in buying telephone material or building lines, make errors which, in proportion to the amount of money spent, are very costly.

Methods of avoiding such errors are known to many Independent telephone men in every State and discussion at conventions gives them a chance to freely pass this knowledge on to their associates who have not had equal advantages in the way of experience. When such a discussion is carefully planned and organized by a competent group of men, who take advantage of opportunities for consultation, and arrange a program which permits a large field to be covered without waste of time the financial benefit which it is possible for representatives of the smaller companies to obtain will undoubtedly amount, in the aggregate, to a very considerable sum.

Greater familiarity with the work which is being done by their associates is likely to lead representatives of the smaller organizations to a more thorough appreciation of the need of intelligent co-operation of all companies, not only in business matters, but in questions of building and operation. The business relations of many connecting companies are open to wide improvement before the highest economy and satisfaction may be attained. Much practical work in the way of building up plans for the joint handling of traffic in a way which will be fair to all parties concerned, and aid each participating company in inspiring a confidence which will help in the upbuilding of its own business needs to be done. Every telephone man is coming to realize more and more thoroughly as time goes on that his individual plant, although free to handle its business in its own way, must be in the eyes of his subscribers who look for an efficient and far-reaching service, a unit firmly joined to the other neighboring members of a great system. Although his territory may have boundaries, there must be nothing in the service which he offers which will cause subscribers to think that their field of communication is limited. The relations which must be established before this desirable, and in fact absolutely essential, condition may be attained can be in no way so efficiently built up as through free and open discussion by large groups of men. Every effort of the officials who represent a State association looking to the promotion of such an end deserves the most active and hearty support of all members who are in a position to render their aid to the movement.

WATCHING THE LEGISLATORS.

THREE State conventions, occurring within practically as many weeks, have found it necessary to devote a large proportion of their time to the discussion of pending legislation of a nature expected to be injurious to the interests of the telephone companies. These States do not by any means represent all the places where such action is considered desirable by many telephone managers. The fact is that not merely the increase in the importance of the telephone industry and the growth in the number of people directly concerned with the telephone service, but also the widespread publicity which is being given to telephone affairs tends to make this class of business a special mark for legislative attention. In many of the measures which have been introduced there are evidences of haste, showing a lack of careful consideration of the interests of both the public and the telephone companies. Telephone managers might find it a good thing to maintain an acquaintance with their representatives, and keep carefully advised of their intentions. It is easier, and far more pleasant, than to be forced to consider such matters after the injury is proposed.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. MCMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

STRIKES AS DEFENSES AGAINST NEGLIGENCE.

A resident of the city applied to us for the installation of a telephone in his house at a time when we were suffering from a strike of our employees so that we could not establish a telephone for him. He then made a peremptory demand and at the same time offered us the necessary rental in advance. We informed him that we were unable to supply him with a telephone until the strike was settled as we had no one on hand competent and willing to put in his telephone. He is now asking that we pay him the sum of $200, which is established by the state law as a penalty for refusing to install a telephone on demand. It seems to us that the strike of our employees ought to be sufficient excuse for our inability to supply his telephone. Kindly give your opinion on this as promptly as you can. C. C. W.

WHEN a company relies on the defense that the cause of a loss or injury to any person is the act of a strike of its own employees, it must be shown that the act was the approximate cause of the loss, since if any wrongdoing of the company contributed to the act or acts alleged, it is presumed to be the real cause of the inquiry; and the burden of proof is thrown upon the company to show that the real cause of the loss was the strike. We know of no decided case which applies this law to the attempted collection of a penalty established in such statutes as the one you mention, but suppose the same rule would apply, and that the strike would be a sufficient defense in any action. It would be necessary for the company to prove that it had used its best efforts to obtain workmen in place of those on strike, and possibly also to show that it had not caused the strike, although it might be successfully contended that the cause of the strike was immaterial. Jones on Telegraph & Telephone Companies, Section 365.

COMPROMISE AGREEMENT WITH INDEMNITY COMPANY HELD CONCLUSIVE.

THE Cumberland Telephone and Telegraph Company brought suit against the Frankfort American Insurance Company to recover $5,000 on indemnity security and $7,500 for alleged damages. The indemnity company claimed that the telephone company was indebted to it for having failed to give a proper amount for expenditures for the operation and maintenance of its lines, and asked a judgment for the amount when ascertained. The indemnity company insisted that it had been misled and that the telephone company had withheld information that should have been given. The compromise agreement was reached by the telephone company and the agent of the insurance company, which, the telephone company insisted was a final settlement of the matter involved. The lower court rendered a decree in favor of the telephone company for $5,000 which the Court of Chancery Appeals affirmed; the decision held the compromise conclusive, and found that no withholding of material facts or other evidence of fraud.

CONSTRUCTION OF RIGHT OF WAY CONTRACT.

THE American Telephone and Telegraph Company was sued in Sullivan county, New York, by Roderick Morrison, who owned a valuable tract of land, containing about 3,100 acres. He charged the company with cutting timber from a strip the length of the entire tract, and of an average width of twenty-four feet, and setting its poles along the route thus opened. The company claimed the right to occupy the land by reason of a written instrument, which, in consideration of five dollars paid to the plaintiff, granted the company the right to construct its lines "over and along" the property in question, "including the necessary poles and fixtures along the roads, streets and highways adjoining the property . . . said sums being received . . . in full satisfaction for the trimming of any trees along said lines . . . and the right to cut down trees to clear line." The court held that this grant limited the company's rights to the construction and maintenance of the line along two public highways, which extended through the tract of land and not across the land. The damages which the plaintiff was entitled to recover were for the diminution in value based upon the cutting of the timber, or making of the roadway, and the maintenance of the line to the commencement of suit. Since action for future trespass might be maintained it was held improper to allow damages for the entire value of the land taken and all damages that might accrue upon the assumption that the company's trespass would be permanent. Morrison vs. American Telep. & Teleg. Co., 101 N. Y. S., 140.

IMPERSONATING ANOTHER PARTY OVER THE WIRE.

What, if any, is the recourse to a person impersonating another party over the wire in Ohio? H. R. S.

THE recourse against a person for impersonating another on the telephone depends entirely on what was done by the one assuming the impersonation. There is no penalty for the act itself, irrespective of its consequences, but if the impersonator secured money or property by his act he would be liable criminally for obtaining money under false pretenses, and if he causes damages to another he would be liable civilly for his damages. We cannot answer the question definitely without knowing the circumstances more fully.

ORDINANCE TO BE A CONTRACT MUST BE ACTED UPON.

THE New York Electric Lines Company applied for a mandamus against William B. Ellison to compel him, as commissioner of water supply, gas and electricity of the City of New York, to grant it a permit to make excavations in certain streets. In 1883 the Board of Aldermen passed a resolution granting permission to the company to lay wires in and through the streets of the city. Under this authority the company applied to the commissioner of public works for a permit to make excavations, but this permission was refused and the company then brought a suit for mandamus, which was denied because it had not secured the approval of the Board of Electric Control to its plans. Nothing further was done by the company until December, 1905, when it made another formal application for a permit to the commissioner of water supplies. The company again brought suit for a mandamus. One of the contentions of the company in this second suit was that it had a contract with the City of New York and that certain action by the legislature granting to the Board of Electrical Control the power to approve plans for subways impaired the obligation of its contract with the city. The court held that to constitute a contract between the city and the company something more was needed than the mere granting to the company of the permission to use the streets. The company had not agreed to construct the subways or entered into any obligation whatever. The court therefore held that there was no consideration and hence no contract, the obligation of which could be impaired. People vs. Ellison, 101 N. Y. S., 55.

IN THE OPERATING FIELD

ADVANTAGES AND BENEFITS OF THE COLLECTOR'S ROUTE BOOK.

(*Continued from page 142.*)

When a subscriber moves from one collector's territory a notification is sent to the collection department by the contract department. It is the duty of the collector from whose territory the subscriber moves to note the amount due on the removal order and pass it over to the collector in whose territory the subscriber has newly located. At the same time the collector makes a notation opposite the name in his route book to the effect that the subscriber has moved, and he has handed the account over to another collector for collection.

When a collector receives a notation of a discontinuance for a subscriber in his territory, he scores the amount due off his route book and awaits a corrected bill. During the quarter at a convenient time, after business hours, there is a comparison between the lease ledgers and the collectors' route books. The collectors assemble in the collection department, and the chief collector reads the telephone numbers and names of subscribers who owe accounts. The collector who collects of this subscriber reads the amount that shows due on his route book. If the amounts due agree with the lease book, they are checked with a blue pencil, which shows when the comparison is finished that the amount of the account due is correct. If there is any discrepancy it is settled immediately, so that the collector continually has a correct record.

The object of dividing the city into territories and routes is to enable each collector to learn the locations and financial conditions of the subscribers in his territory.

DELAWARE, O., GIVES GOOD SUPPORT TO INDEPENDENT TELEPHONE COMPANY.

THE Citizens' Telephone Company in Delaware, Ohio, which was organized in 1898, has just issued a report which shows that during 1906 it made the greatest growth in its existence. Four hundred and thirty-five new telephones were added to its system, making the total number in use in the city thirteen hundred and forty; while those on lines extending into the surrounding country bring its aggregate number of instruments up to twenty-one hundred and three. The report shows that the company's business is in an exceedingly satisfactory condition. Directors were elected as follows: C. D. Young, W. G. Hormell, W. Guy Jones, J. O. Gooding, W. M. Heseltine, J. L. Anderson, W. B. Hedges, A. J. Pounds, Geo. H. Carter.

INDEPENDENT COMPANY GAINS DECISION WHICH WILL AUTHORIZE ENTRANCE INTO NASHVILLE.

ONE of the hardest battles ever fought by an Independent telephone company ended in victory at Nashville, Tenn., on February 23, when the State Court of Appeals decided the case of the Home Telephone Company vs. the Mayor and City Council of Nashville, giving the company a sweeping verdict. For over two years the Home Telephone Company, a corporation owned practically by the same interests that are now building a toll line from Louisville to New Orleans, has been endeavoring to get into Nashville, but has been outdone at every turn by the Cumberland Telephone and Telegraph Company, the Bell system operating in Kentucky, Tennessee, Mississippi and Louisiana. The history of the fight is a long and interesting one and shows many of the tricks to which the Bell interests resort to carry their ends. The latest move, and the one that brought about the suit which the Court of Appeals has just decided in favor of the company, was a proposition from the Cumberland company to pay the city a franchise tax of $10,000 per year so long as no other company was allowed to do business in that city. The city agreed to this contract, but the Home Telephone Company continued putting its poles in the streets and preparing to put in an exchange. Thereupon the city threatened to cut the poles down if the work was not stopped. The Home company asked for an injunction against this proceeding and secured a temporary injunction in the lower court which was dissolved by the Chancery Court. On appeal to the higher court, however, the injunction was granted and an opinion given that the company had all rights upon the streets of the city under the statutes of 1875, and that the city's contract with the Cumberland company was an unlawful one.

When the Home company first began working to get into Nashville the City Council denied a franchise. The company then endeavored to get the Council to submit the matter to a vote of the people, but this was also denied. On this proposition was a contract on the part of the Home company to put all its wires in a conduit and that the conduit would be made sufficiently large to make room for all other wire-using companies. The Cumberland company, fearing that this would induce the City Council to grant a franchise, made a counter proposition, and agreed to construct a conduit system as a part of its contract to pay the city $10,000 per year for exclusive rights. Being unable to deal with the City Council in any fashion, the Home company began work relying on the act of 1875, which gave all public utility companies rights over the streets and alleys of all cities and public roads of the State, and it was under this act it proposed to operate without a city charter. It was here that the city threatened to cut the poles and stopped the work.

In its bill the company set out the contract made between the city and the Cumberland Telephone and Telegraph Company, by which the latter was to pay $10,000 per annum for the exclusive right to operate a telephone system, and alleged that it was contrary to public policy and tended to create a monopoly. Upon this point the court found with the complainants, saying such a contract was contrary to public policy, and therefore void.

The act of 1875, said the court, was a general law, authorizing and specifying the manner of the organization of public service corporations. It made distinctions between local corporations and general corporations, giving them separate powers. A street car company was local and must depend upon the consent of the city in which it operated for the privilege of operating. So also with any purely local company that only affected a community of a county. With corporations of general character, which served all of the people of the State, or perhaps several States, the power of saying where they should operate and how was vested in the State and not in the city, but even the General Assembly had no authority to exclude one company and permit others to enter.

The entire dependence of the city was placed in a clause in the amended charter of 1899, which provided for popular elections before the authorities should grant a franchise. The court on this point declared that a city charter could not abrogate a general law—the city had no right to grant a franchise of any sort without the sanction of a general law. A bond issue could not be made simply because the people voted to make it, but it must be authorized. While municipalities were granted certain rights and given certain powers, they could not be delegated with an authority when it was questionable as to whether the General Assembly possessed such authority. It was certainly not possible for a city ordinance to abrogate a general law.

The city had the right of police regulation, of taxation, could prevent the company from obstructing the streets or interfering with the inalienable rights of the citizens, but it certainly had no authority to exclude the telephone company from the streets.

Digitized by Google

This decision settles the controversies between companies in Tennessee and it may contain many valuable pointers to companies in other States that have not gone as far into the legal question as this case has gone. It was a bitter sermon to the Cumberland company, for the case at stake was in the very home of the Cumberland company, where its commercial power political authority and all other forms of influence were at hand.

INTERESTING FEATURES OF ANNUAL REPORT OF TOLEDO INDEPENDENT COMPANY.

ON December 31st, 1906, as shown by the anual report of President Jas. S. Brailey, Jr., the Toledo Home Telephone Company had installed and connected with its telephone system in Toledo 11,877 telephones, an increase for the year of 2,021 telephones. On the same date it had installed and connected 104 private branch exchanges and inter-communicating systems, with 2,194 sub-stations, an increase for the year of 33 private branch exchange and inter-communicating systems and 961 sub-stations. Service tests made by stop watches through subscribers' stations show that the average time in which operators answer calls is 3 2-5 seconds.

January 1, 1903, after six months operation, the company had 5,600 telephones in service, and handled 65,000 calls per day—or at the rate of 23,000,000 calls per annum. January 1, 1907, it had in service 11,877 telephones, and handled 225,000 calls per day—or at the rate of 81,000,000 calls per annum.

As compared with January 1, 1903, the cost of service to subscribers has been reduced 50 per cent. At the same time the facilities for use of telephones have increased 100 per cent. That is, the number of telephones with which each subscriber can connect has been more than doubled, while the cost per call to the subscriber has been reduced one-half.

Gross earnings for 1906 were $64,813.64 in excess of those of 1905, while operating expenses increased by $23,740.92.

MEXICAN INDEPENDENT SYSTEM NEARLY COMPLETE.

THE underground work of the New Telephone Company, which is building a large telephone system in the City of Mexico to operate in competition with the Bell company, is nearly complete. The conduits are already laid, and many of the cables at the present time are being pulled in. At the company's headquarters a force of girls has already been engaged, and they are being given instructions to fit them for their duties as operators. The candidates have been selected very carefully, and it is expected that the Independent company will offer a most excellent service. The entire plant is reported to be laid out and constructed in a very thorough manner in spite of the numerous and peculiar obstacles which have been met.

MERGER OF NEW YORK INDEPENDENT INTERESTS WITH BELL COMPANY ENJOINED.

NEWSPAPERS in many sections of the country have for some time past contained rumors of negotiations which were said to be going on in the interests of the Bell company with the object of obtaining control of the United States Independent Telephone of Rochester, N. Y. Although little authentic information was given to the public, the latest step in the case is the announcement of an injunction obtained by Attorney-General William S. Jackson of this State, ordering the restriction of such a merger on the ground that it would create a monopoly in the telephone business in a portion of the State. The information on which this order is based was presented by Jas. B. Hoge, of Cleveland, president of the International Independent Telephone Association of America, and other representatives of Independent telephone companies.

The question is to be further considered at a hearing which has been set for March 7th to give time for the preparation of arguments.

INDEPENDENT SERVICE SHOWN AT PUBLIC EXHIBITION IN PROVIDENCE, R. I.

THE Food Fair recently held at Providence, R. I., gave the Home Telephone Company, which is applying for a franchise in that city, a new opportunity to present a convincing argument concerning the value of the service it proposes to give. Two booths were opened and attractively decorated, and within them were placed a switchboard and an exceptionally fine display of telephone apparatus of the type which is to be used by the company. Telephones were installed in various parts of the hall and connections made as required. The public in general and the local newspapers offered some very interesting comments on the display. It seemed to be the general opinion that the instruments were considerably superior to the types furnished by the Bell company, owing to the fact that they are smaller and much neater in appearance. The use of the Shield in prominent locations in connection with this exhibition was an especially interesting feature.

THE SLEET AND SNOW PRIZE STORY CONTEST

HAS ONLY A FEW WEEKS MORE TO RUN

IF you have taken your photographs they should be sent in as early as possible, with a thorough statement of facts. Read the conditions carefully as published in early issues of the year. Do not think they are too difficult. All that is required is a simple statement, but let it be as complete as possible. If you have not yet had an opportunity to take photographs, be on the watch for a sleet storm. Do not let this chance slip—all good material will be paid for in any event—and someone will get the $20 PRIZE. IT'S WORTH TRYING FOR.

KENTUCKY CITY COUNCIL DECLARES BELL COMPANY A NUISANCE.

IT is reported from Hopkinsville, Ky., that on February 15th the city council instructed the city attorney to prepare an ordinance declaring the Cumberland Telephone & Telegraph Company a nuisance in Hopkinsville. The reason for this action is that the franchise of the Bell company expired in 1902, and since that time it has continued to operate without having purchased a franchise. The citizens of the city are said to be thoroughly dissatisfied with the service rendered by the company, and with the treatment accorded its patrons and others in the city in many ways. It is generally believed that it will be for the advantage of telephone users to have the company's service completely discontinued. In the event of the passage of the ordinance which is to be submitted by the city attorney the Bell company will be obliged to pay a fine for every day which it continues to operate without a franchise.

BERLIN VI.—A 24,000-LINE EXCHANGE.

(*Continued from page 138.*)

50-pr. cables rising in a pit toward the main distributing frame.

From the main distributing frame the conductors, as may be seen from the illustration, rise in 21 pair interior cables toward the intermediate hall proper, where they are taken to the jack panels of the intermediary switchboards and then through all the rows of panels and to the intermediate distributing frame for distribution to the answering jacks and relays, connections being made between opposite sides of the frame by short wires.

The installation of this change was under the direction of Messrs. Siemens & Halske.

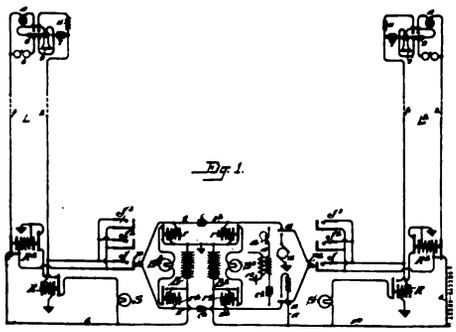
TELEPHONE PATENTS

TELEPHONE SYSTEM.

William W. Dean, Chicago, Ill., patents (No. 841,223; dated January 15, 1907; filed January 23, 1905; serial No. 190,311) and assigns to the Kellogg Switchboard & Supply Company, Chicago, Ill., a telephone system.

This patent covers an arrangement of line and cut off relays in connection with suitable cord circuit. Cut off relay R^2 is permanently connected to the sleeve of the jack, and line relay R is connected to the tip. When a subscriber takes off his telephone the line relay is operated by current flowing from battery B through conductors 5, 4, etc., and back through the winding of the relay. The insertion of the operator's plug closes a circuit



to ground through cut-off relay R^2. The operation of this relay disconnects the signaling circuit which was completed through the armature of the line relay, and connects the sleeve of the jack to conductor 3 of the subscriber's line.

AUTOMATIC SYSTEM OF INTERCOMMUNICATION.

Anthony Van Wagenen, Sioux City, Ia., patents (No. 836,904; dated November 27, 1906; filed July 31, 1902; renewed March 3, 1906; serial No. 304,051) an automatic system of intercommunication.

This patent covers an arrangement of circuits for a common battery automatic telephone exchange. The inventor states that this system is adapted to the use of a calling transmitter at the subscriber's station and selective switches at the central office, of a type covered in previous patents. Means are provided for preventing the calling transmitter from operating the central station switches designed to be controlled from another line. When a subscriber has obtained connection with the desired line, through a proper manipulation of his signal transmitting mechanism, he calls the second subscriber by using the generator at his station.

TRUNKING SYSTEM.

Harry G. Webster, Chicago, Ill., patents (No. 843,245; dated Feb. 5, 1907; filed Dec. 8, 1902; serial No. 134,263) and assigns to Kellogg Switchboard & Supply Co., Chicago, Ill., a trunking circuit.

This patent covers a circuit for trunking from a toll to a subscribers' board, which has the following operating features: When the toll operator plugs into the jack connected with this trunk she closes a battery circuit in the trunk line through her clearing out drop, operating a relay to light the calling-lamp as well as the pilot lamp at the trunk position. The trunk operator connects her receiver with the line and receives the order, testing the desired line, and if she finds it idle inserts the plug. This act causes to be extinguished the calling lamp and also operates a relay which causes the illumination of a ringing lamp. Another result is the closing of a relay in the sleeve circuit which normally keeps the tip of the plug disconnected from the trunk line and connected to a testing circuit. When this sleeve relay is operated, upon the insertion of the plug, the test relay is disconnected and the tip circuit closed for conversation.

Battery is supplied to the subscriber at this end of the trunk through the windings of a repeating coil leaving the line to the toll board neutral. When the subscriber hangs up his receiver the battery is connected with the metallic circuit of the trunk throwing down the clearing out drop in the toll cord circuit at the distant switchboard. This operator withdraws her plug and causes a disconnect signal to be given at the trunk position.

SELECTIVE PARTY LINE SYSTEM.

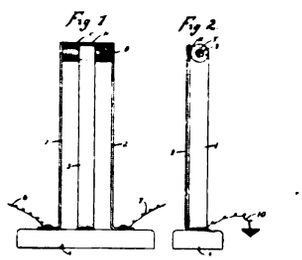
Frank J. Mersman and Joseph Mersman, Ottawa, O., patent (No. 841,033; dated January 8, 1907; filed April 14, 1906; serial No. 311,734) a telephone exchange system.

The object of this invention is the production of a selective party line system, wherein an operator may have entire control of the apparatus at any one of a number of stations on the same line. The arrangement described is for a metallic circuit line, over one side of which any one of the subscribers can signal by a magneto generator the central office, throwing a grounded drop. The other side is broken at each station, and an arrangement of relays inserted whereby a succession of impulses from the central office may cause the line to be completed to the desired station, all other instruments being cut out.

PROTECTOR.

Frank B. Cook, Chicago, Ill., patents (No. 841,849, dated January 22, 1907; filed April 16, 1906; serial No. 311,991) a protector.

In Fig. 1 is shown a side elevation of this protective device, while Fig. 2 shows an end elevation with the forward supporting spring removed. The spring members 1, 2, which with No. 3 are mounted upon a suitable base 4, support a heating



element 5, which is made of conducting material, and included in the line circuit. For convenience in mounting the heating element 5 is provided with recesses 8 at its ends, adapted to fit the projections 9 on the supporting springs; or it may be fitted with caps soldered in position and adapted to engage suitably formed ends of the supporting springs.

The element 5 is preferably made of a piece of graphite, and it is so firmly held between springs 1, 2 that a good electrical connection is assured. When the current in the line rises to an unusual value, and is so maintained for a sufficient time, the temperature of the graphite rises and heats the insulating material 11, causing it to melt. The spring 3 is normally under tension, and when the material 11 is melted forces itself against the conductor 5, thus establishing an electrical contact which allows the whole or a portion of the dangerous current to be diverted to ground 10.

THE DEADLY PARALLEL

AUTOMATICS VS. LEVERS

With GRAY PAY STATIONS you simply drop the coin in the slot

NO LEVERS TO PUSH OR PULL

GRAY TEL. PAY STATION CO.

HARTFORD, CONN.

OUR '07 CATALOGUE SENT ON REQUEST

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE—1,000 Kellogg magneto telephones; Viaduct Mfg. Co. ringers; Wabash Cabinet Company's back boards and battery boxes. Good condition, almost new. Will sell singly or in lots. For particulars, write Kinloch Telephone Company, C. W. Shands, Purchasing Agent, St. Louis, Missouri. 755

FOR SALE CHEAP—100 series telephones with Ericsson transmitters and Holtzer-Cabot generators. Good as new. Address R. Valentine, Pres., Independent Telephone Ass'n of Wisconsin, Jamesville, Wis. 783

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

WANTED—A man with three years' experience as switchboard installer and four years as Superintendent of Construction, wants a position as Manager or wire chief of a common battery plant. At present employed as installer but is married and desires a local position. West or northwest preferred. Address Box 774, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 774

WANTED—A telephone manufacturing engineer and manager, to take charge and promote a small concern. A thoroughly capable man is required. Address, Box 777, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 777

WANTED---Continued

WANTED—Position by married man of 26 as manager of common battery exchange in a town of about 5,000 or more. Have built and managed complete exchanges. Salary reasonable. Address Box 778, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 778

WANTED—Position by first class all-around telephone man with twelve years' experience. Small Independent company operating rural lines preferred. Married, temperate and trustworthy. Will go anywhere. Address Box 784, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 784

WANTED—First class wire chief for common battery plant, New York State. None but first class man need apply. Address, stating experience and references, Box 785, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 785

WANTED—Married man with five years' experience desires position as manager or troubleman. Three years with present company. A-1 references. Open March 1. Address Box 772, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 772

POSITION WANTED—An expert mechanic and designer wishes to make a change. Eighteen years' experience in the instrument and telephone lines. Technical training. Telephone engineering, Scranton School. Got the habit of "delivering the goods." Address Box 773, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 773

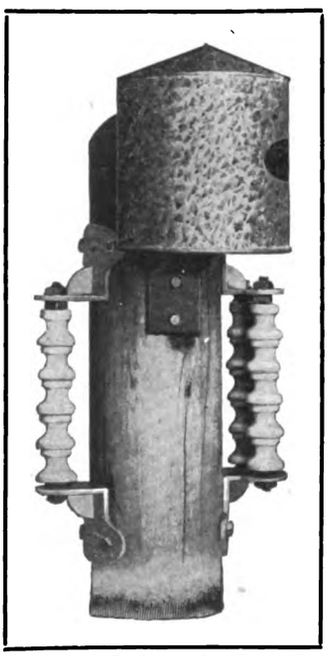
IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

A FACTOR IN MODERN WIRE DISTRIBUTION.

OVERHEAD telephone wires are fast disappearing in many cities and towns, being replaced by underground or aerial cables leading directly to a distributing point. The Robinson Distribution Rack (patented), manufactured by the W. G. Nagel Electric Company, Toledo, O., is recognized as one of the most valuable appliances used in this class of work. The advantages of this rack, which is illustrated upon this page as used in connection with a can top terminal, are said to be numerous, including that of low cost, the fact that there is no waste of insulation, and the great flexibility to which the system lends itself. For instance, if there are fifteen pairs of wires to be distributed, and five are to go from one side of the pole and ten from the opposite side, all that is necessary is to locate the respective racks to correspond to the wires. The advantages of this plan are apparent even after the wires are in place, as it is very easy to trace circuits in looking for trouble.

The insulators used on this rack have a special drip feature, which prevents leakage between pairs. Malleable iron is used in the construction of the supports, and the metal work is all galvanized. Since the introduction of this apparatus numerous improvements have been made, the nature of which will be evident from an examination of some exceptionally interesting descriptive matter which may be obtained on application to the company.



Robinson Rack and Can Top Terminal.

THE NATIONAL CONDUIT & CABLE COMPANY, 41 Park Row, New York City, has issued under date of February 20th an interesting number of its folder entitled "Copper Gossip." This contains statements as to the general business outlook, and reference is made to the copper market situation, the London market and copper mining news. Quotations of New York and London prices for the last two weeks in January and the first three in February compared with similar dates of last year are given, as well as statistics covering exports and imports and European supplies.

THE LONG DISTANCE TELEPHONE MFG. CO., South Bend, Indiana, is now mailing its new general catalog, 1907 edition, to all who desire a copy. This catalog is a very fine edition, both from the standpoint of engineering description and on account of its pleasing appearance. The cover is of handsome blue Westminster paper, printed in three colors. In addition to the two hundred handsome half-tone illustrations, a full and comprehensive description of each and every part manufactured by the company is given.

To those who contemplate entering the telephone field or for those who are looking for new equipment this catalog is especially useful as it gives a complete engineering description and illustration of all the different parts of the instrument. It is the last of a series of six publications issued during the last six months, and is the culmination of a successful sales campaign carried on under the direct and personal supervision of Mr. S. A. Duvall, vice president of the company.

THE BELDEN MANUFACTURING COMPANY, 194 Michigan street, Chicago, Ill., has recently purchased a building comprising five stories and basement adjoining its present factory. The new building has been altered in such a way as to form an addition to the present manufacturing floor space of about fifty per cent. This increase has been made necessary by the demands in all departments of the company's business, which includes the manufacture of copper and German silver for various purposes, in addition to the well known Belden specialties for telephone companies.

JULIUS ANDRAE & SONS CO., Milwaukee, Wis., reports a rapidly increasing market for the new type of condenser which is designed to be attached to telephones already in service. The condenser itself is a very neat and attractive piece of apparatus, being enclosed in a handsomely enamelled iron case, and equipped with cords and binding posts. The cords are connected up in place of the receiver cords in the telephone, and the receiver cords in turn connected to the binding posts on the condenser. This is very easily accomplished without opening the telephone cabinet at all, and does not necessitate re-soldering joints or re-wiring.

The Andrae people state that they have now placed these condensers in almost every State in the Union, and that they have given excellent satisfaction.

THE DEAN ELECTRIC COMPANY, Elyria, O., has just issued in its folder No. 6 much interesting material relating to its Express type switchboards. The drops and jacks are fully described and well illustrated, and facts concerning ringing and listening keys, operators' sets, lightning arresters, cabinets, etc., used for this type of switchboard are given. The Dean harmonic selective ringing party line equipment to be used with this type of board will give the highest grade of selective service. The company will be pleased to send this folder to all interested persons.

THE SUMTER TELEPHONE MFG. COMPANY, Sumter, S. C., has embodied some very ingenious points in its standard sub-station sets. The high grade attained by this company in the manufacture of its parts, such as transmitters, ringers, receivers, etc., is well known, and the same standard is set in the woodwork of the instrument cabinets, and in the arrangement of parts. Telephone men who are anxious to obtain information on the essential points about these instruments which give them long life and reduce maintenance expenses should write to the company for information.

FIRE AT FACTORY OF WIRE AND TELEPHONE COMPANY OF AMERICA WILL NOT AFFECT DELIVERIES.

THE fire which destroyed one of the factory buildings of The Wire & Telephone Company of America, at Rome, N. Y., on February 23d, will in no way interfere with the company's ability to take care of the requirements of its trade as heretofore. Owing to the resourcefulness and prompt action of the officers every provision has been made to make deliveries and to accept new business on all of the company's products.

The fire, which destroyed only the wire-drawing plant, was no sooner under control than arrangements were being made for the drawing of wire by other mills to fill orders. Representa-

tives were instructed to accept orders and assure customers of deliveries as though there had been no such misfortune as a fire loss. Buildings in which magnet wire, rubber-covered wire and telephone products are manufactured were not damaged in the least, and operations have been resumed. The Wire & Telephone Company of America has already made contracts for the erection of a new wire drawing plant, which will be pushed to the earliest possible completion, and will have a greatly increased capacity.

NEW YORK FIRM DOES MAIL ORDER BUSINESS IN TELEPHONE BLUE PRINTING.

VERY frequently it happens that a telephone company has need for from one to a couple of hundred blue prints from certain drawings or tracings. As the usual run of such work in each organization would not warrant the outlay for the necessary apparatus to do the work themselves, the H. B. CHRISTENSEN COMPANY, 33 Murray street, New York, has arranged to give special attention to the requirements of both operating and manufacturing companies engaged in telephone work. This company has exceptional facilities for turning out very high grade work, at low prices, and at short notice. As a general rule, the completed blue prints can be shipped the same day an order is received. Telephone companies planning new outside construction, either aerial or underground, securing rights of way for new leads, furnishing special instructions to outside foremen, inspectors and troublemen, etc., will find it to their advantage to correspond with the above company, and also manufacturing companies that have special work of this class to be completed at short notice.

The Christensen company can supply either the conventional blue print on linen or on paper, or a special black print on buff paper or linen. It is also the exclusive selling agent in this country for a special tracing paper of a light green tint, giving excellent results and selling at a price far below that of standard tracing paper.

THE STERLING ELECTRIC COMPANY, Lafayette, Ind., has an especially interesting piece of equipment in its "Army type" switchboard. The cabinet appears to be of a neat design and thoroughly well made, and is so put together as to facilitate the easy insertion or removal of apparatus. All apparatus is readily accessible for adjustment or repairs. Equipment may be readily installed at any time, the plan recommended being to buy a cabinet with an initial equipment sufficient to slightly more than cover the number of lines in use; then buy additional jacks, drops, etc., as required.

THE BLAKE SIGNAL & MANUFACTURING COMPANY, 246 Summer street, Boston, Mass., has in the "Blake Tube Flux," which under its new name has been recently put upon the market in an improved form, an especially interesting product. The flux is put up in a collapsible tube with a long aluminum spout. By the manipulation of the tube just the proper quantity of paste can be applied to the work during the process of soldering, and the spout enables it to be placed just where it isneeded. Owing to the fact that this spout is made of aluminum it can be placed directly in hot solder without becoming clogged. Full information will be furnished by the company on receipt of a request.

THE HALLETT IRON WORKS, 92-96 W. Polk street, Chicago, Ill., is making large sales of its standard materials for outside construction. Cable reel jacks and bars, alley arm braces and other classes of iron work used in telephone construction which this company sells have become thoroughly established in the market and won a high reputation for quality. A complete list of the company's products with any desired information will be sent to telephone managers upon request.

THE STROMBERG-CARLSON TELEPHONE MANUFACTURING COMPANY, Rochester, N. Y., reports contracts closed for switchboards since February 1st as follows:

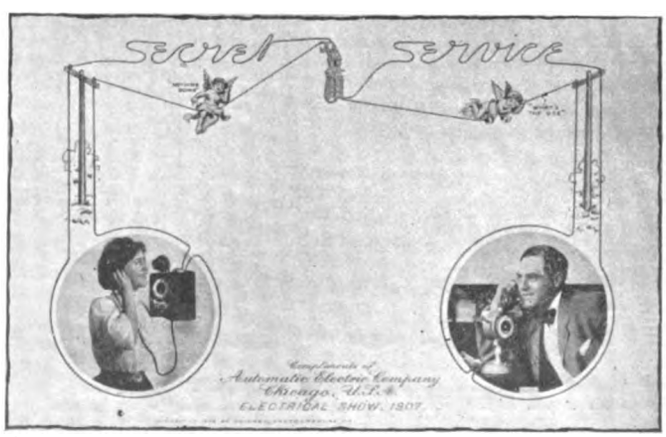
Central Energy Multiple Switchboards: One 6-position multiple switchboard, 2400 ultimate, 500 equipped, Mart, Texas. *Central Energy Private Branch Exchange Switchboards*: Rome, N. Y.; Rockford, Ill.; Waco, Tex., 2; Rochester, N. Y.; Louisville, Ky.; Minneapolis, Minn., 10; Lincoln, Neb.; Toledo, Ohio; St. Petersburg, Fla.; Port Jefferson, N. Y.; St. Anthony, Idaho. *Generator Call Switchboards*: Marion, Ill.; Carrington, Mo.; Bloomington, Ill.; Aviston, Ill.; Tonopah, Nevada; Somers, Ia.; Byron, Ill.; Odelbolt, Ia.; Fairview, Nevada, 2; Garrett, Pa.; Salisbury, Pa.; South Whitley, Ind.; Glouster, Ohio; Irvington, Ky.; Norway, Ia.; Lewistown, Mont.; Aurora, Neb. *Machine and Power Equipments*: Fairmont, Neb.; Geneva, Neb.; Rome, N. Y.; Toronto, Can., 2; Rochester, N. Y., 2; Nacogdoches, Tex.; Birmingham, Ala.; Olathe, Kans.; Port Jefferson, N. Y., 2.

Telephone orders have been received in good numbers. One order of fifteen hundred telephones was recived last week wjth others and sales are said to be increasing daily.

THE AMERICAN CONDUIT COMPANY, New York City, has just issued a leaflet which gives some interesting information concerning concrete. It shows the amount of material required for a cubic yard of concrete made with different proportions of sand, loose gravel and cement. This table should be very useful to those who have occasion to compute volumes of this material, and as its use in connection with buildings, underground work, and other structures owned by telephone companies is rapidly increasing it should have a practical value to many telephone men. A copy will be sent on receipt of a request.

DAVID SCOTT PLUME, who was treasurer of the Plume and Atwood Manufacturing Co., Waterbury, Conn., died on Feb. 19th. His many friends learn with regret of his loss, and extend their sympathy to the company with which he had been connected since its organization.

THE AUTOMATIC ELECTRIC COMPANY, Chicago, Ill., distributed at the Electrical Show a card of which we present a reproduction on this page. On the reverse side was a regular post card heading, so that visitors might send it out to their homes. It is seldom that a manufacturing company produces so attractive a design as this, and it won the most favorable comments from all who had an opportunity to see it.



Exceptionally Attractive Postal Card Distributed at the Chicago Electrical Show by the Automatic Electric Company.

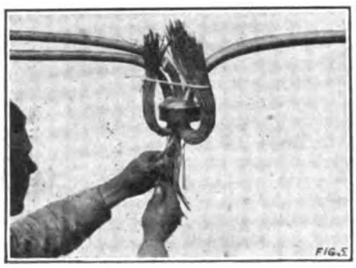
A MONEY SAVER



A MONEY SAVER

YOUR TIME

will earn money in direct proportion to your use of it. The use of the Hargis Cable Splicing Joint will enable you to save time. It will enable your regular linemen to make a better splice than an expert cable man. The picture above shows how easy it is to splice pairs by means of the Hargis Joint. They can all be tied out of the way while the splicing is going on.

The Hargis Joint is not a wiped joint in any sense of the word. The cables are simply put thru the cap and lead gasket and the lead is then poured in until the cup formed by the gasket and the brass cap is full. What wiping is done is simply to smooth off the rough edges, and does not add to the weather-resisting qualities of the joint.

HOW TO SAVE YOUR TIME

Let us send you descriptive matter of the Hargis Cable Splicing Joint shown above. By its use you can make a better splice in less than one half the time it takes to make a horizontal wiped joint, and at the same time you can always get into it by means of special tools to test out for trouble along the line.

It will pay you to write for our descriptive matter.

THE WEEK'S MESSAGES

NEW COMPANIES.

SIERRA MADRE, CAL.—Articles of incorporation have been filed by the Sierra Madre Telephone & Telegraph Company, and the following directors elected: W. E. Farman, J. M. Baldwin, F. N. Hawes, C. S. Kersting, H. I. Thomas. It has a capital stock of $50,000, of which $5,000 has been subscribed.

MARSHALL, ILL.—The People's Mutual Telephone Company, of Marshall, has been incorporated with a capital stock of $5,000. The incorporators are Jas. Davison, Jas. Pickens, and John Welsh.

SOMONAUK, ILL.—An Independent telephone company has been organized at this city, and a franchise granted. The company will be known as the Farmers' Telephone Company.

LAPORTE CITY, IA.—The La Porte City Farmers' Mutual Telephone Company has filed articles of incorporation, and contemplates the erection of a telephone system and the establishment of a modern exchange at this city. The capital stock is placed at $24,000. A. A. Sloan is one of the incorporators.

MERRILL, IA.—The Farmers' Mutual Telephone Company has been organized at Merrill, and the following officers elected: Wm. Lindsey, president; F. Susmihl, secretary; P. Erpelling, treasurer.

PAULLINA, IA.—The Paullina Telephone Exchange Company, with a capital stock of $6,400, has been incorporated by G. W. Lyons and others.

PRINCESS ANNE, MD.—A Farmers Telephone Company is being organized by F. B. Allen and D. E. Peters to construct lines between Princess Anne and King's Creek.

TUSTIN, MICH.—The farmers west of Tustin have organized an Independent telephone company, which is to be known as the Maple Ridge Telephone Company.

STILLWATER, MINN.—A new rural telephone company has been organized by the farmers along the St. Paul and Hudson road, and the following officers elected: Patrick McDonald, president; James Sinnott, vice president; Geo. F. V. Vollmer, secretary-treasurer; A. Richard, J. Cappler, John Mackey, directors.

WINONA, MO.—Articles of incorporation have been filed by the Current River Telephone Company, of Winona. It has an authorized capital stock of $10,000, and the incorporators are J. V. Chilton, John Church, James Holland and others.

RENO, NEV.—In order to break up the monopoly of the Pacific States Telephone Company in Nevada, the local business men have organized the Independent Home Telephone Company, with a fully paid up capital of $100,000. Richard Kirman, president of the Farmers & Merchants National Bank; W. J. Harris, manager of the Tonopah Banking Corporation, and F. A. Bonham are among the incorporators. The new company will at present consider the installation of a system in Reno, but will later extend its lines throughout the state.

ROCHESTER, N. Y.—The Police and Fire Alarm Telephone Company, Rochester, N. Y., has been incorporated with a capital stock of $500,000. The directors of the new company are G. F. Roth, C. P. Chapin, J. L. Hotchkiss, Merton E. Lewis, C. W. McKay, Rochester.

CARDENAS, N. C.—Articles of incorporation have been filed by the Cardenas Telephone Company, whose intention it is to construct and operate telephone lines in the vicinity of Cardenas and other points. It has an authorized capital stock of $100,000, and the stockholders are J. M. Judd, B. W. Burt, S. J. Westhers, J. T. Judd, E. H. Ballentine, J. Y. Ballentine and J. C. Ballentine.

FAIRVIEW, OKLA.—The Fairview Southwestern Telephone Company has been incorporated with a capital stock of $1,000, and among the incorporators may be mentioned T. N. Case, J. W. Howard, J. J. Just and David Cornelson.

SEGUIN, TEXAS.—The Delany Telephone Company has been organized to operate in Seguin and vicinity.

SEGUIN, TEXAS.—A new Independent telephone company, to be known as the O'Daniel Telephone Company, has been organized at Seguin.

SHEFFIELD, TEXAS.—An Independent telephone company has been formed by the business men of Sheffield to construct a telephone systen. from this city to Ozona, a distance of forty-nine miles. The construction of the line will commence at once, and exchanges are to be established at Sheffield and Ozona. Among the incorporators are Garrett Bean, Ed. Miller, L. B. Adams, T. F. Hickox, D. P. Lyles and H. B. Bond.

LODORE, VA.—The Amelia and Powhatan Telephone Company has been incorporated with a capital stock of $5,000, and the following officers elected: O. C. Hooker, president; W. H. Graber, secretary and treasurer; J. E. Morris, J. O. Jones and J. Snook, directors. It is the company's intention to construct and operate telephone lines through Amelia, Powhatan, Chesterfield, Goochland and Henrico counties, a distance of about three hundred miles.

WYLLIESBURG, VA.—Articles of incorporation have been filed by the Wylliesburg Telephone Company, and the following officers named: C. B. Robertson, president; W. H. Owens, vice-president; A. H. Zollinger, secretary and treasurer; W. P. McGuire, general manager. The company has an authorized capital stock of $5,000, and it is its intention to build lines in Mecklenburg, Halifax and Charlotte counties.

BELLINGHAM, WASH.—A new rural telephone company has been organized and is asking for a franchise from the county for the construction of a line from Bellingham to Laurel and Ferndale. The name of the new organization is the Midway Telephone Company, and the officers are: Henry Richardson, president; N. C. Davenport, vice-president; Enos Strode, secretary; J. H. Oltmanns, treasurer.

FRANCHISES.

CARMI, ILL.—A fifty-year franchise has been granted by the city council to the White County Telephone Union. A new building is to be erected and the latest style switchboards installed.

ORLEANS, IND.—A franchise to construct and maintain a telephone system in the city of Orleans has been granted to J. P. Jackson.

MARION, IA.—The Farmers' League Telephone Company, which now has connections with Oraville, Mt. Pleasant, Murphysboro, Anna, De Soto and other places, is desirous of securing a franchise in Marion. If it is successful, connections will then be established with Herrin, Benton, Johnston City and other points.

LANTON, MO.—A ten-year franchise to construct and operate telephone lines from Lanton to Moody has been granted to the State Line Telephone Company.

BRENHAM, TEXAS.—The Navasota-Washington Telephone Co. has been granted a twenty-five-year franchise over the public roads from the Washington county line to Brenham, by the Board of County Commissioners.

DEEP CREEK, WASH.—A telephone franchise to complete its line to Medical Lake has been granted to the Deep Creek Telephone Company.

FINANCIAL.

BETHALTO, ILL.—The capital stock of the Star Telephone and Telegraph Company has been increased from $2,500 to $12,000.

HEBRON, ILL.—The Farmers' New Era Telephone Company, of Hebron, has increased its capital stock from $50,000 to $100,000.

FARMLAND, IND.—At a recent meeting of the Farmland Telephone Company, the capital stock was increased from $3,950 to $12,000, and an eight per cent. dividend declared.

MINNEAPOLIS, MINN.—The directors of the Tri-State Telephone & Telegraph Company have declared the fifteenth quarterly dividend at the rate of six per cent. per annum on the preferred stock of the company, and the twentieth quarterly dividend at the rate of seven per cent. per annum on the preferred stock of the Twin City Telephone Co., both payable March 1, 1907, to stockholders of record of February 18, 1907.

SEWARD, NEB.—The capital stock of the Seward County Telephone Co. has been increased from $50,000 to $100,000, and the board has perfected plans for the construction of several new lines.

OSWEGO, N. Y.—The Wiltseville Telephone Company has increased its capital stock from $480 to $2,010.

MARIETTA, O.—The West Virginia Western Telephone Company, which has established new exchanges at Sisterville, Friendly, New Mata-

NEWS—WANTED

THE matter contained upon the message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

Stribling; general manager, H. H. Henry. Directors: J. S. Spencer, E. J. Mossman, T. Stribling, Homer Smith and W. H. H. Gardner.

MISCELLANEOUS.

SANDUSKY, MICH.—Messrs Balhoff and Smalldon have acquired William Leggett's interest in the Sandusky Telephone Company.

GRANT CITY, MO.—Connections have been formed between the Grant City Telephone Company and the Farmers' and Merchants' Mutual Telephone Company.

PULLMAN, WASH.—The rural telephone line running from Pullman to Chambers, known as the Barbee-Fletcher line, has been sold to a company of farmers headed by S. H. Breeze. It is the intention of the new owners to extend the system to Johnson, Colton and other towns.

PERSONAL.

B. H. BROOKS, superintendent of the Citizens' Telephone Company of Columbus, Ohio, will sever his connection with that company March 1 to take the position of engineer with the Home Telephone Company of Detroit, Mich.

A. B. CLARK has recently been appointed manager of the Home Telephone Company at Lawrence, Kan.

J. P. GEMMIE has resigned as manager of the Gallipolis Telephone Company of Gallipolis, Ohio, to enter the equipment department of the Cuyahoga Telephone Company at Cleveland, Ohio.

E. J. HOLIHAN has been promoted from the management of the Holly exchange of the Michigan Telephone Company to that of the Owosso exchange.

CLYDE SMITH has resigned the position of switchboard foreman with the Cuyahoga Telephone Company of Cleveland to accept a position with the Home Telephone Company of Detroit, Mich. He will superintend all interior wiring done in that city.

New Construction in the Field

SANTA BARBARA, CAL.—The Home Telephone Company is building lines in Santa Ynez, Los Alamos and Los Olivos. Connections will soon be established between Santa Barbara and Santa Maria, and later on with Lompoc.

SISSON, CAL.—A telephone line from Sisson to Weaverville, by way of Trinity Center, is to be constructed by the forest bureau as part of the system of fire patrol.

GREEN RIVER, ILL.—Additional lines are being built by the Green River Telephone Company.

SYCAMORE, ILL.—Many new lines are being built by the Exchange Telephone Company.

ANDERSON, IND.—It is the intention of the Delaware-Madison County Telephone Company to erect a new exchange building at Anderson. Its entire system is to be rebuilt at this place, and new lines built in many directions.

CORYDON, IND.—It is the intention of the Eureka Telephone Company to extend its lines to all parts of Harrison county.

NEW HAVEN, IND.—Many improvements are being made in the plant of the Home Telephone Company, including the installation of a new switchboard.

HASKINS, IA.—New lines are being constructed by the Mutual Telephone Company.

CASS CITY, MICH.—Construction work upon the system of the Cass City Telephone Company is to be commenced at an early date.

DEXTER, MICH.—The Mutual Telephone Company plans the construction of a line to Hamburg via Lakeland.

ALTAMONT, MO.—Among the improvements contemplated by the Altamont Independent Telephone Company is the erection of a line to Weatherby.

GRANT CITY, MO.—The lines of the Grant City Mutual Telephone Company are to be extended from Grant City to Worth.

RICH HILL, MO.—New lines are to be built by the Butler-Rich Hill Telephone Company.

EUSTIS, NEB.—A new metallic circuit is to be installed by the Eustis South Side Telephone Company.

DALTON, N. Y.—Among the improvements planned by the Livingston Rural Telephone Company is the construction of lines from Livingston to Portageville and other points.

MANCHESTER, N. Y.—It is the intention of the Ontario Power Company to construct a private telephone line on the right of way recently purchased in Manchester.

MARYSVILLE, O.—The Union County Telephone Company contemplates the erection of a new line from Marysville to Richwood.

NEWTON FALLS, O.—The Newton Falls Telephone Company, among other improvements, contemplates the building of a direct line to Warren via Leavittsburg, and two party lines out of Newton Falls.

EMAUS, PA.—New wires are being strung by the Consolidated Telephone Company in Emaus.

HUNTINGDON, PA.—A new switchboard is to be installed by the Huntingdon & Clearfield Telephone Company, and the entire local system materially improved. New lines are also to be built.

MT. PENN, PA.—The Consolidated Telephone Companies of Pennsylvania are building a new line through Mt. Penn.

PORT TOWNSEND, WASH.—The Independent Telephone Company, a corporation composed largely of local interests, which has recently established connections between Port Townsend and Port Ludlow, is now at work on a line to Seattle.

WEBLAKE, WIS.—It is the intention of the St. Croix Mutual Telephone Company to construct lines from Weblake to Orange, Gordon and other points.

VEGREVILLE, ALB., CAN.—The town has applied to the provincial government for information and assistance towards building a municipal telephone system. Address F. A. Morrison.

FORT WILLIAM, ONT., CAN.—The town will spend $26,000 this year in improving its municipal system. Address Mayor Routledge.

UNDERGROUND.

MT. PULASKI, ILL.—Considerable conduit work is being done by the Mt. Pulaski Telephone Company.

JUST A SUGGESTION

Take one of your busy 4-party lines and equip it with "POOLE" Lock-Outs. Leave it in service a month and then see how many of the four will stand a raise of $3.00 a year rather than go back to the old way. We know the answer, but we want your subscribers to impress on you the fact that the "POOLE" Lock-Out is a rate-raiser.

It won't cost you anything to try it, because we will loan you the Lock-Outs free and there is no other equipment required. Write today for our Booklet AL-2.

DEAN TELEPHONE APPARATUS

Selective Party Line Express Type Switchboards

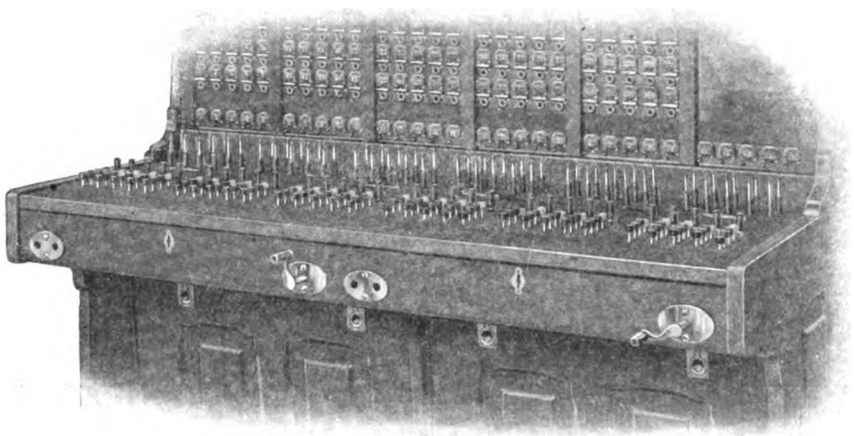

Fig. 1 of the accompanying illustrations shows the Dean four-party indicating and single listening key which shows the simplicity of its construction. When this key is mounted in the switchboard key shelf the only contacts hidden are those of the normally opened variety—few in number and the kind that never give trouble.

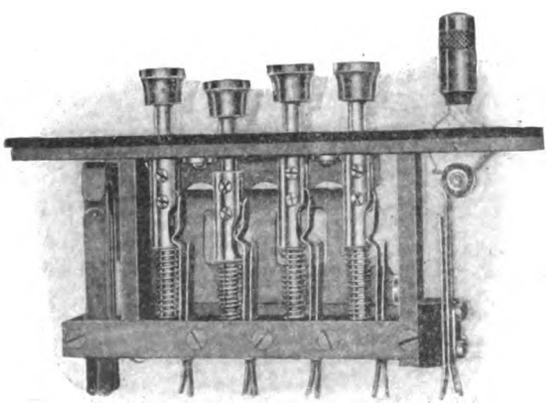

FIG. 1.

The only contacts in the talking circuit due to this key are mounted at the front of the construction, in plain view when the shelf is open.

This is the kind of simplicity which makes our complete selective party line system reliable in every sense of the word.

The switchboard key shelf shown herewith illustrates the simplicity of accurately operating each cord circuit with an indicating ringing and listening key, which permits the last key operated in any cord circuit to remain in a depressed position. Thus it is only necessary for the operator to reoperate the depressed key for the second call on the same circuit.

For additional information concerning the many valuable features incorporated in the various types of our express switchboards ask for our No. 6 booklet.

Stromberg-Carlson Telephone Mfg. Company

Rochester, N. Y. March 9, 1907.

TO THE EXCHANGE MANAGER AND TELEPHONE USER:

After five years' experience in the manufacture of various forms of cords, we believe we offer an article of the highest quality and greatest utility.

Every cord has an important function to perform as part of the switchboard and telephone. Therefore every kind of thread, every weight of copper tinsel and every size of brass or steel wire used in STROMBERG-CARLSON cords is of a selected quality, size and strength that will satisfactorily produce the strongest cords of the least ohmic resistance and greatest conductivity

The STROMBERG-CARLSON method is to begin with the materials in bulk forms. We personally supervise the first important operations of selecting, sorting and cleaning all material perfectly. By maintaining a modern equipped dyeing and drying department, we produce perfectly finished products.

STROMBERG-CARLSON Standard Receiver and Desk Telephone Cords may be used with all forms of apparatus. We also make special cords of the same construction, designed especially for use with dental machinery, testing apparatus and other apparatus.

We solicit correspondence pertaining to all forms of cords for this work.

In our next letters we will describe the STROMBERG-CARLSON tinsel and steel type Switchboard Cords.

While you are thinking about buying, may we present our samples and NEW PRICES?

Yours very truly,

Stromberg-Carlson Tel. Mfg. Co.

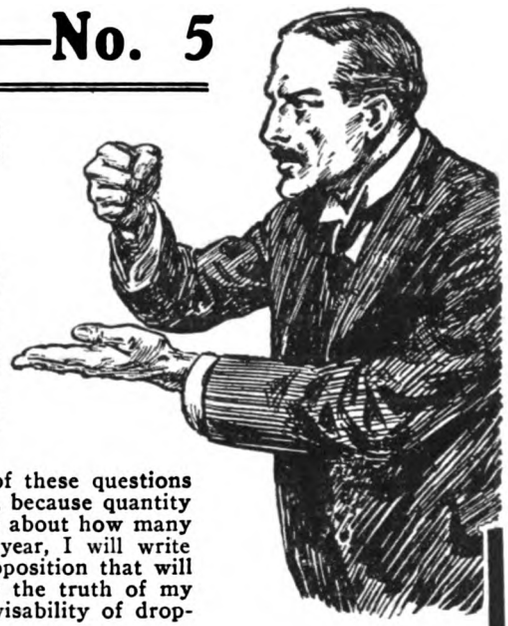
Talks With The Buyer—No. 5



I am not doing a monologue act with these talks. Perhaps you can't hear the other buyers talking back, but if you could see the letters, questions asked and orders received, you would fall in line.

A Word About Telephones

One man wrote: "What does the word 'Telephone' stand for in your name? Do you make telephones?" A natural question. A helpful suggestion. I have been so enthused over the especially attractive "supply" offerings that I have not emphasized our position as telephone manufacturers, our ability to furnish absolutely high grade equipment and at attractive prices. There are over a hundred manufacturers of telephone equipment in this country. Half of them are soliciting a share of your orders. Some exchanges have samples of at least a quarter of the number. At times you wish there were only two or three in the business. You ask: "Why should I buy 'Central' 'phones? Do they make their own equipment? Are they offering a supply house, 'mail order' grade or High Grade 'phone? Can they give me the quality that I require? Have they the factory facilities for making such prompt deliveries as I demand? Wherein is their proposition different from any one of a dozen presented to me?"

You can readily see that in this half page I cannot answer all of these questions satisfactorily either to you or to me, nor can I very well quote prices, because quantity and your individual requirements govern the case. If you will tell me about how many 'phones you are going to purchase in the next ninety days or one year, I will write you a personal letter by return mail and will make you a special proposition that will be well worth your while to entertain, submitting samples to prove the truth of my statements. Does not your good business judgment suggest the advisability of dropping me a line now before you put this paper away?

Laying the Hadlyme Submarine

By John Putnam.

Illustrations from Photographs by the Author.

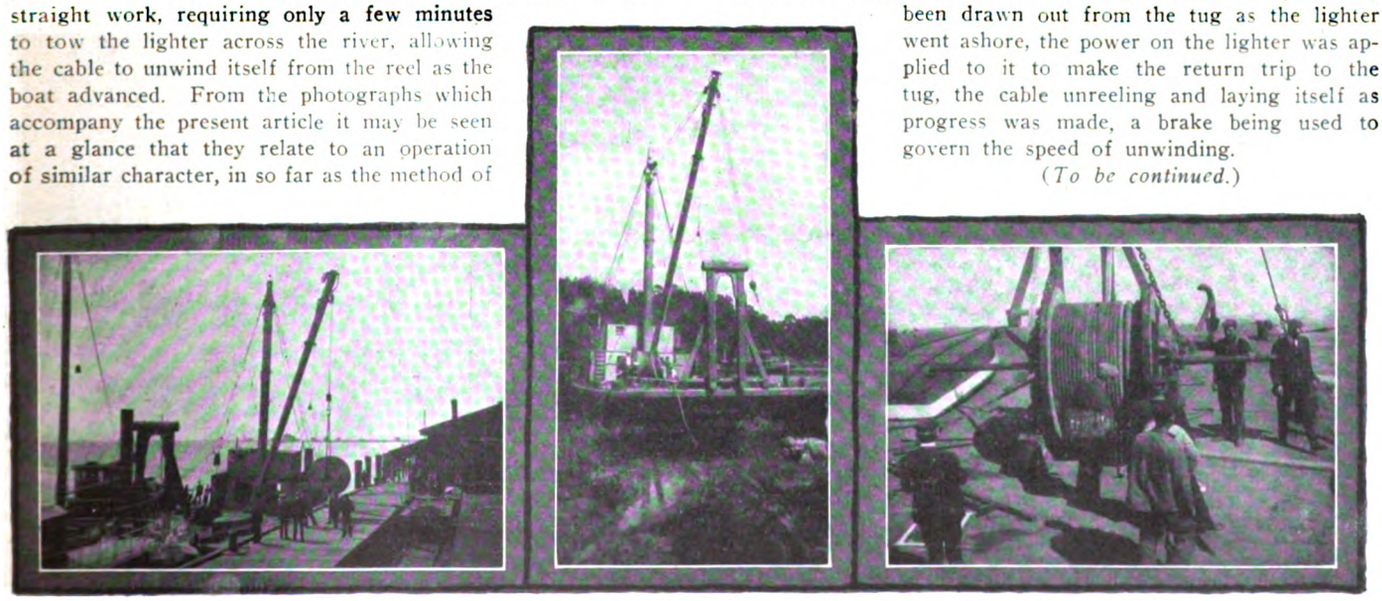
DURING the progress of the work of making extensions of the telephone system which serves the country on both sides of the Connecticut River, and along the inlet-indented shore of Long Island Sound, submarine cables have been laid from time to time, and in a large number of widely separated locations. Each separate length of cable has been laid under circumstances causing interesting variations, at least in detail, from the methods used in earlier instances when it was necessary to carry a group of telephone conductors between two opposite shores. Such variations have been due, in the main, to differences in environment—as, for instance, that existing between a salt water inlet and the river, the varying depth of water, the availability of surrounding objects on shore as auxiliaries, and the considerations which determine the most suitable method of carrying the free end of the cable across the water, after one end has been fastened on shore. Questions of economy and progressive steps due to the improvement in the understanding of methods of handling this kind of work on the part of those under whose direction it was carried on, as the experience in earlier jobs was brought to bear, have of course had their effect in the later instances.

Last summer there were published in The American Telephone Journal two articles describing cable laying by different methods. One told how a cable was pulled across the Connecticut River at Middletown by a locomotive, and the other described the manner of placing a very heavy submarine at the bottom of the Thames River at New London. The cable at this place was transferred directly from the car to a lighter which was then towed by a tug to one of the established terminal points. After this had been reached it was a simple piece of straight work, requiring only a few minutes to tow the lighter across the river, allowing the cable to unwind itself from the reel as the boat advanced. From the photographs which accompany the present article it may be seen at a glance that they relate to an operation of similar character, in so far as the method of supporting the reel and conveying it from the wharf to the scene of action is concerned.

At Fenwick, near the mouth of the river, the cable was swung from the car to the lighter by a derrick, as shown in the first illustration. Through the middle of the reel was passed a steel shaft, the ends of which were supported on blocking, set firmly on the deck. With the reel of cable firmly secured there remained for the construction men nothing to do while the two-hours trips to Hadlyme was being made. The right hand photograph shows the reel on its blocking as it appeared at this time. The position of the reel of cable set up on the deck is clearly indicated, and the upturned rowboat is included as an essential part of the outfit, which will later find good use. The middle illustration shows conditions when the destination was reached, and it was then that the real difficulties involved in laying a cable at this point were seen.

The main channel of the Connecticut River at Hadlyme runs close to the east shore and in width extends from the shore to about the middle of the stream. This leaves a broad stretch of shallow water extending to the west shore, across which the tug could not go. The tug and lighter, carefully feeling their way by the lead, went to the west side of the channel, and the tug, being unable to go further without getting aground, cast anchor. A line was then taken ashore and fastened to a large tree. The aboard end of the line was passed around the drum of the lighter's steam winch, and she pulled herself to shore by her own power. Reference to the photograph clearly shows the situation, the lighter near the shore, the cable end passed to the land and ready for unreeling, while beyond the lighter the tug can be seen lying off in the channel of the stream. A rope having been drawn out from the tug as the lighter went ashore, the power on the lighter was applied to it to make the return trip to the tug, the cable unreeling and laying itself as progress was made, a brake being used to govern the speed of unwinding.

(To be continued.)



Transferring the Reel of Cable from Flat Car to the Deck of the Lighter. *Lighter Inshore, Tug in Midstream, Cable End Ashore, Ready for the Start Across the River.* *Cable Resting on Deck of Lighter During the Trip Up River.*

Independents until its resources are exhausted, but the governing law, which is a product of the industry itself, will remain just the same, and the faster the Bell buys up and tries to stifle its growth, the faster will the second telephone idea develop.

If you were a railroad man and had more freight to move than you could haul with one engine, would you not get two engines and make two trains out of it?

Now here is the startling fact that the writer is going to try to prove, and can prove, that the very nature of the business which would appear, on the surface, to make it necessary that there be a monopoly, is the actual condition that makes competition necessary. Further, it is this condition which has caused the tremendous development throughout this country of the so-called Independent telephone.

Do we suppose that three million Independent telephones have been put in operation in this country in the last few years simply on account of the public abhorrence of monopoly? Are we to suppose that this condition has come about simply because directing brains of the Bell telephone company have been actuated by mercenary motives so that an opening of such vast proportions has been left? Are we to assume that, although this condition exists to such tremendous proportions, there should be no need of its existence if the telephone business had been conducted along proper lines? All these are far from the facts. The Independent telephone exists to-day because of a condition that is natural in the business, and which is not controlled in any way, and cannot be controlled by the governing policy of any board of directors.

If all the Independent telephone companies of this country were consolidated with the Bell Telephone Company to-morrow, a tidal wave of competition would again start over the nation that would be more startling than even the present development. We have read, with interest, Martin W. Littleton's brief presented to the New York Board of Franchises in behalf of the petition of the Atlantic Telephone Company. We have read Harry P. Nichols's report presented to that same board. Yet, neither of these, or even other literature, has yet touched upon the real reason why competition exists, and why it will exist.

The Bell people say it is bad to divide the business in a city. Is there, in telephone history, a record of a city where competition exists where the Bell company has not to-day more telephones than it had when competition started? Then, their business has not been divided, but added to.

In no place in the world is competition more necessary than in New York City, and that competition is, after all, not made necessary because the Bell telephone company is charging exorbitant prices, or because it is not developing a field that it could develop, or because the New York Telephone Company is not conducted on business lines. Competition is necessary, or rather two telephone systems are necessary in New York, and in any city, to develop a field that now exists undeveloped, and will remain so under one system, because it is impossible to attain the highest state of development under one operating unit.

It is a fact that the cost of operating, per telephone, increases with the growth of a system. It is a certain fact that the cost of handling each message over a telephone costs more as the number of telephones in a system grows. Now, if the cost of operating a telephone increases as the number of telephones in a system increases, then the charge made to the subscribers for that service must increase, and it has been and is increasing.

Now, if ninety per cent of the people of New York City, or any city, are to-day without telephone service, it is natural to assume that they are without it on account of the cost. Then, if this is true, how in the name of all that's reasonable is the ninety per cent going to get any closer to telephone service if the cost of the traffic is continually increasing as the system increases numerically? That ninety per cent is getting farther away from it every day, and the New York Board of Aldermen may study and debate for all time, and that condition cannot be changed so that one system can take care of the entire business. The only thing that will change the condition is invention or improvement which will reverse the now governing law of the industry that the cost to the subscriber must increase as the subscribers increase numerically.

The Bell telephone company has been increasing its rates everywhere since the starting of the business. It has apparently realized vaguely, and does now, that this law of increase in rates in proportion to numbers governs the art, and has been trying to combat and counteract the law in different ways. One of the ways was to introduce measured service, decreasing the cost of the instrument, but increasing the cost of the traffic, or message sent from the instrument. It has tried other methods by departing from the exclusive line service to party line service, where one individual line can be made to bring in a greater revenue, and yet represent a lower cost to the user; by limiting the use until, to-day, in the large cities, it charges a low price for a telephone with an absurd price for the calls over it, and all in an endeavor to counteract that governing law of increased cost with the increase in numbers.

This increase in cost it attempts to justify by the assertion that as the number of telephones increases, so the value of each telephone increases to a subscriber. This is not literally true. There is not a subscriber in New York City who uses, or has any use for, two per cent of the entire number of telephones in that city, and yet each subscriber is compelled to pay a price made necessary through the fact that it is possible for him to connect to the ninety-eight per cent to whom he never talks, and probably never will. You will say at once that this is absurd, and that it would be an impossibility to limit a subscriber's connecting possibilities to only those stations with which he communicates. This is very true, and until that very apparent impossibility is eliminated by the process of invention, or the increased cost of each station, as additional stations are added, is eliminated by the advent of improvements, we shall see in force the natural law which says two systems are necessary. So two systems will exist, and two systems must of necessity be in operation before the development of the telephone service can be carried to anywhere near the point that it should reach in a city.

Practically all the largest cities of this country have granted competitive franchises. Are we to suppose that they were all granted just because the existing telephone companies did not behave themselves, and that there was no deeper basis for the action than that? Does the New York Board of Aldermen assume that all the cities of the country have made a vast mistake and New York alone stands correct? Does Mayor Fitzgerald, of Boston, suppose that practically every legislative body in the United States is wrong and that he alone is right when he vetoes the Boston franchise? It would seem so, but these franchises have been granted, the industry has grown, others will be granted, and the business in the new places will continue to grow, because the laws of the business demand it. That law which is accountable for under-development where there is only one system cannot be changed by the polished writings of G. W. Anderson, the Boston lawyer; by the volumes of statistics compiled for the edification of President Fish, of the Bell telephone company, and his board of directors; by the veto of Mayor Fitzgerald; or by the inspired Merchants' Association report. Every city and municipality in this country will have telephone competition, and the artificial barriers erected by legislative bodies cannot withstand continually against the natural law of the business itself.

The value of a telephone is not necessarily directly in proportion to the number of other telephones that can be reached by a particular instrument, but that telephone is the most valuable to a subscriber which supplies to him the greatest percentage of responses to the demands that may be made upon it. As an illustration:

The subscriber in a little village to a system of thirty or forty telephones will be able to derive greater relative personal benefits from the use of his telephone at one dollar per month than will the subscriber in New York City get from his telephone with its three hundred thousand connections, if it is a fact that the percentage of population reached in the village by the little tele-

Digitized by Google

phone is greater than the percentage of population reached by the New York system in comparison with the total population of New York. The real value of a telephone does not necessarily depend upon the number of telephones reached, but depends to a greater extent upon the percentage of people reached in a community. If, in the little village, the farmer's telephone reaches fifty per cent of the population of that village, and the telephone in New York City only twenty-five per cent of the population in New York City, that telephone in the village is relatively twice as valuable as the one in New York City, and yet the subscriber in New York has to pay ten times the amount of money for his instrument.

Now we come to the real basis of the problem. We will assume that the percentage of the people, or residences, in New York City without telephones is ninety per cent, and it is reasonable to assume that they are without telephones on account of what is to them a prohibitive price. When the price per telephone message, which is the real basis for the charge, is increasing, is not the right and privilege of using the telephone getting further away from that ninety per cent of the population instead of getting closer to it? Is not that very undeveloped field the opening for the Independent telephone? Is it not just such a field that has first been developed by the Independent telephone companies over the entire country? Who ever heard of the Independents growing in a very large city and the Bell absolutely going backward? That undeveloped field is now in New York City, and will continue to remain in New York City just so long as only one system exists. The development of that field does not depend on what the Board of Aldermen say, or what inspiration the Merchants' Association may have on the subject, but on how long the people are going to stand for it.

The permanent development of a single telephone system in a community will depend upon the increased population of the wealthy in that community more than on any other reason. Of course, temporary relief may have beeen brought about, and is being attempted, by the introduction of party lines, so that the increased cost is subdivided among a number of subscribers, and also by the introduction of a measured service system, whereby the cost of the telephone instrument is reduced to the subscriber and the price added to the message, thereby limiting the use of the service so that an apparent reduction in the price of the telephone may be displayed to the people. Another way is by the introduction of the slot machine in residences, which may make it possible for more people to have telephones, but it does not decrease the message cost. After all, the telephone instrument is not the valuable part of a telephone system to the subscriber, but rather the message, and this temporary development is the spreading of the telephone instrument being paid for by the increase in price imposed on the telephone message. This is only a temporary relief, and the telephone engineers know it. The cost of a telephone message to-day is greater to the subscriber in New York City, and also to the company, than it ever was before. Too many people reckon cost from the telephone instrument rather than from the standpoint of the message. The housewife in New York City telephones to her grocer just across the street, and the cost of that call is far out of proportion to what it should be, because the housewife's telephone is part of a mammoth system.

The greatest development where a single system is operating in a city has been brought about through the introduction of party lines, which serve primarily to decrease the cost of a telephone per subscriber without decreasing the actual line revenue. That, however, is a temporary relief, so that it is an absolute impossibility, through the nature of business, for one telephone company to supply the demands made upon it in a large city, and this condition makes it absolutely necessary to have a second telephone company.

Now comes the question of the business man who says he does not want two telephones. This is almost too absurd to admit of discussion. The business man does not have to have two telephones if he does not want them, and never yet has a business man had the one telephone he is using deteriorate in value, or in range of connections, because a second has come in. He is not worse off because the present limit of his service is not subdivided, and he has the added advantage of competition in the regulation of ills. Furthermore, if a subscriber had a telephone on one system that was numerically as large as the two systems would be combined, then the cost of that one telephone would be as great as the cost of the two under separate systems. In addition to this, it would be a physical impossibility for one system to develop as one unit to as great proportions as the combined development under two units, because, on account of the increased price necessary for each telephone under the one unit, the service would be prohibitive to a large percentage of the people who have one telephone under two operating units.

Now, what is the solution? Here's a suggestion: After the Bell interests get tired of buying up Independents and find that it is impossible to eliminate opposition in that way, and after the Independents get over thinking that the Bell is a heartless octopus and must be obliterated, then the two interests will begin to look at the situation in a sane and reasonable manner and from a business standpoint. From that moment real, solid and lasting development will take place on a sane and practical basis, and it is quite likely that after a suitable understanding of the requirements of conducting the business, and a high state of development have been reached, intercommunication between competing systems in a city will be brought about on a small toll basis. Thus a subscriber to one system may be able to communicate with a subscriber on another system by the payment of a toll, which is a source of revenue in exchange for a convenience that both interests are now overlooking in a strenuous business opposition which, without doubt, is resulting disastrously to both companies in many places. When this condition is reached, and only then, may come about a consolidation of all long distance lines, and they will class themselves as common carriers, either by their own initiative or by legislative persuasion. Business will be accepted from and transmitted to any company, whether Independent or Bell, so long as that company complies with reasonable regulations necessary to such a condition. Then the real development of the telephone service will commence, and the disastrous policies now a part of the management of both interests will be a thing of the past.

ROONEY'S PAY STATION SIGN.

THE Doan Exchange manager at Cleveland, O., received a complaint from Benfield's pharmacy recently to the effect their pay station sign was not large enough to be conspicuous. The manager, on referring to the record, found that the large square sign was supposed to have been installed, but he questioned Troubleman Smith, who said that he distinctly remembered having seen the small oblong type over Benfield's entrance. While this matter was being talked over, Line Foreman Rooney reported in by telephone.

"Where are you talking from?" inquired the manager.

"Benfield's dhrug house," replied Rooney.

"Well, that's very fortunate," said the manager, "as we can clear up a matter we have under discussion. Did you notice the sign over Benfield's door, Pat?"

"I did thot," responded Pat.

"Well," continued the manager, "Smith says it is a rectangular sign, but our record shows differently."

"Will, I should hope it would," answered Pat. "Phwat's thot Smith said it were?"

"Rectangular," repeated the manager.

"He's a loir," promptly asserted Pat. "It's a pay station sign, thot's phwat it is."

BOSTON BELL COMPANY ANNOYED BY INVESTIGATION AND PUBLICITY.

INSIDE history of many of the deals made by the Bell company operating in Boston makes very interesting reading, but the officials do not like to see it printed. The hearings before the Massachusetts Highway Commission give the newspapers an opportunity to bring out many damaging facts.

Rural Party Line Ringing Codes

AMONG the numerous replies to a request for information concerning ringing codes for rural telephone lines, the following describe plans which show features which are likely to be especially interesting from one point of view or another.

From Elmer Koontz, Walkerton, Ind., comes the following information:

"In our code the number designates the line or drop number, and a letter gives the number of rings, determined by the telegraph code. As we limit the number of subscribers on a line to ten, that is the number of letters we use in making up the code.

36—H · · · ·	36—D — · ·	36—K — · —
	36—U · · —	

Table 1.

"For the information of the operators we write out the code on a slip of paper, which is posted in front of the operator at each switchboard position. They soon learn the code, and do not need to refer to the slip when a call comes in. The code may be tabulated as in Table 1, line 36 being taken as an example.

"We use the letters for each party, beginning at the one nearest the central office, in the order shown in the table, and by referring to our record can see where each party is on the line.

"Subscribers are not furnished with the code. If any person wishes to call a person on his own line with whose ring he is not familiar, the operator tells him what to ring."

A code using numbers to designate the rings, which must be memorized by the operator, has been arranged by George E. Shoemaker, proprietor of the Lancaster and Cedarville Telephone Exchange, Freeport, Ill. The code covers a very heavily loaded line by a very simple plan. The ring number follows that of the line, separated from it by a dash. The plan as worked out for 36 parties is shown in Table 2.

A description of a simple code which has given very good results is contributed by Clarence King, of Machias, N. Y., as follows:

"Our system of call signals is so devised that they may be easily used in directory, and each will indicate the line and ring. The operator has nothing to learn, the calling party telling exactly what to ring and where. Our lines are numbered to correspond to the drops, in the usual way, and this number in the directory is followed by a dash to separate it from the ring number.

"The rings are shown by figures and letters, the figures in-

Table 2.

dicating short rings and their number, while the letters each mean one long ring. We use the letters *a* and *b* and the figures 1, 2 and 3, but 4 and 5 can be added if the number of subscribers on the line requires it. We do not wish any call to exceed four rings if it can be avoided. Now, 10—2 by our code means two short rings on circuit No. 10; 14—ab1 means two long rings and one short one on line 14, and 27—a2b means one long ring, two short ones and one long on line 27. Where two long rings come together one letter might be dispensed with by having *b* stand for two long rings, leaving *a* for one, but this makes a little more to remember, and we prefer to use both letters."

Nelman F. Wing, secretary of the Farmers' Telephone Company, Grass Lake, Mich., writes as follows:

"We always use a long ring first in our code because one is liable to not notice the short rings when given first, but the long ring, followed by the short ones, attracts attention better. Each subscriber is furnished a card with the names and signals of those on his own line, like the form here shown. (Table 3.)

"If the switchboard drop number is 94, then these figures are placed in front of the number of each code signal on the line. Thus, if the subscriber's signal is one long ring, two short rings and one long ring, this is indicated by 10, and by placing the drop number 94 before 10 we have 9410, the subscriber's number. Our subscribers are educated to call by number, but not to say 'Nine thousand, four hundred and ten,' but to say 'Ninety-four, ten' or such other number as the case may be. This gives each subscriber on a party line a number in four figures. For this system drops from ten to ninety-nine should be used."

ENGLAND'S TELEPHONE DEVELOPMENT ADMITTED TO BE FAR BELOW THAT OF UNITED STATES.

JOHN ARDRON, assistant secretary of the British Post Office in charge of telephones, in a recent interview with the London *Mail* gave some interesting information about the telephone development of London and Great Britain. His statistics were for January 1, and show that in London, with an area of 640 square miles, at the present time there are 130,000 telephones, with a constant addition of new subscribers at the rate of about 10,000 a year. Ninety thousand of the total number of London telephones belong to the National Telephone Company, and 40,000 to the London Postoffice. In Great Britain, outside of London, there are 260,000 telephones, 250,000 belonging to the National Telephone Company, and 30,000 to the Postoffice.

These figures show that the use of the telephone is far from being as extensive, in proportion to the population, as it is in America. Not only is this true of the present development, but the rate of growth is lower.

Mr. Ardron admitted that America is far ahead in telephone development. "Norway and Sweden," said he, "are ahead of us in proportion to the population, Germany is about equal, while France is behind. The United States, which has no Government service, is ahead of all."

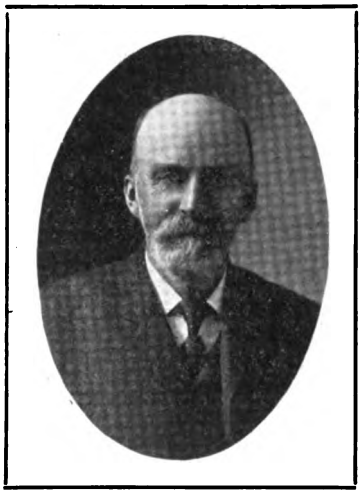
Dodging the Sub-License Contract*

How an Independent Company in Massachusetts Has Kept Clear of Bell Entanglements, and Thereby Prospered.

By W. E. Kinsman.

ABOUT ten years ago we organized an association and completed a grounded line fourteen miles long that cost $3,780. We had eighteen telephones on it. There was never seen a company of people so pleased with anything as were those eighteen subscribers with their line. They are very much the same to-day. They were nearly all farmers, and when they got their chores done they stepped to the telephone to talk with the seventeen other subscribers. All went into it to have what fun they could, telling stories, visiting, asking conundrums, and doing nearly everything a man could do over a telephone through the evening until they got tired, and one by one dropped off the line for the night. That made them so pleased with the use of the telephone that they were very enthusiastic, and at the first annual meeting it was voted to extend the line to Shelburne Falls.

Next year we began to be a little frightened because every dollar an association has in Massachusetts is held for the debts of the association. The Bell people were frightening us and we were afraid of them. In order to protect ourselves, we got incorporated. Then our friend, the representative of the Bell company, Mr. Story, came to us and said, "We want you to be a sub-licensee. We always take good care of our sub-licenseees. We do everything for them we can." He was as nice a representative as any you ever saw. You would think they loved us to death. He came to address us. He can talk. He is a smart man. At the close of the meeting he would rent us telephones for $5. The stockholders voted to turn down the proposition. Mr. Story then told a different story: "You won't amount to anything anyway. You don't begin anywhere, you don't end anywhere. You can't live. I give you just two years to fail up. You have got to get out of Shelburne Falls."



W. E. Kinsman, President, The Heath Telephone Company, Heath, Mass.

We had sixteen telephones in Shelburne Falls. They had thirty-six. "You'll have to get out of Shelburne Falls or suffer the consequences," he said. We told him we would stay and suffer. The Bell company now has forty-eight and we have one hundred and fifty-seven telephones in that town.

When we got to Shelburne Falls we were $1,300 in debt. We could not sell a single share of stock, so the directors gave their personal note for $1,300, letting it lie until the plant had paid for it. We carried that $1,300 until we could sell stock. We declared a 10 per cent. dividend. The Bell representatives say "borrowing money to pay dividends." We were paying that dividend with less than one-fourth rent. The next year we declared 10 per cent. Bell people say we were selling stock for a dividend. This created a demand for our stock, and the demand has been steady ever since.

In the meantime comes our friend, Mr. Story, again. He wants us to have a sub-license from the Bell. He told us the advantages coming to us if we would join. We turned him down. He told us we could rent the telephones at $3; came down on his price. We thought we would wait a little longer and perhaps we could get them for nothing. A year ago this winter he wanted us to come to Boston. They would pay our expenses and entertain us. "We want to show you what we have got." I have never gotten over being afraid of the Bell people. We could not possibly leave our business at home and they kept after us until about a year ago, when we met them at Greenfield. We had a session with them. We were surprised at the proposition they had to make to us to buy out their local lines on the ground that we occupied in common. We decided that we would investigate the matter and they sent engineers to appraise their property. We had another conference with them after they had made their estimate. It was tremendously satisfactory. Of all the territory they had cut out about half that we had asked for. They would sell to us and take it up in stock. But we could not extend our lines anywhere except where they said we might, and we must use their transmitters and receivers. We were to pay $1.25 a year in advance for their use. We declined to make the deal.

To show what they can do in a case like that, here is what happened in another part of their territory. There was organized a new company in the Deerfield Valley, and it occupied a few towns in Vermont, and the Bell people were also there. Their rates were $18 for each township. It was made $18 for all townships. Here is an instance where in nine towns in Massachusetts they give connections with the whole territory for $18. It is quite a reduction. They sent expert canvassers into our territory to talk with our subscribers. Well, they have just about six of our subscribers at the present time in the territory that we have lost because of the lower rates. The Bell have in our territory 248 telephones; we have 893 in Vermont and Massachusetts.

Our telephones are increasing. We have one telephone for ever 13.99 inhabitants. The Bell people have one for every 43.96 people. Taking out the two towns we have just entered, we are furnishing telephones in the ratio of one to every 12.87 inhabitants. We were never in a more prosperous condition. Everybody seems to want a Heath telephone. Our stockholders are largely our patrons, and they own a controlling interest in the company.

It may help some new company just organizing to know what we did to keep the control of our company in our own hands. About the time we organized the company there was one at Northfield. It was furnishing service at $15. The Bell people quietly bought the stock until they had a controlling interest, and they called a meeting to continue at $15. They also voted to be a sub-licensee of the Bell company. We took counsel as to how we could keep our company out of their hands, and on the face of every certificate there is a clause which gives the company the first right to buy if stock is to be sold. We sometimes exercise this right. One gentleman sold his share of stock to a neighbor. He had gotten into debt, and so sold it. We took the stock and later sold it ourselves, but it was not for this express purpose that it was put in, but the clause was put in to keep the Bell people from getting an opportunity to buy our stock.

* Editor's Note.—The article on this page is an abstract from address delivered at the recent convention of the Vermont-New Hampshire Association.

CHICAGO TELEPHONE OPERATORS DEMONSTRATE COURAGE.

FIRE broke out a few nights ago in a building very near to one of the principal exchanges of the telephone company. While many girls were at work at the switchboard the operating rooms became filled with smoke. The fire burned briskly at a distance of only a few feet from the telephone building for some hours before it was under control. Firemen came into the operating rooms of the telephone company, and were astonished to find the girls working almost as calmly as on an ordinary day. "How do these women manage to do it?" a big lieutenant asked. "It is discipline," said the manager. "I told them that I'd let them know just when it was time for them to get out, and they'll stick unless you fellows start something." "We'll not start anything with a bunch of girls like that," said the lieutenant.

THE EDITOR'S PAGE

WHAT DOES THIS SHOW YOU?

WHEN we invited our subscribers to help us out with information for a man who wanted to know about ringing codes for rural party lines we had no idea that we were going to get close to the hearts of so many good telephone men, nor would we have quite believed that our little request would bring out so many interesting and useful schemes. Of course everyone who, in the days when he first became acquainted with algebra, has juggled with various combinations of objects to prove to himself, by getting them all together before his eyes, that an almost incredibly large number of different groupings can be made by changing the relative position of units, must realize the possibilities which are open to the maker of ringing codes. Practically, however, most telephone men probably think that the conditions of operation are such as to limit the number of truly useful and convenient codes to a comparatively small number. That this number is by no means as small as is generally believed, however, we expect to show before our friends get through with the subject. This code business is a good deal like a puzzle, and enough men have worked it out to give a very pleasant variety to the answers.

Now we probably are as unwilling to be caught moralizing as our readers are to suspect such a thing. We are willing, however, to be taken on suspicion this time for the sake of emphasizing a point suggested by these replies. In fact, it is a thing in which we are so much interested that we can't help dwelling on it. When a man has to work out a problem, and does work it out and get an answer, he is usually enough interested in his result to want to know how it stands in comparison with what has been done by others. He likes to measure up and see if he can come out ahead. If he does, it is pretty satisfying, but if the other fellow has something better it can be adopted, and that helps the business.

When it comes to the actual process of measuring up, how is the man in California going to get next to the work of his neighbor in Maine? The question is not merely how can it be done, but how can it be accomplished most quickly and easily. Do we have to wait for an answer to this question? It's an easy one, isn't it?

Now to return to the rural line rings. We still have a good big pile of letters on this subject waiting for attention and more are coming every day. Some of those which have come in most recently give information which duplicates that in the earlier responses. But every point which is new and contains a useful idea we are going to publish. We haven't space for them all in any one issue, but they are all coming. When we get through with this we shall be ready for something else. This telephone industry is big enough to supply problems to keep before every man a goodly number of things about which he would like to acquire more information than he can easily dig up for himself. Also, the men in it are big enough and bright enough to supply information on every subject that comes up. In order to bring about results in this line it is necessary for someone to start the ball rolling; then let everyone who can jump in and give a good, hearty push. In this way telephone men can be sure of getting in touch with various classes of practical work in a most thorough manner. It means a chance to get information quickly, and cheaply, too. There is no reason why these things that interest us all should not be threshed out on the pages of a telephone paper as well as in a convention. Then, too, there is the advantage that once they are printed the statements from all over the country are brought together in permanent form. They can be read at any time. There should be plenty of this sort of co-operation, and we extend to every telephone man a most cordial invitation to join in it as quickly and as often as he sees an opportunity.

HOME-MADE MONEY SAVERS.

EVERY telephone exchange suffers more or less from the use of material not perfectly fitted to its requirements. The question before every manager who purchases material is how to get the best thing for the least money. He may have a good standard to go by, but unless he checks his purchases by this standard it is worse than useless to him. The main question is not open to discussion, for everyone realizes that such a course, if intelligently and properly carried out, leads to economy. When ways and means are considered is the time that difficulties appear.

On another page of this issue is published an article describing a device built by a manager for making a certain class of tests. It seems to be valuable not merely because it gives the designer a means of comparing values, but because it gives an economical means of doing this. It required thought to design it and work to build it, but once made ready it is capable of making itself useful for a long time. The man who built it would probably say that it cost him some money, but represents about the most profitable investment to be found in his exchange. His device is essentially a labor saver, and is only one example taken from a very numerous class of such devices. The inventive exchange manager, or wire chief, can, if he will give to such matters the necessary consideration, carry out a great many lines of special work in a manner which will cause it to much more than pay for itself.

ONE VALUE OF HIGH GRADE SERVICE.

THAT a telephone company must, in the final reckoning, stand or fall by the service it gives, is receiving some very strong demonstrations in certain sections of the South just now. The organization which at the present time finds itself in difficulties so numerous, and of such a varied nature, is directed by men who are prominent in the affairs which bring them in close touch with the leading men in their territory; the company has long had the reputation of keeping in close touch with proposed legislation; in protestations of good intentions it has not been backward. Under these circumstances it must be at a considerable loss to understand why the public in general and the various official bodies appointed to look out for the public interest, including the legislatures and city governing bodies, do not now wholly conform to its wishes. Although it has strenuously opposed, by all the methods available, the entrance of competing companies into its territory, its efforts are now almost wholly useless as a means of influencing those whom it has, from one point of view, done so much to propitiate.

As this company's policy has undoubtedly been carefully laid out in advance, and skilfully pushed, its defeat must be due to some inherent fault in the fundamental plan. This fault appears to be principally that the company has failed to realize that it is conducting a business, in which it creates a product to be sold at a profit. With the arrival of competing companies the people are given an opportunity to learn that the old concern was not too particular about the quality of its goods, and was very negligent in making deliveries. The consequence is that when they can buy elsewhere they are likely to do so, and furthermore that they will do everything possible to enlarge their opportunities in this direction.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

INJURY BY LIGHTNING AT SWITCHBOARD.

A telephone company is being sued for damages by an operator who claims to have been injured by lightning while at work at a switchboard. We would like very much to know if any decisions along this line have been made. Any information with which you may favor us will be greatly appreciated. G. A. B.

WE do not know of any reported case involving an injury to an operator working at a switchboard, but there are a number of cases involving injury from lightning under other circumstances, and these cases we give below. The company is not bound to exercise so high a degree of care to protect its employees as it is to protect third persons. As to third persons, it must exercise the highest degree of care under the circumstances, while as to persons in its employ it need only be ordinarily careful. Richmond & P. Electric R. Co., vs. Reuben (Va.), 47 S. E., 834. It would be a question in this case whether the company had taken all the necessary precautions to protect operators from lightning, such as the installing of proper lightning arresters. It would also be a question in the case whether the operator had not assumed the risk of working at a switchboard under the existing conditions which she probably had every opportunity of knowing. The cases referred to follow: Lightning Pole Co. vs. Bennett, 62 L. R. A., 219; Owen vs. Portage Telephone Company, 105 N. W., 924; Martin's Administrator vs. Cumberland Telephone Co., 76 N. W., 394; Griffith vs. Northeastern Telephone & Telegraph Co., 52 L. R. A., 919; Jackson vs. Wisconsin Telephone Co., 83 Wis., 243, 26 L. R. A., 101; Southwestern Telephone & Telegraph Co. vs. Robinson, 2 U. S. App., 205, 16 L. R. A., 545; Wells vs. N. E. Telephone Co., 64 A., 648.

COURT HAS NO RIGHT TO GRANT FRANCHISE OVER HIGHWAYS IN ANOTHER COUNTY.

THE court of Appeals at Nashville, Tenn., has denied the petition of the Long Distance Telephone Company for a franchise over the Franklin Turnpike from Nashville to Franklin on the ground that the Chancery Court of one county has no right to grant a franchise over public highways in another county. The turnpike is the property of the Franklin Turnpike Company, a chartered corporation, and its road extends from one county into another. The Chancery Court at Nashville had condemned all right of way asked by the telephone company, and the Court of Appeals upheld the lower court granting a franchise in its own county, but reversed its decree in so far as it allowed the telephone company to condemn property in another county.

CONFLICTING RIGHTS OF TELEPHONE AND RAILROAD COMPANIES SETTLED IN ARKANSAS.

THE Batesville and Winerva Company was engaged in the telephone business in certain counties in Arkansas running along the east bank of the White River and upon its own right of way. This line was lawfully constructed, right of way over private land having been obtained by verbal consent of the owners, and along the highway under authority granted by section 2934, Kirby's Digest. This expressly authorizes telephone companies to enter a railroad right of way and survey and lay out their lines. Afterward the St. Louis, Iron Mountain, and Southern Railroad Company constructed its railroad along the way occupied by the telephone company, the railroad having acquired its right of way by purchase from the land owners, and vacancy of county roads. The railroad company made repeated demands upon the telephone company to remove its line from its right of way, and its demands not being complied with, it cut down and removed about thirteen miles of the telephone line. The telephone company sued the railroad company for damages and recovered, the judgment being sustained by the Supreme Court of the State, on the ground that the telephone company was not a nuisance, and that the railroad company might have prevented the building of the telephone line by injunction if it was injured.

The telephone company recovered double damages on the ground that the injury to its line was done willfully and intentionally. The court held that it was entitled to single damages only as the words "willfully" and "intentionally" implied an evil intent without a justifiable excuse, and the railroad company had an excuse in that it believed that it was lawfully entitled to remove the line. St. Louis, I. M. & S. Ry. Co. vs. Batesville and Winerva Tel. Co., 97 S. W., 660.

ONE TAX COVERS ALL.

AT St. Paul, Minn., Judge Hallam filed a decision in the case of the State against the Twin City Telephone Company, holding that the payment by the company of its 3 per cent. gross earnings tax exempts it from any other form of taxation on real estate used in the business. The action was brought to recover taxes levied on the company's property for the year 1903. The court says the case is similar to that against the Northwestern Telephone Co. decided by the Supreme Court.

Section 1035 of the Code provides that "every telephone company shall pay into the State treasury on January 1 in each year 3 per cent. of its gross earnings derived from the business within the State, which shall be in lieu of all other taxes and assessments whatever upon such company and its capital stock.

Under this statute the Supreme Court has held that real estate owned by a telephone company and used in its business is exempt from ordinary taxation.

TRANSFER OF MASSACHUSETTS TELEPHONE STOCK.

AT Boston, Mass., attachments have been filed in the Suffolk Superior Court in actions on contracts aggregating $475,000 against George A. Fernald, banker, as trustee of certain property owned by Charles W. Morse of New York. The plaintiffs in the suits are Oakes Ames, a wealthy capitalist; Arthur S. Temple, who is associated with Mr. Ames in business, and Frank A. Cutting. Mr. Ames seeks $250,000 damages; Mr. Cutting asks for $75,000, and Mr. Temple wants $150,000. The attachments were filed against Mr. Fernald merely as a means of reaching property which was in his custody.

The suits are over the transfer of some stock in the Massachusetts Telephone and Telegraph Company, a concern organized a few years ago, and which is now said to be owned by the Bell people. According to one lawyer the plaintiffs transferred their stock to Mr. Morse, relying on certain promises, which agreements he has failed to keep. A lawyer talking about the case said: "These suits show some people that Ames, Cutting, and Temple are not the ones who sold out to the Bell people."

IN THE OPERATING FIELD

RELATIONS OF THE MUTUAL AND COMMERCIAL INDEPENDENT COMPANIES TO RECEIVE CONSIDERATION AT THE IOWA CONVENTION.

C. A. HOLLIS, manager of the Hudson Mutual Telephone Company, at Hudson, Iowa, has prepared a programme and list of questions for the session of the Iowa Independent Telephone Association on the afternoon of Wednesday, March 20, which is to be entirely given over to a consideration of the inter-dependence of mutual and commercial Independent companies of the State. Letters are being sent out over the signature of P. C. Holdoegel, president of the association, calling attention to the importance of this subject, and the desirability of having a complete discussion.

On the reverse side of each of these letters are printed some very interesting statements showing why it is to the advantage of all companies to send a representative. Attention is called to the fact that the representative will be able to acquire information during the convention which will enable him to save more than the expense of the trip through economies in the purchasing and using of telephones and other apparatus and material during the entire year. The manufacturers' exhibit is as important for every telephone company as the county fair or the State fair to the stock raiser. Not only do the representatives profit by this opportunity for direct observation of the goods which they are obliged to buy, and comparing the exhibits of the various manufacturers, but they may learn many practical points of operation from addresses by the most prominent telephone men in the State and the discussions which follow. More important than these features, however, is the necessity of each company appreciating the value of co-operation in the work of the State Association. Where the interests of one organization are so closely allied with those of its neighbors as are those of a telephone company, it is of the greatest importance that each company should be present when measures of common interest are being considered, and express its opinion by vote. In this way only can the interests of the entire State be learned and carried out.

No less than thirty-three questions relating to practical points of telephone construction and operation which will be discussed at the convention have already been prepared by Mr. Hollis, who is the State agent of the association, and this list is being mailed to all telephone companies in the State. If any telephone managers have not received this list they should write to him at once for a copy. Suggestions which will enable the committee to make the list more complete are also desired.

COLUMBUS INDEPENDENT EXCHANGE REAPS DECIDED ADVANTAGE FROM BELL FINANCIAL DIFFICULTIES.

THE reported inability of the Bell company to raise money through the attempted sale of the bonds of the parent concern is being felt in all portions of the country. One of the most important advantages gained from the lack of success in disposing of these bonds is reported from Columbus, O. The Press Post, in a recently published item, calls attention to the fact that the Central Union (Bell) company has been actively engaged in making preparations for a campaign to regain a portion of the ground lost to its competitor. A new building is being prepared, and for a long time the company has been engaged in the distribution of printed matter containing arguments intended to show up the favorable points of the Bell system. Now that the order for the curtailment of expenses has gone forth from headquarters, however, it is reported that the local company is unable to provide funds for the difficult fight which was foreseen in Columbus. Instead of making an active campaign for business, the company is said to be discharging employees. Not only is this policy said to be scheduled for Columbus, but also in many other places in the State of Ohio it is reported that new work planned by the company is to be abandoned, forces reduced and the strictest economy practised. While this policy is to be enforced by the Bell companies, owing to the orders from Boston headquarters, the Independent companies, relying upon local capital, are going ahead rapidly, meeting all the needs of the communities in which they operate.

IN HARD CASH.

What would it be worth a day to your home folks to be able to telephone and to answer calls from the second floor, and save running up and down stairs?

How much would it be worth to have noiseless means to call the police at night, within elbow reach of the bed?

How much would it be worth to have a telephone upstairs when fire breaks out on the first floor, to be able to call the fire department?

How much would it be worth to have a telephone within reach of the invalid lying in bed, so that a private talk can be had with the doctor at any hour without rising?

Do you think all these advantages, which the extension telephone arrangement gives, would be worth spending 3 cents a day for?

Surely these advantages are worth far more.

You can have an extension put in to-morrow that will cost you only 2 or 3 cents a day—and save you five or ten times that much worth of labor and worry and perhaps a great deal of money in an emergency.

Telephone the Contract Department [Main 294] and talk it over.

HOME TELEPHONE COMPANY.

An Interesting Example of Advertising Copy for Pushing Extension Set Business.

HONOLULU TO HAVE INDEPENDENT TELEPHONE SYSTEM.

ON April 26, 1905, a franchise for an Independent telephone system was granted to The Standard Telephone Company, Ltd., by the Legislature of Hawaii, and pursuant to the organic act was duly ratified by the United States Congress on June 20, 1906.

The franchise covers the entire Island of Oahu, the second in point of size in the Hawaiian group, which is 46 miles long by 26 miles broad with an area of 600 square miles, and having a population of 75,000 persons. Plans for the actual construction of the system have now been completed, marking the practical success of the organizers of the company in a fight carried on in the face of opposition as determined as that which is met in the States. The Standard Telephone Company was incorporated in February, 1901. Its president, Mr. Guy Owens, was for many years engaged in electrical construction work in Chicago, and went to the Islands in 1907, where he installed the entire electric lighting and telephone systems on five of the largest sugar plantations. In 1902 he became connected with the Standard company and in conjunction with an associate attempted to get the franchise bill through the Legislature of Hawaii in the spring of 1903. The plans were left largely in the hands of the associate, who claimed to be able to secure the necessary per-

Digitized by Google

mission, but as his abilities failed to materialize, the attempt failed. Mr. Owens, however, decided that he was in the Islands to conduct a telephone system, and, bearing in mind the old saying, "If you want a thing done well, do it yourself," went before the Legislature a second time. By careful planning and proper tact, the members were convinced of the desirability of giving the franchise, which passed by a large majority in April, 1905.

Work on building the plant is expected to start in about three months. A large force of skilled men in all the necessary branches will be secured from the States. The company will have its own building, absolutely fireproof, of re-inforced concrete and steel construction, which will be located in the business part of the city. Preparation is being made for an initial equipment for 2,000 telephones. These are expected to include about 1,000 residence instruments, 800 business lines, and 200 rural stations. The rates for these three classes of service are, respectively, $4.00, $6.50 and $2.50 per month. The rural rates apply to all stations on lines extending more than five miles from the center of the city.

The construction work will include eight miles of underground in the business section, sixty miles aerial, all cable, in the residence section, and 100 miles of pole line, with No. 12 copper wire in the rural districts. Over 400,000 feet of cable, 125,000 duct feet of conduit, 500 miles of No. 12 copper wire and 5,000 poles will be used.

The company is capitalized for $500.000 with the following officers and directors: Guy Owens, president; D. P. R. Isenberg, vice-president; Harry Armitage, treasurer; H. E. Murray, secretary; I. C. Carter, auditor. Mr. Owens now has full control of the stock which has been issued, making him the principal owner, as well as the managing head of the company. Many Independent telephone men will be interested to know that Mr. Roy Owens, superintendent of the automatic department of the Citizens' Telephone Company, Columbus, Ohio, is a brother of the president of the Standard company. Conditions in the Islands are said to be favorable to the development of a very satisfactory business for the new company. Honolulu is only six days' travel from San Francisco, and the climate is like the month of June the year round. The agricultural exports, mostly sugar, amount to over $40,000,000 annually.

TENNESSEE SUPREME COURT TO HURRY CONSIDERATION OF NASHVILLE TELEPHONE CASE.

THE Supreme Court of Tennessee has reconsidered its former action relative to the case of the Home Telephone Company and will hear the case at this term. The Court of Appeals of that State two weeks ago handed down a decision in favor of the Independent company against the city of Nashville, the features of which have been published in THE AMERICAN TELEPHONE JOURNAL. It was believed that the Supreme Court could not take up the case until the December term, but a later decision is to the effect that it will be heard this week. The Home Telephone Company, however, does not fear the result of this case, as the State legislature has passed a bill which has been signed by the governor, denying cities and counties the right to refuse the use of streets and public roads to public utilities of a general character, under which law the city of Nashville cannot interfere with the plans of the Home Company.

AMBULANCE? NOT FOR THIS LINEMAN.

McGREAL'S ambulance, the horse steaming and blowing from a hard run, pulled up at the corner of Broadway and Harvard avenue in Cleveland the other day, where it had been reported a telephone lineman was lying broken and dying from a fall from a lofty pole, but the driver found no sign of the victim or the customary crowd, says the *Plain Dealer*.

"Stung," commented the driver. Then he spied a lineman seated high up among the cross-arms of a tall pole. It was Colin Connors, a Cleveland Telephone Company employee. "Say, what were you guys doing, stringin' me?" the driver demanded of him.

"Why, no, son," Connors drawled. "You don't think that we would do such a thing to you." Then he proceeded to calmly tell the ambulance man that he had taken a little tumble from the very pole upon which he was working. "I forgot myself, and caught hold of a live wire, that was all," he said. "How far did I fall? Only thirty feet or so."

And no end of argument on the part of the ambulance men could tempt him in. The ambulance went back empty.

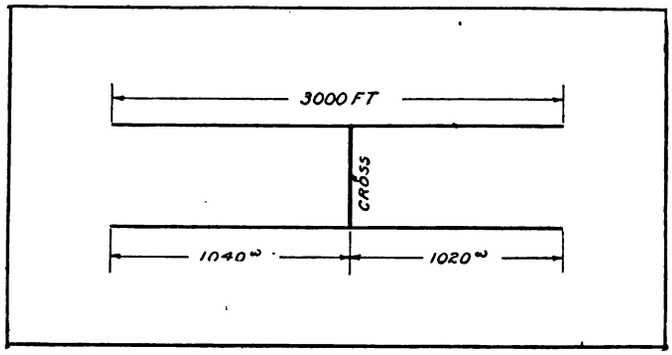
A METHOD OF LOCATING A WET SPOT IN A CABLE.

By W. B. BURKE.

TELEPHONE men who have trouble from a wet spot in a cable frequently have a great deal of difficulty in locating it. The writer has used the following method with good success in a number of cases. Measurements are taken from both ends of a pair of wires, and the distance to fault worked out by the formulas:

$$Y = \frac{C + D - B}{2},$$ which gives the resistance of the fault

from the figures obtained by taking measurements at both ends of the cable. The resistance from each end to the fault is then readily obtained by subtracting the resistance of the fault from



Conditions Existing in Cable Having Wet Spot, Location of Which is Obtained in Example Printed Below.

the loop resistance obtained in the measurement. With the resistance known, the length can be easily computed. The following table gives the letters used in computation, and following them the known figures from which a practical example was worked out:

A = total length of cable—3,000 feet.
B = total resistance of both wires—60 ohms.
C = reading in ohms at one end—1,040 ohms.
D = reading in ohms at the other end—1,020 ohms.
Y = resistance of the fault.
X = distance from one end.
X2 = distance from the other end.

From these figures it is clear that the resistance of the fault will be:

$$Y = \frac{1040 + 1020 - 60}{2} = 1000.$$

The resistance from each of the ends to the fault will be, respectively:

$$1040 - 1000 = 40$$
$$1020 - 1000 = 20.$$

From these figures may be obtained the distances, as follows:

$$X = \frac{3000 \times 20}{20 + 40} = \frac{60000}{60} = 1000 \text{ feet, distance from one end.}$$

$$X_2 = \frac{3000 \times 40}{40 + 20} = \frac{120000}{60} = 2000 \text{ feet from the other end.}$$

In this case the resistance of the wires in the cable was 10 ohms per 1,000 feet. Care should be taken not to take too long in obtaining the resistances from the ends of the cable, as the passage of the current, in case of a wet spot, is extremely likely to cause a variation in the resistance of the fault.

QUERIES

TRANSMITTER TROUBLE (827).

Please tell me why a local battery transmitter and a local battery induction coil with the regulation impedance coils for 10-volt work will not talk on a 10-volt storage battery circuit. Cut out the impedance coils and the transmitter talks all right, but it is necessary to have the coils in circuit. PENNA.

Your question is rather indefinite, so much so that we cannot say what might be done. If you will give more definite data, such as the ampereage of your storage battery, the resistance of your impedance coils, the resistance of your induction coil, the common battery system, to which you refer, and why you desire to operate a local battery instrument on a storage battery equipment, we will be pleased to advise you further.

The probability is that your impedance coils are of a sufficiently high resistance to cut down your current supply to such a point as will interfere with the transmission. Your transmitter would not last a very long time with the entire current supply of the storage battery passing through it. That is the reason some impedance is necessary.

Kindly let us hear further from you in relation to this question.

CONNECTIONS FOR LIGHTNING ARRESTER (828).

Will you kindly explain how to connect up the No. 400 lightning arrester, sold by Julius Andrae & Sons Co.? We are having a dispute as to the method of using it on grounded lines. B. R. G.

The following information comes from the company you mention:

In connecting up the No. 400 lightning arrester, the center, or long carbon block, should always be connected to ground for the purpose of affording to the lightning a ready path which will carry it to ground, instead of to the telephone instrument. On full metallic lines (Fig. 828*b*), one line should be connected to one outer carbon block and the other to the other outer carbon block. These two blocks should then be connected at their opposite ends to the outer binding posts of the telephone. This makes a complete connection through the two outside carbon

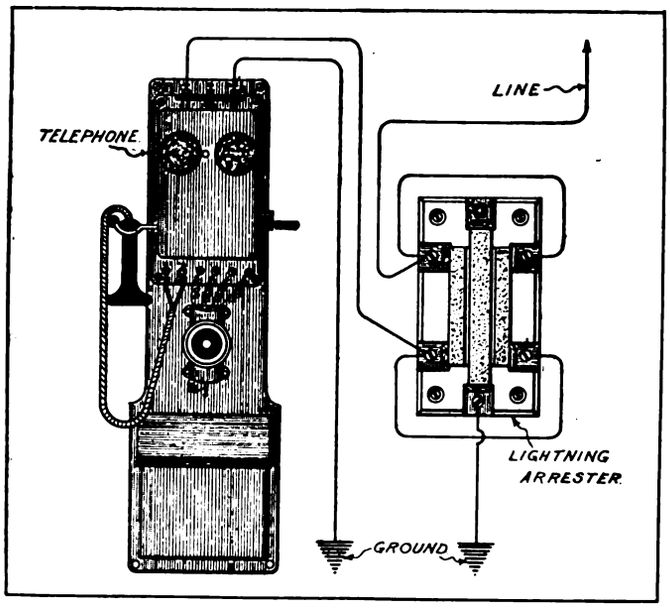

Fig. 828a.

blocks from line to telephone on each side, while the high tension current created by lightning will jump the air gap between the outside blocks and the center, thus taking a short path to ground instead of burning out the telephone.

On grounded lines the line wire should be connected to both of the outside carbon blocks at one end. These blocks should both be connected at the other end with one side of the telephone. The center carbon block and the other side of the telephone should be connected to ground. This arrangement is shown in Fig. 828a.

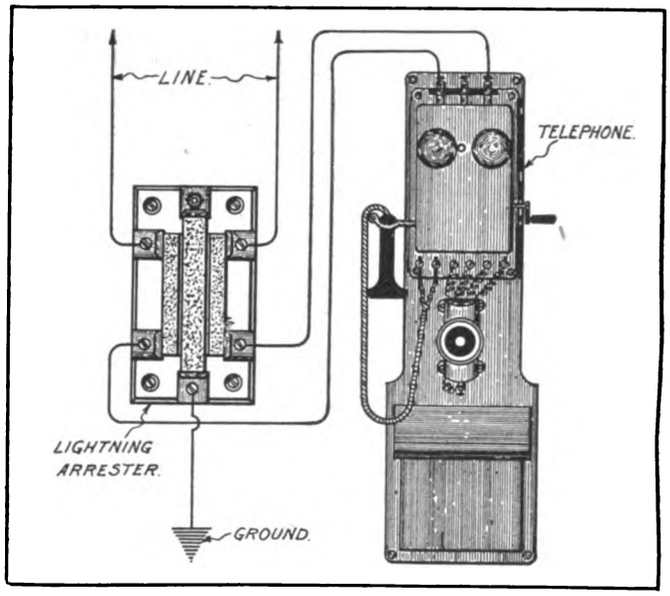

Fig. 828b.

The whole purpose of the No. 400, or any other lightning arrester, is to offer to lightning an easy path to ground. If the line were connected direct to ground it would offer such a path, but would also ground the telephone, which of course would render it inoperative. The next best thing, therefore, is to ground something that does not quite come in contact with the circuit of the line and then place this grounded electrode in as close proximity as possible to the electrodes connected to the line without touching them. It is always advisable to offer as large a surface as practicable, consequently the large blocks in the No. 400 lightning arrester which are used to make the instrument efficient in this respect.

COMPOSITION OF WIPING SOLDER (829).

What proportion of tin and lead do the manufacturing companies put in wiping solder? H. F.

The proportions of tin and lead in solder vary with the different manufacturers. However, the more common proportion is 60 per cent of lead to 40 per cent tin. None of the manufacturers will positively state the proportions they use. They will very freely send you a sample of the solder, but they refuse to divulge their formulas, else all might make equally as good. The only solder the proportions of which the writer can positively stand on, is "half and half," and even in this case we are simply accepting the manufacturer's word for it.

COMPARISON OF OAK AND LOCUST INSULATOR PINS.—(830)

Since the publication in our issue of February 2 of the report of tests made by the U. S. Forest Service on oak, locust and elm insulator pins there has been much discussion of their comparative merits. The Editor would like to hear from practical men who are willing to give their experience with pins made of any of these woods, and especially from those who are able to make comparisons.

TELEPHONE PATENTS

ANNUNCIATOR.

Harry J. Kusel, Chicago, Ill., patents (No. 842,565; dated January 29, 1907; filed November 20, 1905; serial No. 288,119) and assigns to the Williams-Abbott Electric Company, Cleveland, O., an annunciator drop.

This patent covers a switchboard drop with a removable field. The winding is slipped upon the core and fastened by a spring catch working in a slot cut into the core. In order that the coil may be separated from the core whenever desired, the armature is made in two pieces, one of which is rigidly locked to the armature lever, while the other may be unlatched and turned upward upon a pivot in the first to leave the end of the magnet fully exposed.

INSULATING RING AND BRACKET.

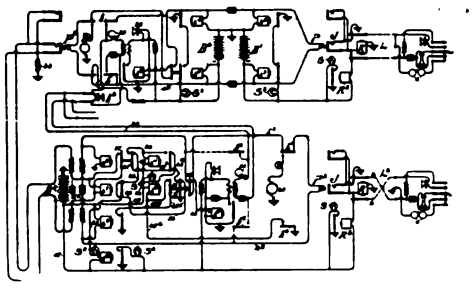
Frank B. Cook, Chicago, Ill., patents (No. 842,301; dated January 29, 1907; filed December 28, 1905; serial No. 293,662), an insulating ring and bracket.

This patent covers a combination insulating ring for "jumper" wires and bracket for securing terminal blocks on distributing frames. The entire device is formed up out of one piece of sheet metal suitably stamped into shape and perforated to permit of the making of necessary fastenings. After the ring has been formed it is covered with soft rubber, which is then heated and vulcanized, giving it a permanent insulating covering.

TRUNKING SYSTEM.

William W. Dean, Chicago, Ill., patents (No. 842,178, dated January 29, 1907; filed January 22, 1903; serial No. 140,166) and assigns to the Kellogg Switchboard and Supply Company, Chicago, Ill., a telephone trunking system.

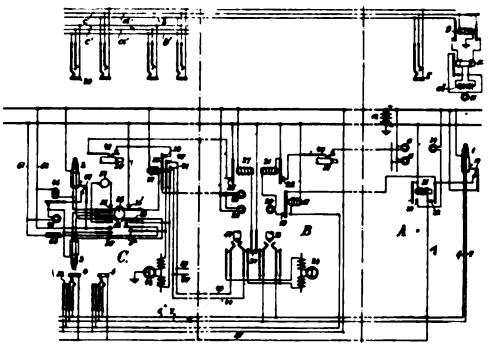
In the trunk circuit there is provided an auxiliary relay r^{13}, which is in the first instance operated on the depressing of ringing key k^4 when current from battery B^3 flows through the relay, and then by conductor 40*a* to spring k^4 to ground. Battery from the A office flows over the trunk line and through high resistance trunk relay r^7. Although supervisory relay r^5 is operated through the grounded retardation coil 34, as soon as the A operator inserts plug P^2, supervisory relay r^4 is not



actuated, while high resistance relay r^7 is in the battery circuit, and consequently lamp S^3 remains lighted to indicate that the called subscriber has not yet responded. Ringing lamp S^4 is now lighted from battery B^1 through normal contact and spring of locking relay r^{11} and forward contact and spring 51 of relay r^{13} to ground. When the subscriber answers tip relay r^5 is operated by current flowing out over the sleeve strand of the line, and back through tip relay r^5 to ground. The operation of this relay short circuits high resistance trunk relay r^7, and allows supervisory relay r^4 at the A position to be actuated. Spring 57 of relay r^5 closes the circuit of locking relay r^{11}, causing it to operate and open the circuit of ringing lamp S^4, thus indicating to the B operator that the subscriber has responded. During conversation battery B^1 at the A office furnishes current to line L, while battery B^2 furnishes current to the line L^2. When the subscriber on L^2 hangs up tip relay r^8 is de-energized and the resistance of relay r^7, thus reintroduced, causes the supervisory signal S^3 to be illuminated. The withdrawal of plug P^2 de-energizes the trunk relay, causing the disconnect signal S^6 and pilot signal S^6 to be lighted, owing to the actuation of relay r^{12}.

TELEPHONE SYSTEM.

Johan Anton Aven, Stockholm, Sweden, patents (No. 837,894, dated December 4, 1906; filed August 22, 1905; serial No. 275,-



252) and assigns to Deutsche Telephonwerke R. Stock & Co., G.M., B.H., of Berlin, Germany, a telephone system.

This patent covers a method of distributing telephone calls which is an interesting example of a certain type of European telephone engineering.

Three separate switchboards are employed: one designated b. the letter A being called the "annunciator" board, where calls are received; the apparatus at B being for an "inquiry" board, where the operator obtains from the subscriber the number of the desired line, and at C, known as the "connecting board," the connection is completed. When the subscriber calls his line signal 11 is illuminated, and the A operator inserts plug 1 connected to apparatus at the B board. In selecting a plug she chooses one associated with a lamp such as 15, which is illuminated, showing that the B operator is free to receive a call When the plug 1 is removed from its seat the contact 17 is closed, actuating signal 20 at the B position and relay 21, which puts out the signal 15 at the A position, indicating that the B operator is busy. The B operator on receipt of the signal depresses listening key 13, and takes the details of the call. She immediately afterward depresses her order key 14, leading to the telephone set of the C operator, whose idle condition is indicated by the fact that lamp 25 is illuminated. On receipt of the order the C operator inserts plug 3 in jack 4, thus connecting it by means of wires 6 and 7 with plug 1 and jack 8 associated with line of the calling subscriber. She also tests the line of the desired subscriber, such as 29, witth plug 2, and if it is idle inserts the plug, completing the connection. The lamp 20 at the B position is extinguished by the operation of relay 18 through circuit closed at point 52 of jack 4, indicating that the C operator has completed the connection. The armature of re-

A Long Distance Message

Yes! *Mr. Customer,* we thank you for last year's business.

We believe the real reason we did a larger business last year than in any previous year is because we have always made every piece of apparatus as good as it could be made with the best engineering knowledge and mechanical methods we could employ.

The grateful continuance of your patronage clearly substantiates these facts, and we will do a greater business this coming year than last.

Now, *Mr. Exchange Manager,* if you are not using STROMBERG-CARLSON apparatus and are not satisfied with what you are using, ask one of our customers if what we say is not true.

WE ASK FOR AN OPPORTUNITY TO SERVE YOU.

PATENTS—Continued.

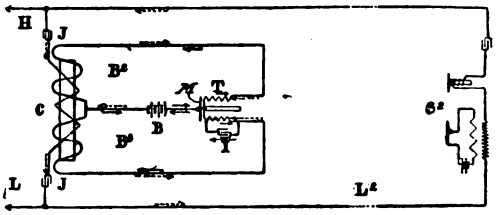
lay 21 returns to its back contact, illuminating signals 15, 16, showing the readiness of the B operator to receive another call.

Plugs 50 and 51 are inserted as long as the operator is in place. When they are removed the lamps are extinguished, indicating that no calls should be switched to the corresponding position. A supervisory signal is given through the actuation of relays 46 and 31, controlling lamps 45 and 34 respectively, giving simultaneous signals for disconnection to A and C operators.

TELEPHONE RELAY.

Nathaniel G. Warth, Columbus, O., patents (No. 845,282; dated February 26th, 1907; filed April 23d, 1906; serial No. 313,192) a telephone relay.

The object of this invention is to provide a repeater system in



which the relay device is in a local circuit, for the purpose of maintaining a balanced condition regardless of the relative lengths of lines at each side of the repeater circuit. By the arrangement described it is proposed to make a repeater which shall be capable of being used on composited lines, and which will have a receiver irresponsive to the current set up by the transmitter of the device, thus doing away with howling on an unbalanced line.

Across the line is bridged the secondary of an induction coil *C*, in series with condensers *J* when necessary for composite work. This induction coil has a split primary, to which are connected the receiving and transmitting elements. Primary circuit B^2 B^3 contains the battery transmitter *M* and receiver *T* and condenser *I*. The receiving element has two windings, and the battery current flowing through them produces a neutral magnetic state. In order, however, that the receiver shall not be neutral to incoming alternating currents the coil on one side is shunted by condenser *I*. The action of the currents of the device is indicated by the directions of the arrows, the primary currents being represented by the solid, and the secondary currents by the broken arrows. In connection with the receiving element of the repeater a permanent magnet is employed for creating a magnetic field for sensitization.

RECEIVER.

Louis Steinberger, New York, N. Y., patents (No. 838,362; dated Dec. 11, 1906; filed Jan. 16, 1905; serial No. 241,251) a receiver.

The instrument described in this patent is of the bi-polar type. The shank of the receiver is constructed of electrose or some other insulating material, and expanded at its forward end to form the rear half of a spherical chamber for the magnet coils, etc. The outside of this expanded portion is cut to form a shoulder, the forward part of which is threaded to receive a fibre cap, and the rear portion of which is threaded to take corresponding threads of a metal case, which when screwed into position butts against the outside of the cap. This metal case is retained at the rear by an insulating cap, which is threaded to screw over the fibre coil, and provided with a rim or shoulder which extends for some distance along the outer surface of the metal.

SELF-HEATING SOLDERING COPPER.

Roy Williams Marvell, Baltimore, Md., patents (No. 834,313; dated October 30, 1906; filed March 17, 1906; serial No. 306,637) and assigns by direct and mesne assignments to the Bennett-Marvell Manufacturing Company, a corporation of Delaware, a self-heating soldering copper.

The inventor provides for this soldering copper a hollow metallic handle adapted to be filled with gasoline. This is connected with the soldering point by a hollow tube which contains a wick. Midway between the handle and the point is inserted a casting, in which is mounted a needle valve for the purpose of regulating the supply of fuel. Below this casting is a cup which may be filled with fuel, either from an external source, or through drip openings above the head. The heat from the burning fuel in this cup causes the vaporization of the fuel in the body of the tube. This is ignited at a cylinder provided with suitable openings directly back of and communicating with the hollow rear portion of the soldering point. The front portion of the soldering point is made solid, in order that the heat may be better retained.

FUSE MOUNT.

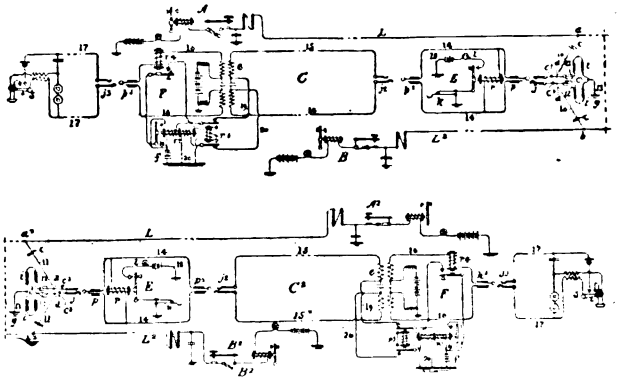
Charles E. White, Chicago, Ill., patents (No. 842,738; dated January 29, 1907; filed April 19, 1906; serial No. 312,687), and assigns to Frank B. Cook, Chicago, Ill., a fuse mount.

This patent covers a combination of terminals, with a spring member for retaining in position a tubular fuse. The ends of the fuse are inserted in openings in the terminal strips connected in the line circuit, and the action of the spring mounted adjacent to one of the terminals keeps the fuse in position and secures a good electrical contact.

COMPOSITE TELEPHONIC AND TELEGRAPHIC CIRCUIT.

George M. Yorke, New York, N. Y., patents (No. 845,157; dated February 26th, 1907; filed January 7th, 1907; serial No. 351,231) and assigns to the American Telephone & Telegraph Company, New York, N. Y., a composite telephonic and telegraphic circuit.

In the accompanying drawing a complete circuit is shown in a divided form for the sake of convenience. Line conductors *L* L^2 extend between pairs of terminal telegraph stations *A B* and A^2 B^2 at which they are grounded. These stations are equipped with the apparatus usual in composite systems. Conductors 10 and 11 bridge the telegraph lines, and extend to telephone stations *C* C^2. At each of these telephone stations equipment for a toll cord circuit, inter-office trunk and subscriber's line is shown in outline. The inductance coils *i*, condenser c^2 and



c at each station are designed in such dimensions and connected to the lines and ground *g* such a way as to prevent interference between telegraphic and telephonic currents. Under the terms of the present invention the two capacities *c* c^2 of two microfarads each, or jointly one microfarad, are connected between lines *L* and L^2, at *a* a^2 and *b* b^2, and earth at *g*. This increases the total capacity of both lines by only four microfarads, providing an arrangement which allows effective telephonic transmission without making the working of the telegraph lines sluggish.

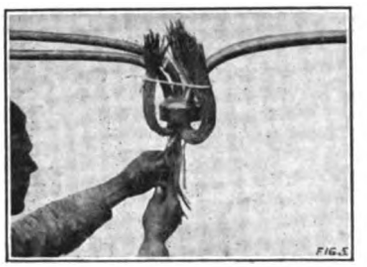
A MONEY SAVER S



A MONEY SAVER S

YOUR TIME

will earn money in direct proportion to your use of it. The use of the Hargis Cable Splicing Joint will enable you to save time. It will enable your regular linemen to make a better splice than an expert cable man. The picture above shows how easy it is to splice pairs by means of the Hargis Joint. They can all be tied out of the way while the splicing is going on.

The Hargis Joint is not a wiped joint in any sense of the word. The cables are simply put thru the cap and lead gasket and the lead is then poured in until the cup formed by the gasket and the brass cap is full. What wiping is done is simply to smooth off the rough edges, and does not add to the weather-resisting qualities of the joint.

HOW TO SAVE YOUR TIME

Let us send you descriptive matter of the Hargis Cable Splicing Joint shown above. By its use you can make a better splice in less than one half the time it takes to make a horizontal wiped joint, and at the same time you can always get into it by means of special tools to test out for trouble along the line.

It will pay you to write for our descriptive matter.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

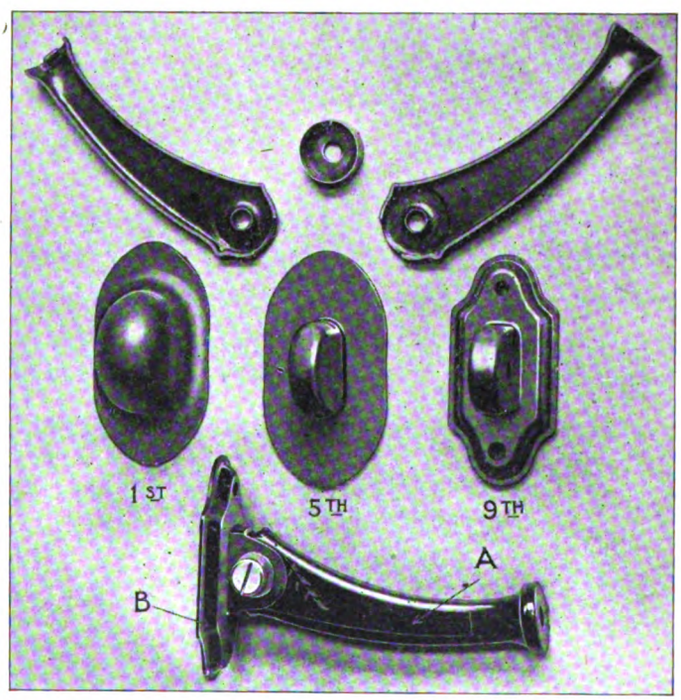
THE IMPROVED TRANSMITTER ARM MADE BY THE STROMBERG-CARLSON COMPANY.

A TRANSMITTER arm made of cold drawn steel of special temper for deep drawing, which presents some interesting features introduced as improvements over earlier types is now being made by the Stromberg-Carlson Telephone Manufacturing Co., Rochester, N. Y.

The base is made in nine operations, beginning first with a form like No. 1, which is drawn by degrees into shapes approaching that of the finished article. In the illustration are shown the forms at the end of the fifth operation and when completed. A base of this design is used in order to produce a rigid support that will not become loose when adjusting the transmitter arm to the desired position.

The arm consists of three punchings, a right and left side, and a formed cap on the transmitter end, which is spun over the two sides to hold them together. The opposite end is held by a steel ferrule riveted in place, which also acts as a fulcrum for the arm. This construction produces a light hollow arm that can not be bent or broken.

The transmitter arm is subjected to a great deal of abuse and being the most prominent appendage on a telephone, is often used for a handle before the instrument is placed on the wall. It therefore becomes almost a necessity that such parts shall be indestructible during transit and in actual service. Transmitter arms of this improved design are used with all series and bridging type wall telephones manufactured by the Stromberg-Carlson Company.



Parts of New Stromberg-Carlson Transmitter Arm.

MR. H. C. SLEMIN, formerly of the engineering and sales departments of the Stromberg-Carlson Telephone Manufacturing Company, Rochester, N. Y., has been appointed advertising manager in place of Mr. J. O. Oliver, who has joined the sales organization.

JULIUS ANDRAE & SONS CO., Milwaukee, Wis., announce that the well known "Giant Telephone" has been given two or three improvements recently, and its manufacturers are now furnishing it in either the Central Energy type, the Compact type or the Backboard type.

The "Giant" was among the very first telephones to be placed on the market, and its history is identified very closely with that of the early Independent telephone movement.

THE WESTON ELECTRICAL INSTRUMENT CO., Waverley Park, Newark, N. J., has issued under date of January, 1907, Bulletin No. 7, describing its electroplaters' voltmeter, model 131. This is a new instrument designed to meet the special requirements of an electroplating establishment. As is well known, in electroplating work the amount of current consumed in the bath is governed by the quantity of the work which is being done, and the current flow is of course dependent upon the voltage. Too much current causes the work to be burned, and too little current gives a thin deposit which comes off when buffed. It is therefore important to keep the voltage at exactly the proper value during the entire process. This voltmeter when properly used makes it possible to do away with the necessity of relying upon the guessing ability of the operator, thus improving the efficiency of the plants and securing uniformity on various classes of work.

Owing to the high cost of furnishing each tank with a proper voltmeter, platers have often hesitated to equip their plants for this method of regulation, but the Weston company has in its new instrument overcome the necessity for having a voltmeter at each tank. Associated with the voltmeter, which is mounted in an air-tight waterproof case to protect the internal mechanism from the action of acid fumes, is a small wooden switchboard carrying fifteen binding posts and a fourteen point switch. One of the binding posts, marked +, is to be attached to the positive side of the plating generator while each of the others is to be attached to the cathode side of a tank. The voltmeter is then connected to any desired tank simply by the manipulation of the switch.

The illustrated bulletin describing this instrument and full information concerning the methods of using it, costs, etc., may be obtained by writing to the company.

THE CALCULAGRAPH CO., 1437 Jewelers Bldg., New York City, has just issued a bulletin calling attention to the advantages of the calculagraph as an aid to the building up of a cost accounting system. Several interesting suggestions relating to its use in connection with a card system of recording labor point to the increased accuracy and flexibility of such a plan over some of the older methods. The company is prepared to send this bulletin and more detailed suggestions to interested persons.

FORT WAYNE ELECTRIC WORKS, Fort Wayne, Ind., has a booklet "Summer Comforts" for distribution. It illustrates and describes telephone booth fan motors. These are a delightful innovation appreciated by every user of a public booth pay station, and help get the nickels and dimes.

ELECTRIC GOODS MANUFACTURING CO., 115 Purchase street, Boston, Mass., is distributing a March calendar. "There is never much good in 'good enough,' Bill says," is the catch phrase, and it's a pretty good motto, and one the "House of the Four Circles" has the reputation of living up to. The calendar mentions electric fans for summer requirements. It is a subject telephone managers ought to be thinking of about this time.

Among the Chapters

Telephone Instruments, Telephone Lines, Telephone Exchange, Telephone Operation, Automatic Telephone, Wireless Telephony, Magnetism, Measurements, Wiring, Telegraphy, Direct Current Dynamos and Motors, Electric Lighting, Railway Power and Lighting, Arc Lamp Development, Electrical Construction, Management of Dynamos and Motors, Power Station, Alternating Current Machinery, Power Transmission.

FOR TELEPHONE MEN and ELECTRICIANS

This Cyclopedia contains more information on electricity and telephony than any other work published. It thoroughly explains all the duties of the manager, lineman, switch-board and troubleman. It not only fully explains the entire operation of a working telephone system, but it tells how to construct such a system. Treats fully on the Automatic Telephone and Wireless Telephony. Filled with information on electricity in all its forms---undoubtedly the best set of books for the telephone man who wishes to secure a fine position and a large salary.

Cyclopedia of Applied Electricity

Five large volumes---2,500 pages,---2,000 full page plates,---size of books 7 x 10 inches;---bound in three-quarters red morocco leather, fully indexed, Diagrams, Descriptions, Formulae, Sections, Tables---supplemented by practical test questions---prepared especially for practical men who have no knowledge of advanced mathematics.

Regular Price $30.00—Special 30 Days $19.80

Free for Inspection

Sent, express prepaid, for five days' FREE examination if you mention **American Telephone Journal.** Pay $2.00 down and $2.00 a month thereafter until you have paid $19.80, if you keep the books. We send for them, at our expense, if they do not meet your needs. The only reason this set is offered at such a low price is to acquaint the public with the superior instruction of the American School of Correspondence---these books being partly compiled from the instruction papers.

TO BE FOREWARNED IS TO BE FOREARMED

If you are not using a measuring instrument to test your lines, get one at once, as you will need it many times before the summer comes. It would be just as sensible for a grocer to try and sell sugar by guessing at its weight as it is for you to try to locate a fault in a line by the same method. PIGNOLET VOLT-AMMETERS are designed to give the best results required for testing purposes. They are not complicated nor do they require experts to operate them. Another point in their favor is their low cost. There is no instrument on the market which will give you as accurate results at anything near the price. Hadn't you better write for prices and further particulars By buying one now you will save its cost many times over before you have had it a year.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit

THE WEEK'S MESSAGES

NEW COMPANIES.

COLONA, COL.—A new Independent telephone company, to be known as the Uncompahgre Telephone Company, has been organized to build a line from Colona to Montrose. Among those interested in the enterprise are A. R. Walker and B. Brower.

FREEPORT, ILL.—Articles of incorporation have been filed by the Northwestern Telephone & Telegraph Company. It has an authorized capital stock of $30,000, and the incorporators are C. B. Cheadle, Frank Zinnel and B. A. Hendrick.

MASCOUTAH, ILL.—The Southern Illinois Long Distance Telephone Company, Mascoutah, Ill., has filed articles of incorporation. It has an authorized capital stock of $2,500, and the incorporators are G. F. Wembacher, H. V. Leitig and C. R. Harris.

PONTIAC, ILL.—The Independent Home Telephone Company has been incorporated with the following officers: President, F. G. White; vice-president, J. A. Marshall; treasurer, R. F. Bradford; secretary, S. E. Sims; attorney, H. G. Greenebaum; general manager, A. J. Vernier. About $25,000 has already been subscribed, and it is the organizers' intention to make the company a strictly home concern.

WOLF LAKE, ILL.—The Preston-Union Telephone Company has been organized, and it is its intention to construct and operate lines between Wolf Lake and Grand Tower. The following officers have been elected: Thomas Adams, president; E. G. Spring, vice-president; Henry Brown, treasurer; H. C. Wolfe, secretary.

MUSKOGEE, I. T.—Articles of incorporation have been filed by the Oklahoma State & Telephone Company, the capital stock being placed at $100,000, all of which has been subscribed. The incorporators are G. T. Berry, A. W. Shulthis, C. L. Thompson, G. Makon and others.

IOWA FALLS, IA.—The Iowa Falls, Ellis & Buckeye Mutual Telephone Company has been incorporated with a capital stock of $3,500.

IOWA, LA.—The farmers and citizens of Iowa, La., have organized a telephone company to be known as the Iowa Telephone Company, Ltd. J. F. Denizen has been elected president, and work on the system will be commenced at once.

DETROIT, MICH.—Incorporation papers for the Interstate Long Distance Telephone Company, with a capital stock of $15,000,000, have been filed at Lansing. The new company will have central offices in Detroit, and it has been organized for the purpose of building a long distance telephone system throughout Michigan, connecting with the various Independent systems of Michigan, Ohio and points east and west. Work will be commenced immediately on sixty telephone circuits, embracing more than 3,000 circuit miles of wire, and it is expected that $1,500,000 will be expended in construction work during the coming season. The directorate of the new company will also compose part of the directorate of the Home Telephone Company, which is constructing the Independent system in Detroit.

PURCELL, MO.—An Independent telephone company has been organized by the farmers residing in the north and west of Purcell, whose intention it is to build lines throughout that section, connecting with the Home exchange at Purcell. The line will be about twenty miles in length, and the following officers have been elected: Jos. Herger, president; H. McFerrin, treasurer; J. C. Ross, secretary.

FARMINGTON, MONT.—The Farmington Co-operative Telephone Company has been incorporated with a capital stock of $6,000, divided into four hundred shares. The directors for the first three months are H. R. Thompson, R. H. Wright and Ben Bollerud. It is the intention of the new company, which now has twenty-six telephones connected to a central station at Farmington, to construct lines to Choteau, Collins and Conrad.

MARTVILLE, N. Y.—Articles of incorporation have been filed by the Martville and Bethel Telephone Company. The capital stock is placed at $500, and the directors are Morris Palmer, Harry Eno and Irving Green, all of Martville.

OXFORD, N. C.—The Granville Telephone Company has been incorporated with a capital stock of $50,000. Among the incorporators are W. C. Currin, S. H. Jones, R. T. Critcher and others.

DELTA, O.—The Cass County Telephone Company has filed articles of incorporation. It has an authorized capital stock of $9,750, and the incorporators are W. W. Briggs, E. F. Briggs, D. B. Raker, F. S. Harmon and F. Briggs.

NEW RIEGEL, O.—An Independent telephone company, to be known as the New Riegel Mutual Telephone Company, has been organized, and the following officers elected: President, Lewis J. Huss; vice president, Charles M. Warner; secretary, B. R. Miller; treasurer, Stephen Pfeiffer.

PANDORA, O.—The Pandora Mutual Telephone Company, Pandora, has been organized by John T. Mallahan and others.

PATASKALA, O.—Articles of incorporation have been filed by the Pataskala Farmers' Telephone Company. It has a capital stock of $10,000 and the incorporators are F. B. Headley, J. O. Pryor, C. L. Ward, W. L. McCormick and D. D. Snider.

SHINROCK, O.—The Erie County Mutual Telephone Company has been incorporated with a capital stock of $10,000. F. J. Groves and others are among the incorporators.

TOLEDO, O.—The Capital Contracting Company, of Toledo, has been incorporated with a capital stock of $30,000 by Clement Carpenter, J. A. Barber, G. M. Hannon, Chas. E. Chittenden and R. W. Kirkley. It is the company's intention to construct telephone plants in some of the smaller towns in the middle west, and it is understood that Independent telephone men are largely interested in the enterprise.

WAYLAND, O.—The Paris Telephone Company, Wayland, has filed articles of incorporation. The capital stock is placed at $10,000, and the incorporators are J. M. Hurd and others.

CASHION, OKLA.—Articles of incorporation have been filed by the Interurban Telephone Company, which will start business with a capital stock of $500. The incorporators are H. N. Murray, of Cashion; Edward Owens and P. T. Beutler, of Lockridge. The company will operate lines between Cashion and Lockridge.

DELHI, OKLA.—The Delhi Telephone Company, with a capital stock of $4,977.50, has been incorporated by G. W. Johns, W. T. Blair, L. H. Roach and L. R. Gibson.

WOODWARD, OKLA.—An Independent telephone company, to be known as the Little Reservation Telephone Company, has been organized, and it is its intention to construct a line from Woodward north to the Cimarron River.

AZLE, TEXAS.—The Azle Telephone Company, of Azle and Fort Worth, has been incorporated with a capital stock of $2,000 by the following incorporators: Joseph Fowler, J. W. Walker, H. N. Grigsby, W. B. Kitchens and others. Lines are to be built to Austin and at Fort Worth connections will be made with the Fort Worth Telephone Company's wires for long distance service.

HEREFORD, TEX.—Articles of incorporation have been filed by the Hereford Telephone Company. Its capital stock is placed at $16,000, and the incorporators are C. J. Bain, R. H. Hemley, J. Carter and J. H. Beach.

WEAVER, TEXAS.—The Weaver Telephone Company has filed articles of incorporation. The capital stock is given as $12,000 and the incorporators are H. B. Davidson, A. W. Sparks, Jr., and J. S. King.

NARROWS, VA.—The Giles County Mutual Telephone Company has been incorporated with a capital stock of $5,000, and the following officers and directors elected: H. W. Hale, president; W. O. Coburn, treasurer; E. W. Hobbs, general manager; M. F. Brown, F. W. Gearheart, T. M. Guinn, J. H. Woolwine and J. E. Hopkins, directors.

CLEAR LAKE, WIS.—An Independent Telephone Company, has been formed by local capitalists at Clear Lake, whose intention it is to build lines in the village and surrounding country. The capital stock is placed at $5,000.

JOHNSON CREEK, WIS.—The Rock River Telephone Company, Johnson Creek, has been incorporated with a capital stock of $10,000. Among the incorporators are W. A. Christians, E. A. Seitz and E. L. Christians.

KEWAUNEE, WIS.—The Montpelier Telephone Company has been incorporated with a capital stock of $1,000, and the incorporators are John Zitler, William Goetsch, Albert Goetsch and others.

PRAIRIE DU SAC, WIS.—Articles of incorporation have been filed by the Farmers' Mutual Telephone Company. It has an authorized capital stock of $5,000, and the incorporators are Edwin Steidtmann, Henry Thoelke and Fred Waffenschmidt.

VEGREVILLE, ALB., CAN.—The Vegreville & Northern Telephone Company has been incorporated for the purpose of constructing an Independent telephone system in this town. Address F. W. Irwin, or S. A. Richardson, both of Vegreville, Alb.

FRANCHISES.

GRAFTON, N. D.—The city of Grafton has granted the North Dakota Independent Telephone Company both a local and long distance franchise. The company is now building a line from Minto to Grafton, and will later extend this line to the international boundary to meet one which is being constructed by the Canadian Government.

HURON, O.—A twenty-five year franchise for the Erie County Mutual Telephone Company has been applied for by Mr. Hine of Shinrock.

FINANCIAL.

PARIS, ILL.—The Mississippi Telephone Company, which has changed its location from Marshall to Paris, has increased its capital stock from $125,000 to $400,000.

DALEVILLE, IND.—A four per cent dividend has been declared by the Daleville Telephone Company on last year's business.

"JUST MY LUCK"

¶ "Out of work!" What does that mean to you? Have you ever been face to face with this possibility? Do you know what it means to meet the sign, "No Help Wanted" at every turn? Do you know what it means to crowd to the very doors of the newsboys' room of the big daily papers to get the first copy containing the day's "Help Wanted" advertisements — to race with ***hundreds*** of other applicants for a position which but ***one*** man can fill? Do you know what it means to be turned away with a sharp "You won't do"? Isn't it worth a little attention — not your time or money — to learn how you can avoid ever being placed in this position? Isn't it worth a two-cent stamp to gain ***independence?***

¶ It is not good luck that puts another man in the position that you would like to fill. It's not bad luck that keeps thousands out of work. It's simply lack of education — lack of special training to fill positions that require trained hands and brains.

¶ Thousands of positions are open today for men who have a good thorough knowledge of telephone work. Our course in Telephony thoroughly teaches everything, from the buying of the right-of-way to the operation of the completed system. If you want a position of trust and responsibility, with a large salary, we can qualify you at a cost of only a few cents a day. Write today.

WE EMPLOY NO AGENTS

to bother you with repeated calls at your home or place of business. We talk to you only by mail. The money you pay us is not used to maintain an expensive organization of high-priced agents, but is used to give you better instruction at a lower cost.

¶ Check the subject below that you are most interested in, and receive Free (if you mention this Paper) our 200-page hand-book telling you all about it.

THE WEEK'S MESSAGES

MONROE CITY, IND.—The capital stock of the Wabash Home Telephone Company has been increased from $25,000 to $40,000.

DUNNELL, MINN.—The Dunnell Telephone Company after the first six months of business has declared a 10 per cent. dividend and a five per cent. reserve fund. Extensive additions to its system are planned by the company.

TARBORO, N. C.—The Carolina Telephone and Telegraph Company, of which W. H. Powell is president, has increased its capital stock to $25,000.

BELLEVUE, O.—The capital stock of the Bellevue Home Telephone Company has been increased from $10,000 to $100,000.

COLUMBUS, O.—The regular quarterly dividend of 1 per cent. has been declared by the Columbus Citizens' Telephone Company.

GALLIPOLIS, O.—The Home Telephone Company, of Gallipolis, has increased its capital stock from $20,000 to $30,000.

NEW LEXINGTON, O.—The Citizens' Independent Telephone Company has increased its capital stock from $50,000 to $100,000.

MANSFIELD, TEXAS.—The Mansfield Telephone Company has increased its capital stock from $16,000 to $25,000.

BARRON, WIS.—The capital stock of the Barron County Telephone Company has been increased from $22,500 to $50,000.

KNAPP, WIS.—The capital stock of the Knapp Telephone Company has been increased from $5,000 to $10,000.

WALWORTH, WIS.—The stock of the Eureka Telephone Company, Walworth, has been increased from $5,000 to $15,000.

COMBINATIONS.

TROTTER, KY.—The Trotter Telephone Company, which now has connections with Hardinsburg, Palmyra, Lavonia, DePauw, Salem, Milltown and other places in Harrison and Washington counties, has effected a consolidation with the Rural Telephone Company at Fredericksburg.

TECUMSEH, NEB.—The Johnson County Home Telephone Company has acquired the Johnson County Telephone Company, the latter being the Smartville Company.

OSWAYO, PA.—The Oswayo Valley Telephone Company, which operates at Oswayo, Millport, Shinglehouse, East Sharon and other places, has been acquired by the Bolivar Telephone Company.

ELECTIONS.

REDLANDS, CAL.—The following officers and directors have been elected by the Southwestern Home Telephone Company: K. C. Wells, president; A. Gregory, vice-president; J. H. Breckinridge, secretary; Henry Fuller, C. H. Bigelow, J. F. Dostal and C. O. Barker, directors.

FORRESTON, ILL.—At the annual meeting of the Farmers' Mutual Telephone Company the following officers were elected: H. DeWall, president; C. Gastmund, vice-president; Henry Drake, treasurer.

DARMSTADT, IND.—At a meeting of the Daisy Telephone Company, Henry Sheakel was elected president, and Fred Schafer, secretary and treasurer.

GARRETT, IND.—The following directors have been elected by the Garrett Telephone Company: John Mager, W. W. Sharpless, John Brechbill, J. R. Lantz, H. W. Mountz, Emil Hill, L. D. Moore, Leo Mager, W. H. Coffinberry, F. B. McCullough and C. N. McCullay.

FARMERSBURG, IND.—The Farmersburg Mutual Telephone Company has elected the following directors: T. H. Kendall, Emery Jennings, A. Curry, A. J. Akers, T. Hook, C. O. Bowne and Harvey Lewis.

GILEAD, NEB.—The Gilead Home Telephone Company has elected the following officers: J. L. Magill, president; H. J. Deaver, vice president; J. W. Deaver, secretary; Frank Nelson, treasurer.

DALTON, N. Y.—The Livingston Rural Telephone Company has elected the following officers and directors: President, A. D. Baker; vice-president, W. H. Paine; secretary, W. D. Burt; treasurer, W. W. Hunt; directors, A. D. Baker, W. H. Paine and E. Nusbickel.

COLUMBUS, O.—The officers of the Columbus Citizens' Telephone Company are Henry A. Lanman, president; John Joyce, vice president; E. R. Sharp, secretary and treasurer.

CROOKSVILLE, O.—The Crooksville Independent Telephone Company has named J. B. Rhodes as president and general manager; T. F. Wilson, vice-president; William Harris, secretary; J. L. Bennett, treasurer.

HAVANA, O.—The Independent Telephone Company, recently organized at Havana, has elected the following officers: W. E. Clymer, president; E. Moos, vice president; G. G. Van Horn, treasurer; R. C. Niver, secretary and manager.

NEW CONCORD, O.—The following officers have been elected by the New Concord Telephone Company: President, S. C. Herdman; vice-president, J. E. McClelland; secretary and treasurer, J. B. Rhodes.

TOLEDO, O.—At the annual meeting of the Toledo Home Telephone Company the following directors were elected: James S. Brailey, Jr., M. V. Barbour, W. F. Robison, Clarence Brown, J. K. Secor, J. J. Manning, Eugene Zimmerman, H. C. Stifel, A. H. Bauer, T. H. Tracey, R. E. Hamblin, T. H. Walbridge, D. C. Shaw and E. J. Marshall.

WELLSBORO, PA.—The following officers and directors have been elected by the Farmers Mutual Telephone Company: President, Francis Kelley, of Charleston; secretary and treasurer, F. H. Niles, Charleston; directors, J. F. Haverley, T. J. Davies, W. H. Wilson, James Sampton and Albert Erway.

PERSONAL.

A. S. HILLHOUSE, formerly manager of the United States Telephone Company, of Cleveland, O., has been appointed assistant general manager of the Cuyahoga Telephone Company, of Cleveland. He will in this connection assume the duties of contract agent.

D. D. SHIPLEY, contract agent of the Cuyahoga Telephone Company, of Cleveland, has tendered his resignation to accept the position of state agent of the United Surety Company, of New York, with headquarters in Cleveland.

GEORGE B. ROBERTS, who has been engineer of the Independent Telephone Company at Topeka, Kansas, and had charge of the rebuilding of its plant, is engineer in charge of the building of the new plant for the Citizens' Telephone Company, St. Joseph, Mo.

MISCELLANEOUS.

WHEATLAND, CAL.—The Independent telephone line running from Wheatland to Marysville, formerly owned by F. W. Anderson, has become the property of the Bear River Dredging Company, whose intention it is to extend the system.

New Construction in the Field

REDLANDS, CAL.—It is the intention of the Southwestern Home Telephone Company to spend about $19,000 in extending its lines into new territory, toward the Imperial Valley. A new switchboard is also being installed at Redlands.

ATHENSVILLE, ILL.—A line from Athensville to Roodhouse is to be constructed by the Illinois Telephone Company.

CANTON, ILL.—A new line from Canton to Fairview is among the improvements planned by the Canton & Northwestern Telephone Company.

M'PHERSON, KAN.—New lines are being erected by the New Gottland Telephone Company.

SHARON, KY.—New lines are to be erected by the Barber County Telephone Company from Sharon to the county seat.

AUDUBON, MINN.—It is the intention of the Audubon Telephone Company to extend its lines to Maple Grove.

LIVINGSTON, MONT.—The Shields River Telephone Company is planning to construct branch lines from Clyde Park to Cottonwood and Horse Creek, and establish a toll line from Myersburg to Livingston. About forty new miles of line will be added to the company's system.

ELY, NEV.—Active construction work has been commenced both at Ely, Nev., and Salt Lake City by the Utah, Nevada & Idaho Telephone Company.

BLUE CREEK, O.—The Blue Creek Independent Telephone Company is constructing a new line to Rome.

AVA, N. Y.—Among the improvements planned for the East Ava Telephone Company is the stringing of about thirty-eight miles of additional wire.

NAVASTOTA, TEXAS.—Three new lines are to be strung by the Navastota Telephone Company between Roans Prairie and Bedias.

OZONA, TEX.—It is the intention of Garrett Bean and E. Miller to construct a modern telephone line between Ozona and Sheffield.

BERRYVILLE, VA.—Among the improvements under consideration by the Frederick & Clarke Telephone Company is the installation of a new exchange at Berryville.

MONROE, WASH.—The Independent Telephone Company is planning to extend its lines from Monroe via Cherry Valley to Novelty.

GRAFTON, W. VA.—The Consolidated Telephone Company expects to expend about eight thousand dollars in enlarging its equipment.

MAYSVILLE, W. VA.—The lines of the Mutual Telephone Company are to be extended from Maysville to Petersburg.

THORP, WIS.—The erection of a new line from Thorp to Roosevelt is contemplated by the Thorp Telephone Company.

UNDERGROUND.

DES MOINES, IOWA.—The Mutual Telephone Company is to place all its wires in conduits in the business portions of the city.

Quality Higher Than Price

¶ It's an easy matter to talk quality and price, but quite another to produce the goods to back it up.

¶ We have always put more faith and dollars into securing good materials and employing skillful and intelligent labor in the manufacture of our telephones than in advertising the fact, and the careful buyers are beginning to find it out.

¶ Prejudice and ignorance may hold the fort for a day, but merit and fair dealing in the end are invincible.

¶ We solicit your inquiries and an opportunity to quote prices and submit samples of our product.

CLAIMS FULFILLED

Viewed from the standpoint of scientific theory, no other storage battery plate can compare, detail for detail, with the Gould Integral Plate. Many of the largest Telephone Companies in the United States have purchased Gould Storage Batteries on the *very apparent* merit of our battery. It is a most significant fact that in almost every such case *repeat orders* have followed the first test order. The Gould Battery has succeeded because it has made good our claims for its unusual merit and economy.

Write for our catalogues.

JUST A SUGGESTION

Take one of your busy 4-party lines and equip it with "POOLE" Lock-Outs. Leave it in service a month and then see how many of the four will stand a raise of $3.00 a year rather than go back to the old way. We know the answer, but we want your subscribers to impress on you the fact that the "POOLE" Lock-Out is a rate-raiser.

It won't cost you anything to try it, because we will loan you the Lock-Outs free and there is no other equipment required. Write today for our Booklet AL-2.

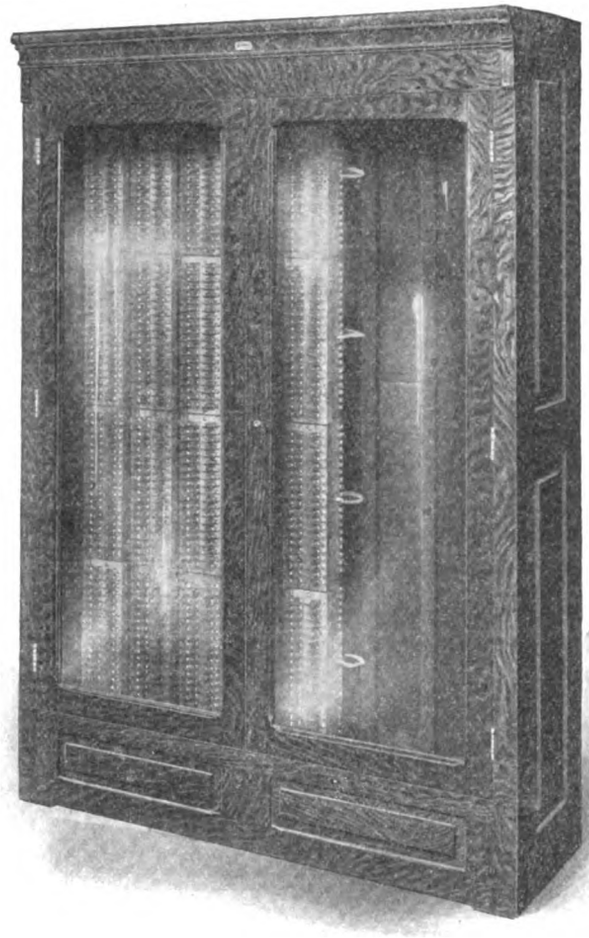
DEAN TELEPHONE APPARATUS

MAGNETO SWITCHBOARD PROTECTION



The accompanying illustration shows our magneto switchboard protection housed in a quarter-sawed oak cabinet.

This method of mounting is desirable when the terminals are to be located in the same room with the switchboard.

The cabinet has hinged glass panel doors in front and removable panels at the rear, so that both sets of arresters can be readily gotten at. Furthermore, the cabinet is made the same height and general design as our express type switchboard cabinet so that when hooked against the latter the whole has the appearance of a continuous cabinet.

We have told you about the arresters that come in this cabinet. It is a representative Dean product.

For price and further description for magneto express type switchboards and apparatus ask for our folder No. 6-A.

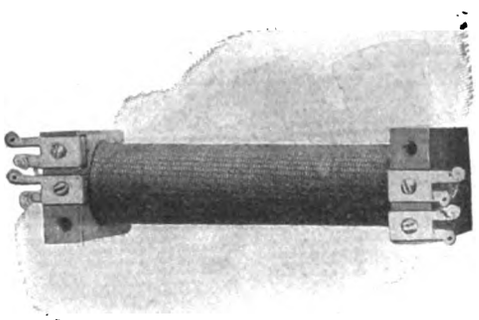
TELEPHONE APPARATUS

KELLOGG COMPACT DRY CELL TYPE TELEPHONES

CONTAIN THE KELLOGG INDUCTION COIL



The No. 1-A Induction Coil is 4¼ in. over-all and the size of the spool head is 1 in. square. It is absolutely the most efficient ever produced. Responsive to the great changes set up in the primary, and as a secondary, capable of receiving with a very low retardation effect. It is placed in the most accessible position, although there is really no need of removing the coil. Tests have proven that the Kellogg Induction Coil is the greatest aid to the efficiency of any talking circuit.

Let our Department A furnish you with our Bulletins and prices on Magneto Apparatus. We solicit your correspondence.

LOOKING FOR TROUBLE?

Suppose you have a line in trouble—grounded or open. You don't know the exact location, but you send out a troubleman to hunt it up and clear it. It may take him an hour or a day. Meanwhile the subscriber is getting hot under the collar and saying things about telephones in general and yours in particular.

If you have a Pignolet voltmeter or volt-ammeter you can determine the approximate location and also get an idea of the nature of the trouble. With the information your troubleman can find the fault in jig time, and you will have prevented the subscriber kicking by giving him service at the earliest possible moment.

Does it pay to be informed? You ought to know.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit

73 CORTLANDT ST., N. Y.

AS AN INVESTMENT

there's nothing more safe, more sure, more profitable—in the telephone business—than the securities of an Independent telephone company operating our AUTOMATIC TELEPHONE SYSTEM—

BECAUSE it gives more service, better service, prompter service, more accurate service than a manual system (and also an absolutely secret service, which no manual system can give) and

BECAUSE it costs less to operate, less to maintain, less to enlarge than a manual system, or

TO SUM IT ALL UP, the AUTOMATIC TELEPHONE SYSTEM produces a better telephone service, commanding a higher price, at less cost than inferior service can be produced for by a manual system.

THAT IS THE REASON WHY the AUTOMATIC TELEPHONE SYSTEM makes the securities of the company using it safe, stable and profitable, and why it has been adopted by the Independent telephone companies in the following cities:

Aberdeen, S. D.
Akron, Ohio.
Allentown, Pa.
Auburn, Me.
Auburn, N. Y.

Telephone Instruments, Telephone Lines, Telephone Exchange, Telephone Operation, Automatic Telephone. Wireless Telephony, Magnetism, Measurements, Wiring, Telegraphy, Direct Current Dynamos and Motors, Electric Lighting, Railway Power and Lighting, Arc Lamp Development, Electrical Construction, Management of Dynamos and Motors, Power Station, Alternating Current Machinery, Power Transmission.

FOR TELEPHONE MEN and ELECTRICIANS

This Cyclopedia contains more information on electricity and telephony than any other work published. It thoroughly explains all the duties of the manager, lineman, switch-board and troubleman. It not only fully explains the entire operation of a working telephone system, but it tells how to construct such a system. Treats fully on the Automatic Telephone and Wireless Telephony. Filled with information on electricity in all its forms---undoubtedly the best set of books for the telephone man who wishes to secure a fine position and a large salary.

Cyclopedia of Applied Electricity

Five large volumes---2,500 pages,---2,000 full page plates,---size of books 7 x 10 inches;---bound in red morocco, fully indexed, Diagrams, Descriptions, Formulae, Sections, Tables---supplemented by practical test questions---prepared especially for practical men who have no knowledge of advanced mathematics.

Regular Price $30.00—Special 30 Days $19.80

Free for Inspection

Sent, express prepaid, for five days' FREE examination if you mention **American Telephone Journal.** Pay $2.00 down and $2.00 a month thereafter until you have paid $19.80, if you keep the books. We send for them, at our expense, if they do not meet your needs. The only reason this set is offered at such a low price is to acquaint the public with the superior instruction of the American School of Correspondence---these books being partly compiled from the instruction papers.

AMERICAN SCHOOL OF CORRESPONDENCE

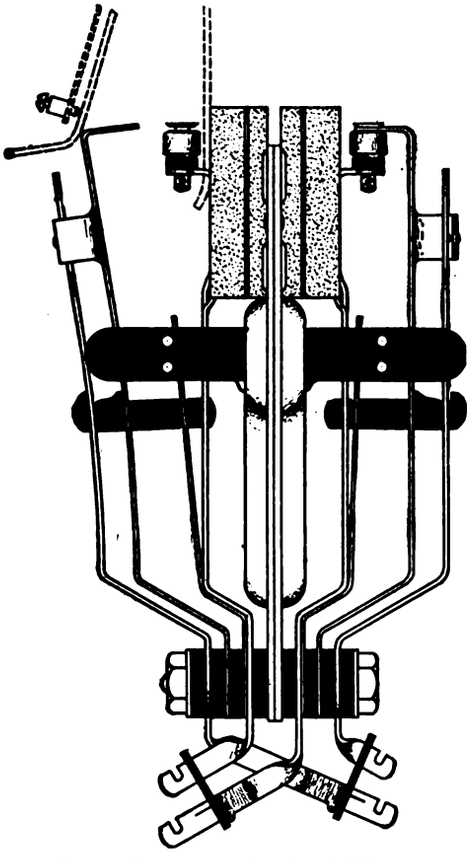
Amer. Tel. Jour., Mar. 16, '07



No. 10 Protector—Sectional View.

Cook's No. 10 Protector

THE automatic heat coil test, which is absolutely necessary in Cook's No. 10 Protector, before a spring which has been operated can be reset, is only ONE desirable feature of this protector.

The heat cartridge isn't a WIRE coil—it can't burn out or short circuit. It has a METAL SHELL which will not burn up and start fire in the coils above it.

It has so MANY other splendid points that we'd like to have you write for some more information before ordering or specifying switchboard protectors.

Frank B. Cook.

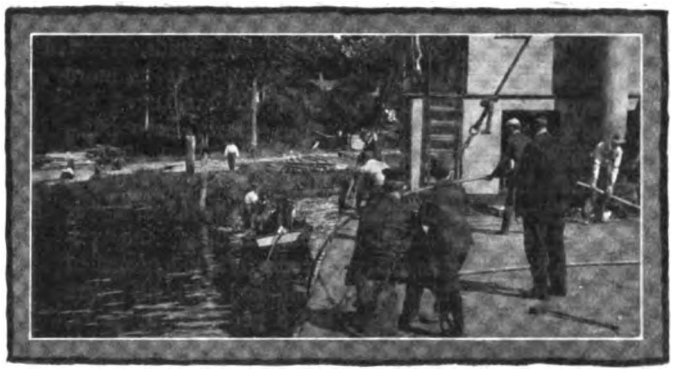
Laying the Hadlyme Submarine*

BY JOHN PUTNAM.

ILLUSTRATIONS FROM PHOTOGRAPHS BY THE AUTHOR.

WHEN this cable was laid a very simple arrangement of planks was used to control the motion of the reel. This provided an effective brake, to be sure, but one which was occasionally a bit inconvenient to handle. That it could be made to create a plentiful friction, as it bore against the rim of the heavily laden reel, was evident from the appearance of wisps of smoke which occasionally curled up from points where the two were in contact. This part of the work is shown in the left hand photograph at the foot of this page. It will be seen also from an examination of the next picture that some men were stationed at the point where the cable left the lighter to go into the water. Here the cable passed under a lever fastened at one end, upon which several men exerted pressure. In this way the cable was kept from unwinding more rapidly than the speed of the boat in crossing the river, so that there was no bight to be carried down stream to cause trouble before the opposite shore could be reached.



Carrying End of Cable to Shore in a Small Boat.

That this cable was no small affair may be seen from a comparison of the size of the big reel with the height of the men beside it. The cable, which was 18,000 feet long, weighed 10,000 lbs. It contains 25 pairs of No. 19 gauge B. & S. copper conductors, each insulated with two wrappings of paper wound in opposite directions. These conductors are twisted in pairs, with a lay not exceeding 3 inches, and are then laid up in a cylindrical core in reversed layers. This core is covered with two wrappings of paper. Outside of this core comes the lead sheath, which is 5-32 inch thick, which accounts for a very considerable portion of the weight of the cable which caused so much friction. The lead in the sheath is alloyed with tin to an amount not less than 3 per cent. Three separate layers of jute, wound in reverse directions, cover the lead sheath. Outside of this comes the armor of iron wire, No. 4 B. W. G., .238 inch in diameter. This armor is wound with a lay of between 20 and 24 inches; over it comes still another soft covering, this time of two wrappings of hemp, the two being laid on in reverse directions. This hemp is saturated with a preservative compound, composed of 65 parts of mineral pitch, 20 parts fine sand and 5 parts of tar, and to complete the job the cable is covered with whitewash or a similar material to prevent the coils from sticking together or to the reels. The armor wire is, of course, galvanized according to standard specifications.

As the lighter was warped toward midstream the cable was gradually unwound at the same speed as was made by the boat, so that it lay in approximately a straight line along the bottom, no wasteful slack being allowed to pass out. When the tug was reached the lighter was lashed to it, and the two then went forward to the east shore. When this shore was reached there was still some cable left on the reel, and this cable, of course, had to be taken off before it could be extended to the terminal on the bank. It was unwound by hand, with the reel still mounted on the shaft set up on the blocks. The cable may be seen in the right hand photograph at the foot of this page just as the last coil had been taken off, all of the loose length having been carefully laid out on the deck in the form of a figure eight, one loop of which is visible in the picture. The end of the cable was then taken ashore, and by means of a block and tackle all that was coiled on the deck of the boat was drawn over into the water and then to shore, where it was laid in a trench which had been dug from the edge of the water to the point of termination.

The Annual Convention of Michigan Telephone Men

By J. B. Ware.

THE tenth annual convention of the Michigan Independent Telephone Association was held at Coldwater, Mich., March 7-8, and was the most successful of the entire series of annual gatherings. Mayor G. E. Kleindinst made an excellent address of welcome, and Mr. E. B. Fisher, as president of the association, followed with an appropriate response and a fine annual address, reviewing conditions telephonically in Michigan and other states. The report of Treasurer Robinson, of Muskegon, showed a cash balance of $140 in the treasury. Every topic upon the programme was presented, except one—an unusual occurrence.

The list of addresses, according to the programme, was as follows: Thursday, March 7, 1907, 2:00 P. M. Address of Welcome, Hon. G. E. Kleindinst, Mayor of Coldwater; Response and address, Hon. E. B. Fisher, president Michigan Independent Telephone Association; Report of Treasurer, William Robinson, Muskegon; Report of Secretary, Hon. J. B. Ware, Grand Rapids; "Improving Toll Line Service," H. T. Clough, manager Owosso Exchange; State Traffic Association, W. S. Vivian, manager, Grand Rapids; "Telephone Patrons," Fred C. Hughes, manager Lansing Exchange; "Getting Business," C. H. Hood, contract department, Home Telephone Co., Detroit; "Manitoba Experiences," N. F. Wing, president Farmers' Telephone Company, Jackson; State Managers' Association, F. V. Newman, manager exchange at Grand Rapids; "Michigan's Thumb," H. A. Price, general manager Saginaw Valley Telephone Company, Bay City. Friday, March 8, 1907, 9:30 A. M.: "International Telephone Association," J. B. Hoge, president, Cleveland, O.; "Neighborly Greetings," Hon. F. L. Beam, president Ohio State Association (also from other visitors from Ohio and Indiana); "Our Duty to International Association," C. E. Tarte, general manager Citizens' Telephone Company, Grand Rapids; "Encroachments," J. E. Hisey, president Laingsburg Telephone Company; "Our Rural Friends," A. B. Fishback, manager Livingston Home Telephone Company, Howell; "Important Lessons in Rural Service," Thos. Bromley, Jr., general manager Lake Shore Telephone Company, Hart; "Chicago Connections," Theo. Thorward, president South Bend, Ind., Home Telephone Company; "Conditions in the Northwest," Hon. J. B. Ware, Grand Rapids.

E. B. Fisher, President of the Michigan Association.

While all the subjects discussed were treated in an admirable manner, the papers presented by Mr. H. T. Clough, Owosso, on "Toll Service"; by Mr. C. H. Wood, Detroit, on "Getting Business," and by Mr. A. B. Fishback, Howell, on "Our Rural Friends," were of especial merit and value.

Addresses by Mr. J. B. Hoge, Cleveland, O., president of International Association, and Mr. Frank L. Beam, Mt. Vernon, O., president of the Ohio Association, were of greatest interest and benefit. Mr. Hoge outlined the excellent conditions of operating companies throughout the country. Mr. Beam's address was an enthusiastic review of the Ohio conditions. He stated that Cleveland in 1896 had 6,500 telephones and now over 45,000; the latter figure being equal to the total number of telephones in Ohio in 1896. Last year the growth of the Ohio Independents was 22,000 telephones, and everything indicates that this year's increase will excel that of last year, in which case on the first of next January there will be more Independent telephones in Ohio than the Bell had in the entire United States in 1896.

Mr. Theodore Thorward, president of the Home Telephone Company, of South Bend, Ind., was present with an interesting paper explaining the present activity in building the long distance lines in Chicago, and the rapid development of the exchange in his city this year. The obtaining of the long distance connections with Chicago is of utmost importance to Southern Michigan, and the assurances given by Mr. Thorward make certain the development of Southwestern Michigan this year, including Kalamazoo, Dowagiac, Benton Harbor and St. Joseph. General Manager C. E. Tarte, of the Citizens' Telephone Company, Grand Rapids, announced that arrangements had been completed between the Citizens' Company and the one managed by Mr. Thorward for Chicago connections, and the toll lines between Grand Rapids and South Bend will be built this spring.

Thursday evening was given over to written and verbal reports from a large number of the companies in the state. Without exception all were favorable, showing that conditions of healthy growth and prosperity prevail. The Citizens' Company, of Grand Rapids, reported over 27,000 telephones in its system, owned by it in its more than 80 exchanges, besides nearly 4,000 miles of modern toll circuits. It has paid 38 quarterly cash dividends of 2 per cent, making the exceedingly good record of nine and one-half years of 8 per cent dividends. Its largest exchange is Grand Rapids, with over 8,500 telephones — the Bell having about 3,500. The population of the city is 100,000.

J. B. Ware, former secretary of the Michigan Independent Telephone Association.

The Saginaw Valley Telephone Company was reported by Auditor F. M. Howard, with about 4,000 telephones in the Saginaw Valley and 1,500 in the "Thumb." General Manager Price, in his excellent article upon "Michigan's Thumb," having in detail explained the development therein, showed that while the Bell had not a single exchange, the Valley Company, with the three small companies, has about 2,000 telephones in the 15 exchanges, and all are connected by good toll lines. Mr. Howard furnished information as to the amended franchise at Saginaw recently secured through the splendid efforts of Mr. C. O. Trask, which has a satisfactory "sliding scale" of rates, and was passed by unanimous vote of the council after months of campaigning upon the problem, and with the hearty approval of the citizens generally.

This assures a modernizing of the Saginaw exchange, and at once. Already $100,000 in cash for this work of extension has been secured.

Mr. W. B. Woodbury, general manager of the Home Telephone Company, Detroit, reported that his company put 1,200,000 feet of underground in last fall, and will begin work again as soon as the frost comes out of the ground. Poles for distribution have been placed, and a large quantity of cable has been drawn in during the winter. It is expected that the cable system for the main exchange will be completed by the time the main exchange is finished. The building is already up to the second story and will be finished in May. It is expected

Digitized by Google

to begin service about September 1, and to give commercial service in October, or at the latest in November next. The verified contracts already signed number 10,174, as reported by Mr. C. H. Wood in his article, to which reference has been made. Mr. Woodbury outlined the plan of developing other exchanges and the long distance business in Southeastern Michigan. The recent organization of the Inter-State Telephone and Telegraph Company, with $15,000,000 capital, was for the purpose of carrying out the plans named, and ample capital has already been secured.

Hon. W. O. Hunt, Adrian, reported 1,500 telephones, and 17 per cent dividends last year, also that the free service of the Bell company, so many years in force in Adrian, was discontinued last January, and with material results.

General Manager King, of Ann Arbor, reported the Home Company with 1,796 telephones in Ann Arbor, Ypsilanti and Dexter, which have all made a splendid gain during the past year. He described the very satisfactory installation and working of four police telephones in public places with 12-inch gongs, and stated that the council had unanimously voted to increase the number. He also reported having 70 University of Michigan professors as subscribers to the Home Telephone, the great majority having been secured during the past few months by reason of the popularity of the Home Company's excellent service. The outlook is most satisfactory.

The report of General Manager Melchers, of the Union Telephone Company, Alma, showed 7,000 telephones. The company has paid 8 per cent dividends for eight years. Satisfactory growth has been experienced, and excellent prospects for a continuance of these healthy conditions seem assured.

President A. C. Himebaugh (Burr Oak), of the Southern Michigan Telephone Company, reported having completed a large amount of long distance and exchange work in Southern Michigan during the past year, and has even larger arrangements planned for the present year. The recently finished exchange in Coldwater is as neat and trim as any plant in the United States. It is all cable construction—the first in the state. Mr. Himebaugh stated that during the five weeks the plant has been operated not one case of trouble has been reported. The very high standard of construction in the Coldwater exchange, the recent making of contract relations between Mr. Himebaugh's company and the Adrian Telephone Company for long distance development, and the building of an exchange in Hudson by Mr. Himebaugh, insures for Southern Michigan modern and adequate development for independent telephone interests, and this is sure to come with great rapidity. Mr. Himebaugh hopes to build Three Rivers, and possibly Kalamazoo, during the year.

Other very interesting reports were made as to growth and conditions of companies throughout the state. While complete statistics are not yet compiled, the indications are that Michigan has 100,000 Independent telephones now in service.

Mr. J. B. Ware reported that but 2.76 per cent of the stock of the Michigan State Telephone Company (Bell) was owned in the state, and this is held by 76 different persons.

There were about 150 members in attendance. The following were elected officers for the coming year: President, E. B. Fisher, secretary Citizens' Telephone Company, Grand Rapids; secretary, W. S. Vivian, Grand Rapids, manager of the State Traffic Association; treasurer, A. C. Himebaugh, Burr Oak, president Southern Michigan Telephone Company. Mr. Vivian's selection as secretary is most fortunate, as his constant and active relation to each of the operating companies in the state, through the Clearing House or Traffic Association, will enable him to obtain accurate data with great economy of time and effort.

Among resolutions adopted was one offered by Mr. C. E. Tarte, as follows: "That the Michigan Independent Telephone Association, appreciating the good work that has been and is being done by the International Independent Telephone Association, and being in thorough accord with its plans for the future, heartily endorse them, and pledge its liberal support, both financially and morally, to its future success."

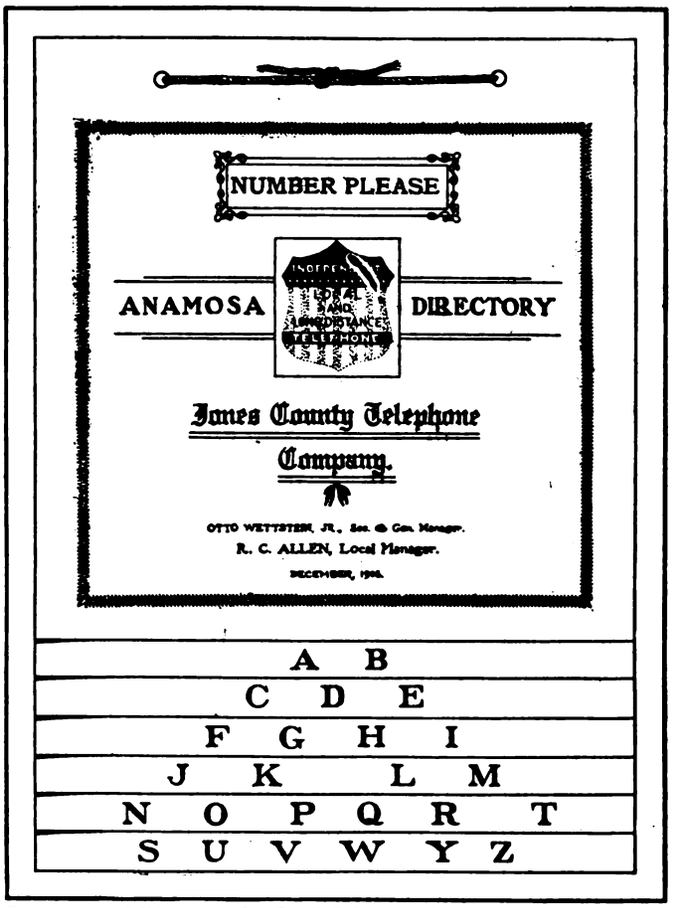
The executive committee will be announced by the president, as provided by the constitution. A legislative committee was appointed by the president as follows: W. B. Woodbury, Detroit, Home Telephone Co.; R. B. McPherson, Howell, Livingston Home Telephone Co.; R. D. Graham, Grand Rapids, Citizens' Telephone Co.; W. B. Melchers, Alma, Union Telephone Co.; Thos. Bromley, Jr., Hart, Lake Shore Telephone Co.

The following were elected to attend the International Independent Telephone Association as delegates and alternates-at-large for the state: Delegates, J. B. Ware, Grand Rapids; W. B. Woodbury, Detroit; A. C. Himebaugh, Burr Oak; W. J. Melchers, Alma; C. E. Tarte, Grand Rapids. Alternates: R. B. McPherson, Howell; R. C. Smith, Homer; C. R. King, Ann Arbor; W. A. Young, Benzonia; H. A. Price, Bay City.

A DIRECTORY IDEA FOR SMALL TELEPHONE COMPANIES.

THE accompanying illustration shows the appearance of the front of one of the directories of the Jones County Telephone Company, of Anamosa, Ia.

This company operates a large number of rural lines, and the list of its subscribers, closely printed, occupies six pages of



Front View of Directory of a Small Telephone Company, Printed on Cards, With Index at the Foot of Each Card.

the different lengths indicated by the horizontal lines at the foot of the diagram. The actual dimensions of the directory are 6¾ inches by 9⅜ inches. The first page, which serves as a cover, being square, is 6¾ x 6¾ inches in size, and the others increase in length by regular intervals.

The foot of each directory page is left blank, with the exception of the letters which serve as an index. The list of names is arranged in two columns, with a dividing line between, so that the index letters not only indicate the page, but also the column in which the names beginning with a given letter may be found. The dimensions of the directory are so chosen and the arrangement of lists so made that in no case is a group of names beginning with a single letter divided between two pages. Blank spaces in the columns are left, when necessary, in order

Digitized by Google

that this plan may be carried out. The leaves of the directory are made of fairly heavy Bristol board and bound together with a cord. In the centre of the front cover is the Shield in the regulation three colors. This idea seems to be a very good one for moderate sized rural line companies, giving a durable directory which can be arranged in convenient form at a comparatively low cost. It presents a number of alvantages over the use of a book for a list of moderate size.

A Photographic Process for Registering the Voice

By Dr. Alfred Gradenwitz.

MOST of the apparatus so far used for registering and reproducing the human voice (phonographs and graphophones) show the disadvantage that the quality of reproduction is impaired by disturbing secondary noises, while on the other hand records are subject to a more or less rapid wear and tear in the case of frequent use. Only the selenium phonograph or photographophone invented by E. Rühmer and the electro-magnetic phonograph or telegraphone are believed to be nearly free from these defects, but the low intensity of the records given by these apparatus is usually considered a drawback in their use.

A novel method for registering photographically the sounds of the human voice has been recently suggested by J. Palla, of Prague. If a porous moist layer of material such as paper, gelatine, etc., placed on a conductive plate and soaked with a solution of metallic salt, be submitted to the action of electric currents, supplied through a metal point touching the sensitive layer, alterations will be produced in the latter, the salt solution being decomposed and the metal being precipitated on the plate located underneath. The current carrying point may be moved over the surface of the moist layer in any path whatsoever, and if the layer in question be afterwards treated with a convenient reduction agent the line traced by the point on the plate will become transparent, while all the surrounding parts appear dark. In fact, the layer is permeated throughout its mass with a finely divided reductive metal, excepting those portions at which the metal, having been precipitated by the effect of the current, cannot be further reduced

If in the place of a constant current, varying current impulses be made to act on the layer, a transparent line of an intensity proportionate to the actual current intensity will be obtained instead of a continuous transparent line of uniform depth and dimensions.

In fact, an amount of metal corresponding to the current intensity will be precipitated and protected against the effects of a subsequent reduction by each current impulse traversing the plate. If the currents be produced by a transmitter, a stronger sound will correspond to a more intense transmitter current, and, as the latter will precipitate a more considerable quantity of metal, to a more transparent portion of the layer.

On testing the electrical conductivity of the layer the dark portions, owing to the metal contained in them, will be found to possess a far greater conductive power than the transparent portions, conductivity being varied in the same manner as the intensity of the microphone current. Thence it is inferred that by

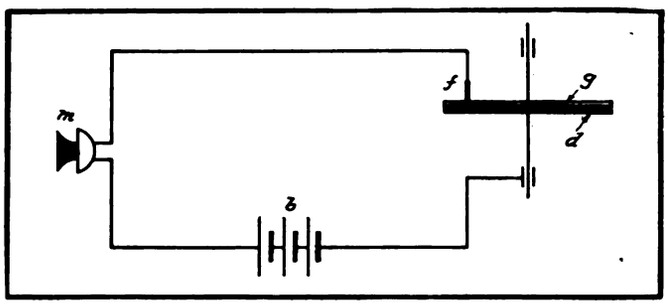


Fig. 1. Arrangement for recording the voice by a photographic process, using ordinary telephone transmitter.

inverting the experiment, that is to say, by using a layer previously acted upon and a telephone receiver in place of a transmitter, the telephone will receive current impulses quite similar to those previously generated by the transmitter. The telephone will thus give out the same sounds and notes which had exerted their action on the transmitter, and the same plate can thus be used in recording and reproducing the voice, but for the sound waves being displaced temporarily by one-half phase. The inventor, however, recommends preparing copies of the record plate according to a process quite similar to a photographic method. The record plate is used as positive and a layer of paper or gelatine, rich in silver, as negative, when any number of copies will be obtained which, at the places characterized by a greater intensity of sound and current during the registering process, will contain greater amounts of silver, thus opposing a smaller resistance to the telephone current. The recorded sounds thus become audible according to their proper value.

In Fig. 1 is represented the arrangement used in registering, and in Fig. 2 the arrangement for reproducing sounds. The former comprises in the circuit of a battery *b* a transmitter

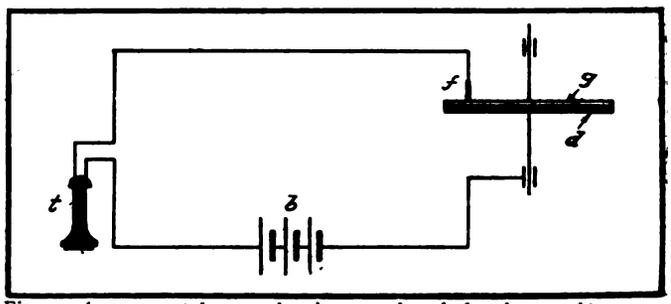

Fig. 2. Arrangement for transforming record made by photographic process into speech with the aid of a telephone receiver.

m and a rotating disc *d* covered with a porous layer *g* on which slides a metal point *f*, moving in a manner analogous to a graphophone point radially toward the axis of the disc and tracing on the latter as it turns a spiral line. The porous layer *g* is soaked with a silver salt sensitive to light.

On talking into the transmitter *m* each increase of current between the point *f* and metal disc *d* will correspond with the decomposition of a certain amount of silver salt and the precipitating of a proportional amount of silver on the plate *d*. A spiral line of varying silver percentage is thus formed on the layer *g*, the silver percentage being inversely proportional to the intensity of the current actually traversing the plate. If now the layer *g* be exposed to light, all the silver remaining in the latter will be reduced, and while at those places at which no current has been allowed to pass portions of maximum silver percentage will be produced, only the product of decomposition will remain at the point traversed by current, in proportion to the actual current intensity. The product of decomposition having been removed by fixing and washing, a photographic negative of the layer is prepared with a current-conducting layer. The spiral line formed in this negative will show a maximum percentage of silver at those places of the layer which contain minimum amounts of silver, thus offering a minimum resistance, so that in the negative the amount of current-conducting silver will be directly proportional to the actual intensity of the recording current, and thus to the intensity of the sounds. If now, the negative *h* having been placed on the plate *d*, a telephone *t* be substituted in the circuit for the transmitter previously used, the same current fluctuations as in the recording circuit will be generated in the line, the sounds perceived in the tele-

Digitized by Google

phone thus being identical to those recorded by the transmitter.

Another alternative consists in soaking the layer *g* with sodium cyanide and using an iron contact point. According to the actual current intensity in the recording circuit, a variable amount of Prussian blue will be formed in the layer. After fixing this layer, a photographic negative is prepared with yellow light, which negative again serves for preparing photographic positives showing maximum amounts of metal at those points which contained maximum amounts of Prussian blue in the recording layer, thus showing a minimum resistance and giving out sounds of maximum intensity.

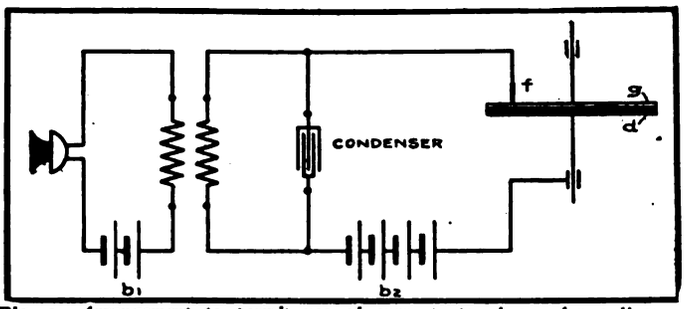

Fig. 3. Arrangement to permit use of currents too heavy for ordinary transmitter to give better voice records.

As ordinary transmitters will admit only of low current intensities, either a multiple transmitter with induction coils connected up in parallel, or an arrangement analogous to that of talking lamps should be used (Fig. 3). The latter arrangement will allow great current intensities to be used.

If the recording and reproducing stations be distant from each other (being connected by a wire) the above arrangement can obviously be used for telegraphic or telephonic purposes. The inventor also hopes to use his apparatus for wireless telegraphy and telephony.

Rural Party Line Ringing Codes

HAVING been "up against" the Multi-Party-Line Ringing Code propositions very much of the last two years and, in that time, tried everything I have been able to pick up, finally discarding all these codes or schemes and devising an original one which has so far proven successful, I can hardly resist the editorial invitation of February 16 to submit some of the schemes tried.

The first, and perhaps the simplest tried was Code A, shown in the accompanying Table 1.

This code provided for more than one exchange, or switching point, which is a comparatively rare condition on lines so heavily loaded as the code provides for, i. e., thirty telephones and four switching stations.

As may be readily noted, long rings were used for the exchanges, while for the parties short, or short and long calls were used in accordance with the following scheme: One to five represented by corresponding numbers of short rings; six to ten by one long (practically equal to five short) plus from one to five short rings; numbering above ten being made up of numbers as the preceding and using "space" (about one second) to indicate separations between figures; thus the code can be enlarged to provide for ninety-nine telephones if this were desired.

NOTE.—First set, Nos. 1, 2, 3 and 4, for exchange or switching station; other numbers for subscribers.

Table 1.

The principal difficulty met with in practice was with the "spaced" numbers, such as eleven, often rendered as two, or with twenty-two, often rendered as four, etc.; also, unless care was used, when a call, twelve for instance, was repeated several times the last part (two short) would be taken with the first part of the repeated call (one short) and understood as twenty-one, etc. This led to the adoption of Code B, shown in Table 2.

Table 2.

It will be noted that in both of these codes there is used for the first party one short ring, assuming that the answer will be by "voice."

In many instances the parties use that ring as an "answer," also as a "ring-off," in which case it is necessary to omit the first party call and start with the second, thus considering the exchange or switching point the first party on the line. Such a practice, common as it is, can hardly be considered logical as, particularly on heavily loaded lines, the disconnecting at the exchange is at least as important as the connecting, because, even with the remarkably strong generators of the present day, there is quite a difference between ringing the bells on one line and ringing those on two such lines together; in addition to this the best of generators will be comparatively short lived if used much on lines while practically short circuited, as are, from a

Digitized by Google

ringing standpoint, such lines while two or more are connected together.

When disconnections are not promptly attended to there is a probability of confusion from rings going through the exchange to parties on the connected line when a party on the caller's own line is desired; on this account we have found it a good plan to use the same ring for the exchange, whether a connection

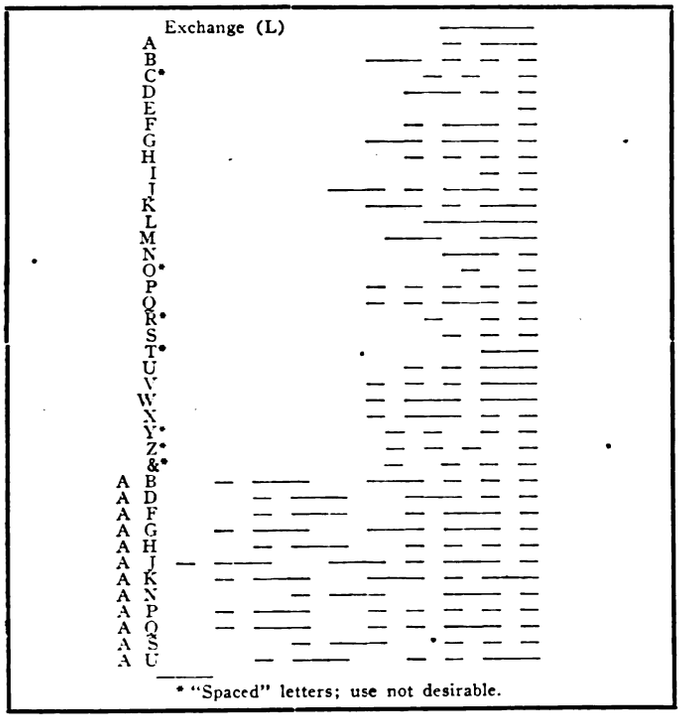

Table 3.

or a disconnection is desired; the element of doubt generally insuring better attention at the exchange or switching station, particularly where the attendant has other duties to attend to.

Code B worked first rate for some time, as it was simple like Code A and eliminated its most troublesome feature: "spaced" signals. When this code was used we had push buttons wired in series with the generators so that one could turn the crank continuously while making the signal with the button, this scheme being very useful as a time saver when any complicated or extensive code is used.

We would probably still be using this code had not the company, about the time we had gotten things going smoothly, shown its rank rurality by becoming a sub-licensee of the Boston Octopus, after which we had to take what equipment they saw fit to hand out rather than what we should have had, so we were furnished with "No. 237-a Wall Sets," these being equipped with large five bar generators (with a light weight—about three bar size gearing), the armatures of which were *cast* instead of laminated, as are practically all good high power generators at present.

These soon "fell down," due partially to the heavy loads on our lines and partially to the hard usage incidental to repeated futile efforts, on the part of our subscribers, to get the parties on the ends of the various long lines. The average individual, particularly if in a hurry, starts the crank with a jerk, then instead of allowing it to come to rest at the end of a revolution, stops it with a similar jerk when ringing a series of short rings. In ringing nine, ten or nineteen, for instance, this means eighteen or twenty jerks on the generator mechanism. It soon became evident that the generators would not stand this sort of thing and as the licensing company would furnish push buttons in the generator circuits under no circumstances whatever, and would not allow us to "mutilate" the instruments by installing the buttons ourselves, we had to change the code to suit the equipment.

Code B is very simple in principle; short rings to the number desired, form the calls from one to ten, while for the "teens" (including eleven and twelve), one long, followed by the proper number of short rings to indicate which "teen" is desired, is used; the twenties being formed similarly except that they are introduced by two long rings. This scheme is, like the preceding, capable of expansion, so as to include calls for any practicable number of telephones.

Where either Code A or B is used, it is generally feasible to letter the lines and number the calls, as the multi-party lines in any one exchange or switching station will very rarely exceed twenty-five in number.

In the next code we used we numbered the lines and lettered the calls, using the Morse alphabet as shown in Table 3.

As spaced letters had to be omitted, for reasons previously explained, we were limited to twenty calls, including the exchange, for which L (one long ring) was always used, and as we had lines with as many as forty-nine instruments on, we "doubled up" some calls in this wise: AB, AD, AF, AG, AH, AJ, AK, AL, AN, AP, AQ, AS, AU, AV, AW, AX, BA, BB, BD, BE, etc. This looks rather odd to a telephonist but the scheme is a fairly good one for use where the generator equipment is not good and all unnecessary wear is to be avoided. It will be found that subscribers will learn the rings associated with the letters, or vice versa, with fair rapidity, much better than one would at first suppose, so that there is little trouble experienced in applying the code. It is understood, of course, that the code is to be carefully explained in the subscriber's directory or list.

The greatest difficulty met with in its use was the confusion of letters due to their close similarity in sound, particularly when transmitted telephonically, as B and V, C and E, S and F, M and N, etc. This fault is inherent in all codes employing other than a few easily distinguishable letters, as many managers of large city exchange systems have learned to their chagrin after attempting to designate all of their branch offices by letters; the confusion in some cases being almost indescribable, and compelling the abandonment of the scheme.

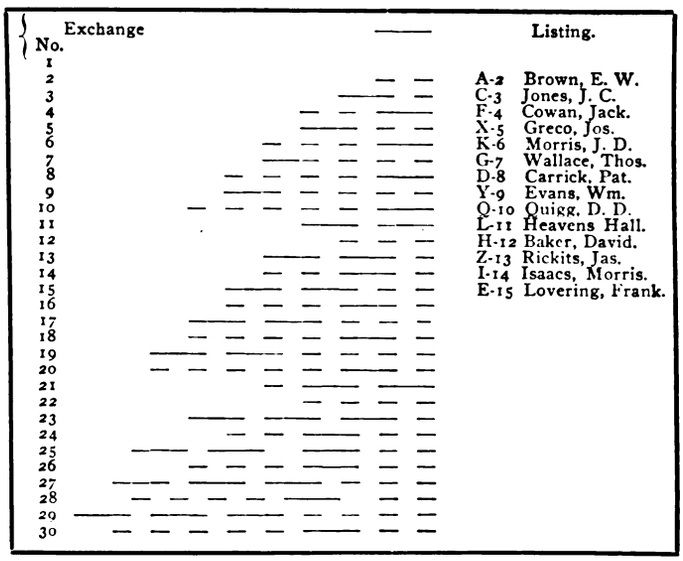

Table 4.

The next code proposed was Code D, shown in Table 4, which possesses some particular as well as peculiar advantages; note that all "odd" numbered calls are formed with an initial "dash" (or long ring) while all "even" numbered calls are initialed by two "dots," or short rings. This code is, like some of its predecessors, comparatively simple, also to a considerable extent systematized; fourteen is formed by adding one short ring to four, twenty-four is four plus two short rings, thirteen consists of three-prefixed by one long ring, twenty-three is three prefixed by two long rings, etc., thus this scheme can be enlarged upon to fulfill the requirements of a line equipped with any workable number of telephones.

(To be continued.)

QUERIES

PICKING OUT PAIRS IN CABLE CARRYING BATTERY (831).

How does a cable splicer pick up his pairs on a cable with common battery wires working in it? Suppose he wants to go out and multiple a can on wires that are working with probably 24 volts on the line? Please explain what kind of tests they make? H.

There are a number of methods whereby cable pairs may be tested without disturbing either the subscriber or central office on a common battery system, which, we presume, is what you mean in your third question. We will describe only one, however, which is exceedingly simple and easily understood. In Fig. 831-*b* is shown the circuit arrangement of a test set that may be arranged in very compact form and readily carried by the cable splicer.

In a case where the cable splicer is testing for wires in the cable which are not in use he simply attaches his testing points, which may be a pair of wire clips to a pair of wires, and with his switch on point No. 1 listens in on the line. If he hears conversation he will be at once assured that the line is not a dead one; however, if he hears nothing he may then throw his switch to point No. 2, thereby cutting the buzzer in service and cutting the transmitter out. If the line is entirely open he will not get any noise in his receiver, but if, on the other hand, the line has an instrument on it or is connected at the central office, the secondary circuit of his induction coil will be completed through either the instrument or central office, and he will naturally get a loud buzzing noise.

The current emanating from the secondary side of the induction coil being of an alternating nature will readily pass through the condenser in the subscriber's instrument. The alternations are, however, of such high frequency that the subscriber's bell will not be sensitive enough to be actuated; the central office relay will not be affected either for the same reason. Thus, in the event of the cable tester getting on a line in service he will disturb no one.

If it is desired to make multiple taps on lines already in service, the cable tester will need an assistant either at the central office or at a cable box with a talking set, as shown in Fig. 831-*a*. The assistant will select a pair among those upon which a tap is to be made, and cut in across the pair with his testing points. The cable tester will then test on different pairs with his switch on point No. 1, and talk into his transmitter. As soon as the proper pair is located he will be able to talk to the assistant.

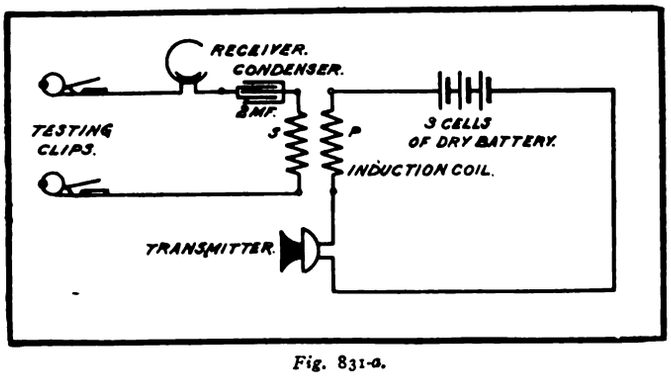

Fig. 831-a.

In the event of testing out a cable in which the pairs are not designated, one test point may be grounded or connected to the cable sheath at each test instrument, thus testing out the wires separately.

If the assistant be one of the genus "pretty much asleep" an occasional throw of the switch to point No. 2 will serve as a gentle reminder for him to get on the job.

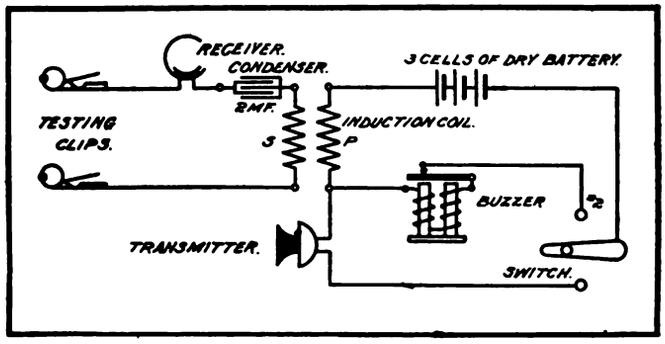

Fig. 831-b.

USE OF TEST RELAY.—(832).

Will you kindly explain to me what is meant by the test relay in a telephone circuit and what it is used for? J. R. B.

The test relay is used, ordinarily, in a trunk circuit, although it is sometimes used in a toll cord circuit to give the operator the customary notification of the busy condition of a line when she touches the sleeve of its jack with the tip of her plug by causing a click to be heard in her telephone receiver. As is well known, in the ordinary subscriber's telephone circuit, this click is produced by the passage of a current directly through the receiver. In a trunk circuit, however, it is necessary to provide an auxiliary device, as the operator's receiver is not bridged directly across the cord circuit, as it is at a subscriber's position. The operator receives all her instructions over a separate circuit known as the order wire circuit and has no occasion to connect her telephone set with the cord circuit over which conversation is passing. The test relay is therefore provided and so wired that when the tip of the plug is connected to the sleeve of a jack associated with a busy wire, the difference in potential which exists, due to the busy condition of the jack tested, causes the operation of the relay. The armature and contacts of this relay are so connected in the operator's telephone circuit that when the relay is energized the desired click is produced in the operator's receiver. The special method of doing this does not greatly matter, as it is accomplished in a considerable variety of ways, such as by short circuiting a section of an induction coil or condenser.

The test relay is usually so connected with the circuit to the tip of the plug as to be connected with it when the trunk is not in use, and as soon as the plug is inserted in the jack, a change in the contacts of another relay, controlling the test relay circuit, disconnects the test relay from the tip and completes the circuit from the tip of the plug to the tip wire which is connected to the subscriber's switchboard at which the call originates.

FACTS CONCERNING OAK AND LOCUST INSULATOR PINS.—(833).

Managers of telephone companies who have used oak and locust insulator pins are invited to send in any facts which they may have observed which will shed light on the question of their comparative life and behavior under loads. The United States Forest Service has made some very interesting tests, the results of which were described in our issue of February 2d. Since that time there have been numerous requests for the experience of practical men with these two kinds of wood. THE AMERICAN TELEPHONE JOURNAL will be glad to receive suggestions from men in the field, which may be published for the benefit of their associates.

THE EDITOR'S PAGE

THE PASSING OF THE BATTERY WAGON.

WHEN we look back at some of the ways things were done in the good old times, and then recall that these methods have somehow been abandoned and nearly forgotten, we don't wonder that the business has grown. A business that would voluntarily renounce those barbarisms ought to grow. The battery with the richly colored fluid for subscribers' stations is an example.

When these were very extensively in use each inspector had to carry a jug in his outfit. Of course, at the present day the man who has to carry a heavy kit of tools, screws, cleats, and, worse than all, a coil of wire, is a victim of a sad destiny. But suppose he still had to carry all this and a good, substantial jug into the bargain. And maybe a glass jar, in slippery weather, along with the jug. Oh, these are easy times for the outside man?

Now, people talk about slow farmers' line development. It's too bad for the farmer, and a sad thing for the town person who likes to order his fresh eggs and vegetables by wire, that the rural telephones have not been giving this service for a longer time. But for the man who renewed the batteries there may be a few compensations, especially where transportation facilities were poor and there was a walk of a mile or two from the lonely railway station, with only the jug for company. It's lucky that it could always be brought back empty.

Then what a trouble this stuff was in a house. If all the instructions could be brought together they would in a very few years be interesting bits of telephone history. Mats and neutralizers, and any quantity of appliances for protecting things from this awful fluid. But if anything broke it always got away. Then the immediate question was how to get the damage repaired and the subscriber mollified before word got in to the manager at the central office. The subscribers in towns used to watch for the wagon that brought the battery renewers with a certain awesome fear, and wonder what would come next. Those were the times when the telephone man had the wholesome respect of subscribers on two scores. He was a chemist and an electrician, and often stood next to the doctor in the estimation of the rural patrons. Still, its a good thing that the battery with the dangerous acid is passing out of use. It was, after all, a very troublesome thing, and it is a wonder that people bore with its inconveniences and expense as patiently as they did.

THE SOURCE OF INVENTIONS.

SPECIALIZATION of effort is productive of the highest efficiency in certain lines of work, but it is sometimes looked upon as the cause of other tendencies in an industry which are not so beneficial. Numerous as are the patents which are from week to week granted on devices intended to come to some use in a portion of the broad telephone field, it is notable that so very large and predominant a proportion should be granted to men connected with the manufacturing rather than the operating companies. There is a very practical advantage in this—namely, that the manufacturing inventor experiences a comparatively trifling difficulty in getting his goods on the market, and, in these days of rapid development, is about as little troubled by the problem of selling them once they are produced. This condition must be one which will have a deterring influence upon the men who cannot give to themselves such assurances of an immediate opportunity to try out the merits of their work, but why it should come so near to keeping them completely away from the field of invention comes very close to being a mystery. In these days there are very few inventions of the "happy thought" type which are likely to be profitable. The things that pay, and pay because they have real merit and represent a real advance, are likely to have been developed slowly. This developing process usually takes the form, in the first place, of an investigation of certain conditions connected with some branch of the telephonic art where the results obtained are so small in proportion to the effort expended as to indicate a low efficiency, and consequent waste. Once the patient developer believes he has a thorough understanding of the things which are and the things which should be, he is ready to start in on his machine. Then the money begins to fly. Is this where the operating men draw back? It doesn't seem right that it should be, for in the long run they are the people who have to pay the bills before the expense gets shifted along to the subscribers. It is a great deal more probable that they are completely cowed by the assumed importance of sticking tightly to their own specialties.

The manufacturing expert has the whole field for his specialty. In order to sell his goods they must be of the sort which will appeal to the man who knows how things should be done, as devices which will help him to accomplish his objects. So the manufacturer is absolutely driven to study the operating side of the industry, and to become so familiar with it that he looks upon it with the eyes of an expert. He sees what it needs. Here he has risen to the level of the expert who has acquired his whole training as an operator. They are for the moment on equal terms. Then the manufacturing engineer steps aside, and after a while comes back to the operating man, who is doing his work in the same old way, and says, "Here is something which will help you to do it better."

Now, if the operating man is where he can be the first to know what is needed, and often tells his friend, the manufacturer, what must be done, why is it that he has not what is practically a head start when it comes to a race in bringing out an improvement? He is just as well able to study mechanical and electrical constructive processes as his neighbor to find out how they are used. Still he lags behind. It is the other man who brings the two kinds of intelligence together and makes them productive. There is a chance for some people to think about this.

A RAP AT MUNICIPAL OWNERSHIP.

IN Chicago a few days ago the committee which is investigating telephone conditions heard the report of a witness who is said to have travelled extensively in Europe and made a careful study of operating conditions there. His statements are said to have been of a nature to throw cold water on the hopes of any persons who have entertainted the idea that Chicago could find a way out of her difficulties by acquiring a telephone system to be operated under government control.

The witness drew attention to the comparatively low development and slow progress made in a large number of countries. In many places, and notably in Paris and some other cities in France, the service is so poor that there is no fairness in comparing it with that given in American cities. It is true that rates in Europe are lower, but this is due to the extremely low wages paid to workmen and operators of all classes.

Even under government ownership, and with no expense for obtaining new business, which is an important factor in American methods, many of the European systems now find themselves in difficulties. In Austria it was recently decided to raise rates to a figure very close to what prevails here.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

PAYMENT FOR FRANCHISE.

Referring to your "The Telephone in the Courts" and invitation contained therein, we submit the following. Section 16 of our franchise reads as follows:

"That said (giving incorporators) guarantees herein, and their assigns, agree that after the passage, and during the life of this ordinance on the 1st day of April of each year they will make a sworn statement and place the same on file with the city clerk of said city, of the gross receipts from rentals received by them or their assigns from their exchange, and will pay into the city treasury of said city two per cent. of the same."

The Bell Company does not pay a dollar into the city treasury under its franchise and is getting about 40 per cent. more for service. Now the wise ones who legislate are not satisfied with what they get from the only corporation which pays them anything, but propose to make us pay 2 per cent. on gross tolls also, when, according to our idea, as no toll lines existed that the framers of the ordinance did not contemplate tolls and certainly did not mention them. Do you know of anything similar? G.

THE ordinance from which you quote certainly does not contemplate a payment of 2 per cent upon tolls, so that any legislation by the city authorities imposing a fee of 2 per cent. on gross tolls would be invalid. The 2 per cent. you pay on gross receipts from rentals is not a tax, but is in the nature of a remuneration to the city for the franchise it has granted you. The granting of a franchise, and your acceptance of it constitutes a contract which is irrevocable by the city, and any further legislation to impose additional burdens upon the telephone company would impair the obligation of the contract, in the sense forbidden by both the State and National Constitutions, and hence be unconstitutional. Hockett vs. State, 105 Ind., 250; 55 A. R., 201.

RIGHT TO ORGANIZE UNDER TELEGRAPH INCORPORATION LAW.

Is a charter granted to a telephone company, under the law providing for a telegraph company, valid? The law provides that corporations may be formed "for the constructing and maintenance of a telegraph line." No mention being made of the telephone. S. A. R.

THE courts usually hold that the term "telegraph" as used in statutes includes "telephone" and that a charter may be granted to a telephone company under the general law authorizing the incorporating of a telegraph company. In one case the court stated the reasons as follows: "They are both designed to convey intelligence between distant places. So far as the owner over whose land their tracks or routes lie, they each are operated with the same appliances. Poles and wires placed alike impose exactly the same servitude upon the land. With the change in the apparatus at the termini, telegraphy becomes telephony. The former makes the distant message intelligible by words, marks or sounds; the latter by sounds alone. The same electric fluid is the medium of transmission, and all the internal structures are the same in both. The corporation employing either means of communication is executing substantially the same public function in substantially the same way."

DAMAGES FOR FAILURE TO GIVE TELEPHONE SERVICE.

A PRACTISING physician in the City of Vicksburg, a subscriber to the telephone service of the Cumberland Telephone & Telegraph Company, brought suit against the company for damages for having his telephone service suspended. He alleged that he had been called by an employee of the company to attend a lineman, and that this employee assured him the company would pay the bill, but that his bill was not paid, and when the company's bill for telephone service was presented, he instructed the collector to have the amount thereof deducted from his bill for professional services to the lineman, which message the collector said he would deliver to the manager. He also averred that he had no notice of the suspension of his telephone service. He brought suit for punitive damages, and for actual damages caused by loss of practice. To prove his loss of practice he was permitted to tell on the witness stand that certain persons whom he named had afterward told him that they had tried to reach him over the telephone to secure his professional services, but found that his line had been cut off. He recovered a judgment which was set aside by the Supreme Court of Kentucky on the ground that the evidence of damages was entirely hearsay. Cumberland Tel, & Tel. Co. vs. Hicks, 42 S., 285.

MINNESOTA VILLAGES MAY EXCLUDE TELEPHONE COMPANIES.

ACCORDING to a decision by Judge Lochren, the Northwestern Telephone Exchange Company has lost its suit to enjoin the city of St. Charles, Minn., from preventing its installing a telephone exchange there.

The court holds that, under the legislative act of 1893, cities and villages have authority to admit or keep out telephone companies as they may desire.

STRIKING EMPLOYEES ENJOINED.

ON petition of the Cumberland Telephone and Telegraph Company, the United States District Court has granted a temporary injunction at Memphis, Tenn., restraining the striking employees of the company from frequenting the buildings or other property of the Cumberland company. The strike of the telephone girls had been carried to other classes of employees and some trouble was feared. A few days after granting the injunction Judge McCall heard the petition for permanent injunction, but dissolved the first injunction, except with reference to two employees. He has since been asked to enjoin members of the Electrical Workers' Union, which has taken up the fight of the girls, from visiting the plants and buildings of the company, but this case has not been disposed of. General Manager Leland Hume, of the Cumberland company, declares that nothing will be conceded the strikers, and that they have all been discharged.

INTERFERENCE WITH FARMERS' LINE AS A MISDEMEANOR.

THE Supreme Court of Missouri has held that an appeal to the Kansas City Court of Appeals is not transferable to the Supreme Court merely because a question is involved as to whether Rev. St., 1899, Section 1261, making it applies to lines owned by individuals. The statute referred to makes it a misdemeanor to interfere with telephone lines. The question was raised in the prosecution for a misdemeanor of Clark McKee and Jesse Allen, who were charged with interfering with a farmers' telephone line, it being owned by a co-partnership. The men were convicted, and had the case removed to the Supreme Court of the State, which refused to interfere and sent it back to the Kansas City Court of Appeals for final decision.

State vs. McKee, 95 S.W., 401.

IN THE OPERATING FIELD

NEW SYSTEM SUCCESSFULLY OPERATING AT STATESVILLE, N. C.

AFTER a vigorous struggle with the Bell Company, the Iredell Telephone Company, at Statesville, N. C., is operating its Independent telephone system with considerable success. Although the service has just been started, there are said to be as many subscribers connected to the Independent lines to-day as the old company, now under Bell control, has obtained since it started in business at this place years ago. It is reported that in many of the business houses and residences the old telephones have been cast aside, and that they have been taken back to the Bell exchange by wagonloads.

The Independent company has among its stockholders and officers the leading business and professional men of the county. Practically all the business men, lawyers and physicians are now subscribers for Independent telephones, and they have also been installed in a large number of residences. The reports of the success of the new company in the telephone field have attracted wide attention in the South. For years the Bell people have tried to get into Statesville, but each time they appeared before the city aldermen they were refused a franchise. The local company which was formerly operated there had a franchise under the terms of which it could not sell to the Bell company. Eventually the owner of this original local system offered it for sale, and being unable to come to satisfactory terms with Statesville people, asked for a new franchise which would enable him to borrow money to continue in business, and enlarge the capacity of the exchange. The new franchise was without the restriction contained in the old one, and the exchange was soon sold to the Bell company. The sale was kept secret for two months, but when knowledge of it eventually came out many people were highly indignant, and steps were immediately taken to organize a company to build a new system. In the mean time the Bell company spent a great deal of money on construction work in an endeavor to stop the proceedings of the new company, and this is the work a part of which is now being taken out.

WORK STARTED ON INDEPENDENT SYSTEM IN WILLIAMSON COUNTY, TENNESSEE.

THE Home Telephone Company has taken quick advantage of the new State law in Tennessee and has begun constructing a county system in Williamson county, Tenn., with Franklin as the central office. For two years the company has endeavored to get into Franklin, but the Cumberland Telephone Company, with various forms of injunctions, has kept it out. The new law in Tennessee permits a "public utility of a general character" to use the streets or public roads anywhere in the State. Ten lines will be run out of Franklin to various points in the county.

CONTINUOUS ADVANCE AGAINST BELL OPPOSITION REPORTED BY COMPANY IN EASTERN NEW YORK.

AT Hoosick Falls, N. Y., the Eastern New York Telephone & Telegraph Company was organized in 1902. Immediately the Bell company attempted by all methods known to keep the Independent concern from building up its business, but its efforts have been wholly in vain. Although, as is the case with all other companies, the Eastern New York Telephone & Telegraph Company occasionally loses a telephone, throughout the entire period of its existence there has only been one interval of three months in which there has not been a net gain. At the present time the company has in the town of Hoosick Falls, with a population of 6,000 people, 425 telephones, and by means of toll connections with the Commercial Union Telephone Company, at Troy, gives service over a wide territory.

Rates for service are $2 per month for a private line, $1.50 for a three party line, and $1 per month for four or more party line service. The company maintains the same capitalization as when organized, $50,000, of which $25,000 is invested. The money was fully subscribed by local people, and the active management is also in the hands of home parties. The officers of the company are: Watson M. Holmes, president; Francis Riley, vice-president; C. B. Story, treasurer; G. Frank Rising, secretary. Much of the success of the company is ascribed by the management to the use of a special party line system with automatic signaling of the central office, and local talking battery, and a lockout feature. This is a service that is especially popular, and cannot be duplicated by the Bell company.

A TELEPHONE SYSTEM IN THE FAR NORTH.

MAIL advices from Skagway tell of a telegraphone system which is now being operated successfully in the Arctic regions. Skagway and White Horse are now connected by a telephone system, which has been installed by the operating department of the White Horse & Yukon R. R., so that Superintendent Hahn can sit in his office and discuss matters with any of his foremen. This system can also be used from any point along the line of railway. The telegraph wire is utilized for this long distance telephone system —the longest one in Southern Alaska. Every train on the system carries an instrument, which can be attached to the telegraph wires and immediate communication obtained by hooking a pole containing two wires over the telegraph line. One of the wires is attached to the instrument in the baggage car, while the other is fixed to the rails to furnish a ground for the return circuit.

INDIANA COMPANY RE-ELECTS SUCCESSFUL MANAGING OFFICERS.

AT Anderson, Ind., the stockholders of the Delaware-Madison County Telephone Company came together from the various cities in which they live, including Indianapolis, Fort Wayne, Muncie, Elwood and Alexandria, for their annual meeting. The annual reports of the officers indicate that the past year has been the most prosperous in the history of the company.

Not only was a dividend declared, but the company is now in a position to take up some important plans for the improvement of its plant and service. A lot in Anderson is to be purchased and a new building erected upon it for the company's exchange, and the extensive rebuilding of the outside plant is to be undertaken. There is now a proposition before the board of directors to purchase a line which will serve as a tributary. The company has now over 4,000 subscribers, and the extension of its lines during the coming year is expected to add many more.

The election of officers resulted in retaining the old board, as follows: President, George W. Beers, Fort Wayne; vice-president, W. H. Quick, Anderson; secretary, T. F. Rose, Muncie; treasurer, W. E. Hitchcock, Muncie, who, with A. L. Johnson, of Muncie, constitute the board of directors. Among the stockholders present were: Messrs. Swift, of Indianapolis; Geo. W. Beers, Max Fisher, W. R. Culbertson, and S. E. Evans, of Fort Wayne; T. F. Rose, W. E. Hitchcock, and E. B. Cod, of Muncie.

GRAY TEL. PAY STATION CO.

HARTFORD, CONN.

OUR '07 CATALOGUE SENT ON REQUEST

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE CHEAP—100 series telephones with Ericsson transmitters and Holtzer-Cabot generators. Good as new. Address R. Valentine, Pres., Independent Telephone Ass'n of Wisconsin, Jamesville, Wis. 783

FOR SALE—500 single pole telephone receivers; 75 Stromberg-Carlson 4-bar hand generators in oak boxes, new; 900 pair 16 ohm electro-magnets, good ones. Auburn Telephone Co., Auburn, N. Y. 792

FOR SALE—Portable gasoline power winch complete: built for pulling cable. Will do the work of five men. A bargain. Write for description. J. W. Wright, 1304 Arch street, Philadelphia, Pa. 797

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

WANTED—First class wire chief for common battery plant, New York State. None but first class man need apply. Address, stating experience and references, Box 785, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 785

WANTED—A young telephone man, college graduate preferred, in the literary department of successful concern. Salary to start will necessary be small, but work offers exceptional opportunity for growth. Address, Box 790, care AMERICAN TELEPHONE JOURNAL, 100 William Street, New York. 787

WANTED---Continued

WANTED—Young college graduate, with some operating or traffic experience, for special work. State full particulars, education and experience. Address, care AMERICAN TELEPHONE JOURNAL, 100 William Street, New York. 789

SIDE LINE—We have an attractive proposition for traveling salesmen calling on telephone exchanges. Vest pocket sample. Address, P. O. Box 374, New Haven Conn. 790

POSITION wanted by all around telephone man as line, instrument, and switchboard troubleman. Capable of managing exchange and construction work. Good reference. Address, Box 793, care American Telephone Journal, 100 William Street, New York. 793

WE are constantly in need of experienced men to work on high grade telephone apparatus, particularly assemblymen. The Wire & Telephone Company of America, Rome, N. Y. 794

WANTED—Wire Chief. Galesburg Union Telephone Company, Galesburg, Ill. 795

CABLE SPLICER wants position. Experienced. Best references. Address, Box 796, care American Telephone Journal, 100 William Street, New York. 796

WANTED—Experienced telephone solicitors. Zenith Telephone Company, Duluth, Minn. 798

WANTED—A man with three years' experience as switchboard installer and four years as Superintendent of Construction, wants a position as Manager or wire chief of a common battery plant. At present employed as installer but is married and desires a local position. West or northwest preferred. Address Box 774, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 774

Poles Must be Anchored

The question is how to do it. Why not adopt the modern D. & T. way?

D. & T. Anchors

can be driven anywhere any time of the year. They pull against solid earth and hold as well as a dead man.

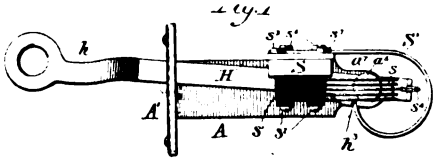
TELEPHONE PATENTS

TELEPHONE HOOK SWITCH.

Ernest W. Brackett, Elyria, O., patents (No. 845,848; dated March 5th, 1907; filed March 31st, 1904; serial No. 200,900) and assigns to the Dean Electric Company, Elyria, O., a telephone hook switch.

The hook switch described in this patent has as a frame a single piece of metal stamped into the shape indicated at *A*, having its transverse front portion bent at right angles to the longitudinal part to support the escutcheon A^1. At the rear end of this frame, at its upper side, a piece is bent over to a horizontal position, and suitably punched to receive the screws which



support a small block in which the switch springs are retained. A pivot pin a^5 is also supported on this frame. The pivot pin is grooved for the reception of a slot in the switch hook *H*. This switch hook is constructed with a slot h^3 adapted to be engaged by the curved spring S^1, one end of which is retained by the machine screws S^3 passing through the horizontal shelf which forms part of the main frame work. This spring engages slot h^3 on the outward side of the hook lever and a little to the left of the pivot, so that it not only tends to throw the forward end of the lever upward, but also to retain it firmly on the pivot.

The contact springs are assembled in parallel relation, with interposed slips of insulating material s^1, and secured by screws s^2 to the metal block *S*. This block in turn is secured to the flange of the frame by screws s^3. Spring s^4, which lies in a slot in the end of the lever, serves to control all the contacts.

TELEPHONE APPARATUS.

Garrison Babcock, Rochester, N. Y., patents (No. 837,534; dated December 4th, 1906; filed August 31st, 1905; serial No. 276,496) and assigns to the Simplex Telephone Equipment Company, Rochester, N. Y., telephone apparatus.

This patent covers a combination of a transmitter and receiver with a battery arranged in a box which is provided with a cut-out switch, and made of such size and shape as to be readily carried in the pocket. The transmitter and receiver are mounted in a single frame, but each is provided with separate cord connections. The instrument is especially adapted for the use of a deaf person, who can receive a communication from another person by handing him the transmitter to speak into while holding the receiver to his own ear.

TELEPHONE HOOK SWITCH.

Ray H. Manson, Elyria, O., patents (No. 846,120; dated March 5th, 1907; filed March 31st, 1904; renewed January 30th, 1907; serial No. 354,910) and assigns to the Dean Electric Company, Elyria, O., a telephone hook switch.

This patent covers a method of controlling the movement of a switch hook lever mounted on a frame, and used in connection with a group of springs, of a type similar to that described in patent No. 845,848. In this mechanism, however, the curved spring acts upon a stub lever pivoted upon the same pin as the hook lever. This stub lever extends forward between the hook lever and its frame. At a point in front of the forward end of the switch springs the stub lever has a projecting member extending at right angles to the frame beneath the hook lever, with notches in which it is adapted to engage. This construction when once the hook lever has engaged the pivot, and been engaged by the stub lever, makes it impossible to withdraw the hook lever from the outside of the case, but it may be very readily removed from the inside of the case by depressing the spring actuated stub lever. This allows the hook lever to be very easily removed without the use of tools, when such action is desirable to facilitate the packing of instruments for shipment.

SUBSCRIBER'S BUSY SIGNAL.

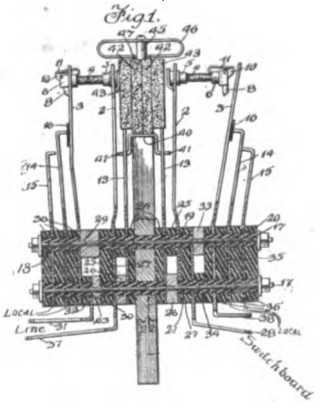
Isidor Kitsee, Philadelphia, Pa., patents (No. 844,811; dated February 19th, 1907; filed October 14th, 1905; serial No. 282,817) a subscriber's busy signal.

The inventor proposes to install a device at each subscriber's station on a party line which will indicate at any time whether the line is busy or free. To do this on a common battery system he describes a method of bridging a high resistance coil of not less than fifty thousand ohms across the hook contacts. When the line is in use coils at all stations will be short circuited and an annunciator mechanism connected to the armature will show that the line is busy. At times when the line is not short circuited through the closure of the contacts at the hook switch all signals will be receiving current from the battery, their armatures will be attracted and the "free" signal will be displayed.

ELECTRICAL PROTECTIVE APPARATUS.

Charles A. Rolfe, Rochester, N. Y., patents (No. 845,010; dated February 19th, 1907; original application filed April 21st, 1902; serial No. 104,021; divided and this application filed February 4th, 1905; serial No. 244,238) and assigns to the Rolfe Electric Company, Rochester, N. Y., electrical protective apparatus.

This patent covers a method of mounting protective devices



described in the same inventor's patent serial No. 104,021. A supporting plate 1 has mounted upon it a combination of springs holding the operative parts of the protector, the whole being secured in place by screws 17, 17. Spring arms 2 2, 3 3, support heat cartridges, which are so mounted as to prevent the springs from flying apart owing to the tension under which they are placed. The heat cartridges consist of a graphite stick 4, supported between caps 5, 6, each of which is slotted to engage a corresponding supporting spring. Cap 6 has a swinging piece

PATENTS—Continued.

8 mounted in a vertical slot in the middle of the end. This is normally retained in position by soft solder. When a heavy current passes through the cartridge it heats the graphite, melts this soft solder and allows the piece 8 to turn, releasing spring 3, which flies outward. The immediate action of spring 11 upon projection 10 causes piece 8 to return to its original position.

COIN COLLECTOR.

Frank R. McBerty, Evanston, Ill., and James L. McQuarrie, Chicago, Ill., patent (No. 845,370; dated February 26th, 1907; filed January 23d, 1903; secial No. 140,266) and assign to the Western Electric Company, Chicago, Ill., a coin collector.

This patent covers a method of handling pay station calls which requires that before the user of a telephone instrument can call an operator he must deposit a coin. If connection is made this coin comes under the control of the operator, but if no connection is obtained the control is retained by the subscriber, who may cause the mechanism to return the coin to him. The mechanism of the box is fully described in another patent. Its main features consist of a magnet *a*, having an armature which may be partially or fully attracted to its pole, according to the strength of the current passing through it. This armature controls stops in the path of the coin. In operation when the subscriber removes his telephone from the hook and deposits a coin, if the line is already busy magnet *a* will be excited by current from either battery *b* or b^1 at the central office; the armature will be drawn up and the stops removed from the path of the coin, allowing it to slip completely through the apparatus to the open slot from which it may be recovered. Ordinarily, however, the magnet will not be excited, and the coin will strike the stops, which causes it to be retained within the box. It will close the contacts c^1, thus completing the circuit from conductor 1 to ground through conductor 3, causing the line lamp to be lighted, and also operating magnet *a*. The result of this is that the stops are removed from the coin chute, so that any coin subsequently deposited will simply pass through the chute and be returned. Also the relay contact a^3 will be closed, and close shunt 4, maintaining circuit through the magnet independent of the coin actuated contact c^1; also the stop carried by arm a^1 will be moved into the path of the plunger by which the subscriber may under proper circumstances cause his coin to be restored, so that this plunger cannot at this time be operated.

Until the operator answers the supply of current to magnet *a* can be cut off at contacts a^3 and c^1, and the subscriber may then recover his coin; but when the operator plugs in battery b^1

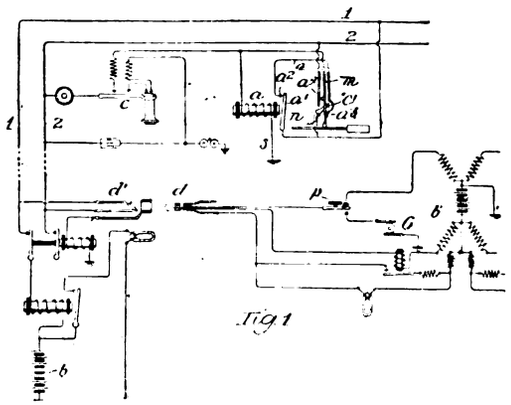

Fig 1

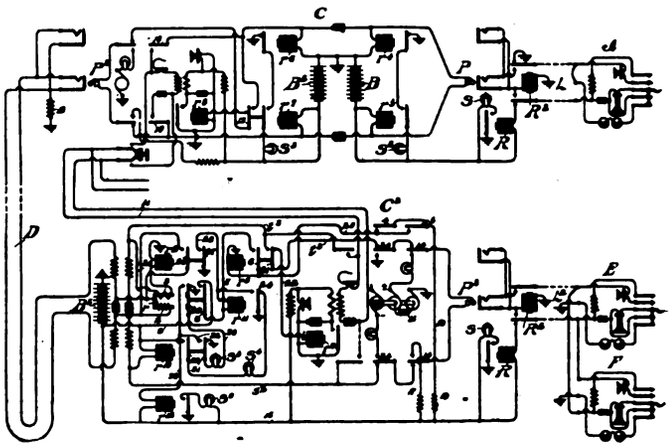
is applied to limb 2 of the telephone line, and the initial movement of the plunger will connect magnet *a* direct with this limb 2 at contact a^4, so that the magnet will remain excited to lock the refunding mechanism.

After the connection is completed, if the coin is to be deposited the operator will apply a special strong current from generator *G* by depressing key *p*. Magnet *a* will become strongly excited, drawing up its armature, and allow the coin to pass into the coin box. If the coin is to be returned the operator will tell the subscriber to wait a minute and then push the restoring button. She then takes down the connection, after which the subscriber by pressing the button may break the contact a^3, releasing magnet *a* and effecting other changes which cause the coin to be restored.

TELEPHONE TRUNKING SYSTEM.

William W. Dean, Chicago, Ill., patents (No. 841,769; dated January 22nd, 1907; filed February 6th, 1903; serial No. 142,114) and assigns to the Kellogg Switchboard & Supply Company, Chicago, Ill., a telephone trunking system.

In this system, which is of the general type of certain previous systems designed by the same inventor, there is included a test



relay r^5, adapted to be controlled by an auxiliary relay r^3. This auxiliary relay is initially energized from battery B^3 on the actuation of the ringing key, and is thereafter controlled through its spring 6, and a locking circuit extending through spring 8 of the trunk relay *r* to negative battery. When the trunk operator rings on a line the trunk relay *r* is already actuated through its high resistance winding 2, and therefore the auxiliary relay *r* remains actuated after the ringing key is returned to normal position. When it is actuated it disconnects test relay r^5, connects the tip circuit through from the plug to the repeating coil, by spring 21. When the called subscriber answers tip relay r^2 is operated, short circuiting the high resistance winding 2 of relay *r*, but keeping the auxiliary relay r^3 actuated through low resistance winding 3. The auxiliary relay is thus maintained in its energized condition until the subscriber and the A operator disconnect.

ELECTROTHERMAL CUT-OUT.

Frank B. Cook, Chicago, Ill., patents (No. 845,219, dated February 26th, 1907; filed April 16th, 1906; serial No. 311,992) an electrothermal cut-out.

In this cut-out the heating element consists of a cylinder of graphite, to which are secured conducting end caps, preferably attached by electroplating the ends of the graphite and soldering the caps to it with hard solder. One end cap is provided with a threaded stem, which may be secured into a rigid supporting member. The other end cap is provided with an extension having an annular recess adapted to receive the free end of a spring member. This member is placed in engagement with the ring in the cap, being then under tension, and is held in position by some insulating or cementing material, such as a suitable kind of wax.

When a strong electric current is passed through the device and the supporting members forming the terminals of the circuit, the graphite is heated until the wax is melted, permitting the spring member to separate itself from the cap of the heating element, thus breaking the circuit.

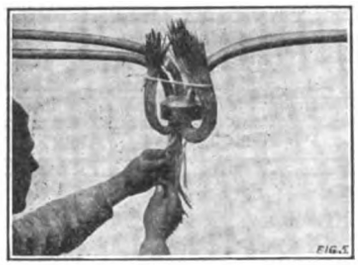
A MONEY SAVER S



A MONEY SAVER S

YOUR TIME

will earn money in direct proportion to your use of it. The use of the Hargis Cable Splicing Joint will enable you to save time. It will enable your regular linemen to make a better splice than an expert cable man. The picture above shows how easy it is to splice pairs by means of the Hargis Joint. They can all be tied out of the way while the splicing is going on.

The Hargis Joint is not a wiped joint in any sense of the word. The cables are simply put thru the cap and lead gasket and the lead is then poured in until the cup formed by the gasket and the brass cap is full. What wiping is done is simply to smooth off the rough edges, and does not add to the weather-resisting qualities of the joint.

HOW TO SAVE YOUR TIME

Let us send you descriptive matter of the Hargis Cable Splicing Joint shown above. By its use you can make a better splice in less than one half the time it takes to make a horizontal wiped joint, and at the same time you can always get into it by means of special tools to test out for trouble along the line.

It will pay you to write for our descriptive matter.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

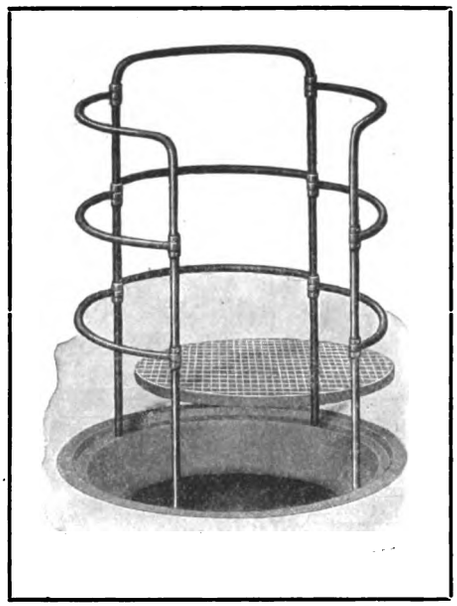
GUARD RAIL FOR PROTECTION OF MANHOLES.

PROTECTION to workmen in the manholes and horses and pedestrians on the street is assured by the new manhole guard rail, an illustration of which appears on this page. It is always a provoking problem to the construction foreman to provide such protection and the use of rail fences for this purpose has been abandoned by all progressive and popular companies. Makeshifts such as this not only do not protect, but they cost more in the end—in time and labor principally. Above all they are unsightly and usually provoke to wrath the traveling citizen who is, of course, the company's means of existence. It has been found profitable to remind these citizens as little as possible of the existence of channels of communication on or under their streets—unless it can be done in a manner favorable to the public service corporation.

For manhole guards recourse was usually had to the village blacksmith or iron master who constructed one of pipes—after a fashion. Maybe the plumber could do it, if he would.

But be that as it may, it is probable that many long-suffering telephone managers will be glad to learn that the Colman J. Mullin Company has specialized on the subject with good results.

The Mullin Company dwells particularly on the fact that this guard rail is made strong, light and that it is readily interchangeable from one manhole to another. Also that it insures a perfect guard and protection while the splicer or other workman is in the well-hole. Prices and catalogues describing this and other well-known Mullin telephone construction specialties may be had by addressing the Colman J. Mullin Company, 430 Kent avenue, Brooklyn, N. Y.



Manhole Guard Rail Made by the Colman J. Mullin Co.

WAGNER MOTOR CYCLE COMPANY, St. Paul, Minn., has a special proposition to make to telephone managers for the placing of the Wagner motorcycle for use of telephone trouble and repair men.

F. E. KOHLER & COMPANY, Canton, O., manufacture the universal post hole digger, which is claimed to be just the thing for digging holes to take telephone poles. Advantages mentioned are that it is strong and durable, easily operated, works in all kinds of soil, saves time and money in planting poles. Particulars will be sent on receipt of a request.

FRANK F. HOWE, 502 The Arcade, Cleveland, Ohio, has a patent on a new magneto telephone with novel features. A postal card addressed to Mr. Howe will bring a leaflet explaining why a new company is contemplated among telephone officials for the manufacture, use and sale of them.

THE CENTRAL ELECTRIC COMPANY, Chicago, Ill., makes a point to see that all orders calling for regular material that are received before noon are shipped the same day received. Such prompt attention will be greatly appreciated by the manager in a rush for stock materials.

M. W. DUNTON & Co., Providence, R. I., send free a sample of Nokorode soldering paste sufficient to solder 100 joints.

SOUTHERN MANUFACTURER IS GIVING AWAY SWITCHBOARDS TO ENCOURAGE USE OF TELEPHONES.

IT is seldom that a company gives away a switchboard, but this is what the Sumter Telephone Manufacturing Company, of Sumter, S. C., is doing for a limited time only.

Upon receipt of a letter from those interested in modern telephone equipment, it will be pleased to ship one of its Unitype switchboards complete, ready for use every day in the year.

The instrument above referred to is a very neat and attractive calendar in the exact shape of a modern switchboard. It is adapted to stand on the desk or writing table, and being printed in imitation oak it really represents a miniature switchboard which is useful every day in the year.

JULIUS ANDRAE & SONS COMPANY, 99 West Water street, Milwaukee, Wis., has prepared a folder showing the actual appearance of each different type of telephone which it manufactures. It also brings out some interesting details of generators, ringers, hook switches, etc., embodied in these instruments.

This small folder has upon its cover the statement, "A Good Telephone Costs Only Its Original Price. You Never Get Through Paying for a Cheap One." From the appearance of the instruments made by the company it would appear that it has made this statement its motto, and is doing well in an effort to live up to it.

SOMETHING NEW IN CONDUITS.

A NEW feature in the manufacture of conduits is the application of certain scientific methods whereby a better quality of ducts is produced and uniformity of grade is maintained. The result is a great satisfaction to the engineer because he gets properly vitrified ducts, thoroughly salt glazed, free from cracks, straight, and non-absorptive. With thirty-five years' experience and modern methods the Rochester Sewer Pipe Company is doing this with great success. But it does even more with its effective organization: every duct is most rigidly inspected both before and after burning, all defective ones being rejected; then they are carefully loaded and blocked in cars and breakage claims are said to be unheard of. Engineers contemplating underground work which they want to last and be first class will do well to address the ROCHESTER SEWER PIPE COMPANY, Rochester, N. Y.

M. C. STONE, Washington, D. C., manufactures seamless paper sleeves, particularly well adapted to telephone cable splicing.

ST. PAUL ELECTRIC CO., St. Paul, Minn., carries 2,000,000 linear feet of Washington fir cross-arms in stock at St. Paul, which is a convenient distributing point. The company carries also a full line of construction material.

INDIANA STEEL & WIRE COMPANY, Muncie, Ind., will send samples of wire and prices to purchasers. Their grade of wire, it is said, has been tested with satisfactory results at leading technical schools and has stood most exacting tests by large telephone companies.

The New Factory of the Century Telephone Construction Company at Buffalo, N. Y.

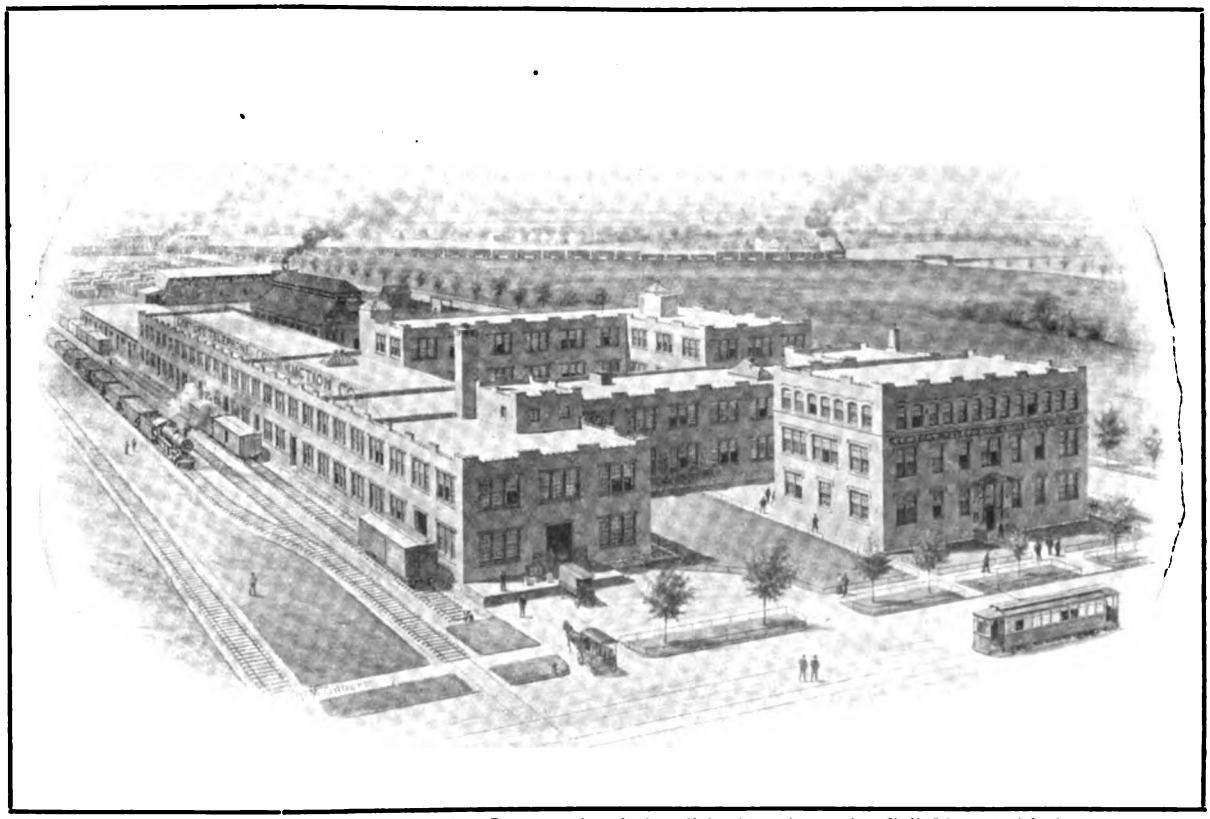
LAST Fall, while the Century Telephone Construction Company was keeping its factory at Buffalo, N. Y., running to its very fullest capacity, it was, on October 6, entirely destroyed by fire. At that time the company was not only engaged upon important work, a large proportion of which was lost in the fire, which burned down the buildings and destroyed the machinery, but also had upon its books many orders which were to be taken up as soon as they could be reached in the course of manufacture. So great was the desire of the company to hasten the completion of the work covering all these orders, on account of the rapid growth of the operating companies which had given them, that it was considered necessary that temporary quarters should be secured and fitted up at the earliest possible date. The management of the company lost no time in taking the necessary action, and within a few days it had not only taken an appropriate temporary factory in Buffalo, but had purchased the stock and equipment of the Williams-Abbott Electric Company, of Cleveland, Ohio. The promptness of this action has been very much appreciated by the customers of the company, who have suffered very little delay in the receipt of their material.

Although the company secured fairly successful results in getting work done under this divided arrangement, it was, of course, an insufficient and unsatisfactory way to handle the entire business of a large concern, and work upon the fitting up of a new factory has been vigorously pushed, having been begun a few days after the destruction of the old building. The company is now almost ready to occupy a new plant, in which it has ample facilities for handling every branch of its work. The buildings are of fireproof construction throughout, and are thoroughly well equipped for every class of manufacture which the company undertakes. These buildings, shown in the accompanying illustration, will be entirely occupied by the Century company. Their location is especially convenient from all points of view, as they are on Elmwood Ave., near Hertel, where they may be quickly reached by visitors to Buffalo via the Elmwood cars.

Equipment is being provided to take care of the manufacture of a complete line of high grade magneto and common battery telephone switchboards and supplies. These lines include the well known Century platinum electrode transmitters, direct current selective systems, private branch exchange and intercommunicating systems, as well as common battery switchboards and telephones, and magneto switchboards and telephones, with special supplies for rural systems which the company manufactures.

In addition to its own well established lines, which have been sold in large quantities throughout the country, the company will now continue to manufacture the supplies formerly handled by the Willams-Abbott Company, and preparations are being made for adding to both of these lines, considerably broadening the scope of the field in which the company will be interested. The entire factory will be fully occupied about May 1, and at that time the company announces that it will be ready and able to handle the manufacture of switchboards of any size and capacity, and all material in any of its other lines in whatever quantities may be desired. Not only will the company manufacture switchboards, but its engineering department is prepared to co-operate in the fullest manner with those who are considering the installation of telephone apparatus. This branch of the organization makes a practice of answering all questions concerning practical telephone work, this service being performed free of charge, and open to any telephone company or manager. Those who wish to take advantage of it have only to forward their inquiries to the company.

The new factory is so located that every advantage in the way of shipping facilities is obtained, and the careful layout of its interior is expected to make it possible to complete and ship orders within a very satisfactory period. As all the forces of the company have been kept busy in the temporary factories, since the destruction of the plant, upon the work of getting out orders then in hand, the organization remains unimpaired, and the company will be able to maintain the same standard of construction which has been so favorably received in the past without the slightest break or inconvenience. At the present time the company is prepared to give full information concerning any of its separate lines of goods, and to take up the consideration of orders of any size.



New Fatcory of the Century Telephone Construction Company, in which will be Manufactured a Full Line of Telephone Instruments and Switchboards.

NEW COMPANIES.

YAMPA, COLO.—Articles of incorporation have been filed by the Yampa Telephone Company. It has an authorized capital stock of $10,000 and the incorporators are Arnold Powell, J. B. Male and A. C. Bower.

NEW ATHENS, ILL.—New Athens-Tomorroway Telephone Association has been incorporated with a capital stock of $300. The incorporators are Frank Reisert, John Koch and Fred Stenzel.

PLUM HILL, ILL.—The Plum Hill and Stone Church Telephone Company has been incorporated with a capital stock of $805. Among the incorporators are Henry Sachtelben, John Brinkman and F. H. Luessenheide.

BLOOMINGTON, IND.—The Farmers' Telephone Company has filed articles of incorporation. The capital stock is placed at $2,000 and the following directors have been elected: John Knight, Morton Payne and W. R. Smith.

DUNKERTON, IA.—Articles of incorporation have been filed by the North Dunkerton Telephone Company. The capital stock is placed at $5,000, and the present officers are: President, Thomas Dunkerton; vice-president, H. H. Meyers; secretary and treasurer, F. C. Dunkerton. Directors are Charles Northrup, Fred Schoof and Early Bartholomew.

CROFTON, KY.—Articles of incorporation have been filed by the Crofton and Brushy Fork Telephone Company, the amount of the capital stock being given as $200. Among the incorporators are J. C. Adams, W. L. Goode, J. H. Adams, S. A. Martin, Barney Martin, J. H. Pyle, W. R. Jones and M. Haley.

HANCOCK, MICH.—An Independent telephone company is being organized by the citizens and business men of Hancock. Already $10,000 has been subscribed and it is expected that the capital stock will be increased to $50,000.

MILAN, MINN.—A Farmers' Telephone Company has been organized at Milan, and the following officers elected: L. H. Dalen, president; H. A. Sorenson, vice-president; A. O. Christenson, secretary; T. H. Johnson, treasurer.

MORRILL, MINN.—The Farmers' Telephone Company has been formed by farmers living in the vicinity of Morrill. It is the company's intention to build lines in Morrison County.

HINSDALE, N. Y.—The Hinsdale Telephone Company, with a capital stock of $5,000, has filed articles of incorporation. Among the directors are G. S. Beebe, B. L. Moore, Hugh Taylor, of Buffalo.

SOUTH NEW BERLIN, N. Y.—At a meeting recently held near Gilbertsville an Independent Telephone Company was formed to build a line from South New Berlin to Gilbertsville. The name of the new company is the South New Berlin-Gilbertsville Telephone Company, and the following officers have been elected: President, A. Breffle; vice-president, Thomas Stenson; secretary and treasurer, Samuel Misson.

SMITHFIELD, N. C.—The Johnston County Telephone Company has been incorporated with a capital stock of $10,000. Lines are to be built throughout the county and an up-to-date exchange installed at Smithfield.

JERUSALEM, O.—The farmers of Jerusalem have organized an Independent Telephone Company, to be known as the Jerusalem Telephone Company, with C. H. McFrederick as president; I. B. Carleton, vice-president; B. F. Cureton, secretary; W. W. Mellott, treasurer.

NORWICH, O.—The Norwich Mutual Telephone Company has been organized with the following officers: President, E. C. Ledman; vice-president, J. A. Henderson; treasurer, Frank Haddon; secretary, W. C. Geyer.

NOVA, O.—Articles of incorporation have been filed by the Nova Telephone Company. It has an authorized capital stock of $500, and J. J. Dieter and others are among the incorporators.

TAUPA, OKLA.—The Farmers' Mutual Telephone Company has been incorporated with a capital stock of $5,000. Among the directors are W. S. Kennedy, R. R. Childers, of Taupa; and C. C. Naylor, of Lawton.

BRADLEYTOWN, PA.—An Independent telephone company has been organized at Bradleytown, whose intention it is to build lines to connect with the Petroleum Telephone Company at Wyattville.

EL PASO, TEX.—Articles of incorporation have been filed by the Pioneer Telephone Company. The capital stock is given at $1,000, and the incorporators are William E. and Lewis C. Kindon and Charles C. Brown.

WINTERS, TEXAS.—An Independent telephone company, which has an authorized capital stock of $10,000, has been organized to take over the local plant at Winters. About $2,000 will be spent at once in improvements.

YALE, TEXAS.—The Yale Telephone Company, with a capital stock of $25,000, has filed articles of incorporation. The incorporators are West Keeler, Thaddeus Wilbur and S. J. Spencer.

NEW LISBON, WIS.—The New Lisbon Mutual Telephone Company has been incorporated with a capital stock of $5,000. The incorporators are Albert Klibker, Geo. L. Heath and J. D. Strickland.

RIDGEWAY, WIS.—The Arena & Ridgeway Telephone Company, Ridgeway, has been incorporated with a capital stock of $3,000. Among the incorporators are A. W. McKenzie, A. Hamilton and S. W. Dawson.

MONTEREY, MEX.—An Independent Telephone Company has been formed by Monterey capitalists, whose intention it is to construct lines between the towns of Montemorelos and Reyones. Work will be commenced in a very short time.

FRANCHISES.

MT. ETNA, IND.—Application for a franchise at Mt. Etna has been made by the Majenica Telephone Company, of Majenica.

TABOR, IA.—Application for a franchise has been made by the City Telephone Company.

MIDDLEBORO, MASS.—The Home Automatic Telephone Company has been granted a franchise to operate in this city. A line is to be built from Brockton to New Bedford through Middleboro.

SAGINAW, MICH.—After determined opposition by the Bell Company, the Valley Telephone Company has been granted a new franchise by the city council. The Valley company has increased its capital stock and purposes to install a complete plant.

CLINTON, MO.—The Home Telephone Company, represented by J. H. Kyle, has applied for a franchise at Clinton. The men behind the new concern are both foreign and local capitalists.

WEST PLAINS, MO.—A telephone franchise has been granted to H. F. Gundy at West Plains.

NORWOOD STA., CINCINNATI, O.—The Cincinnati Independent Telephone Company has renewed its application for a franchise.

CHARLEROI, PA.—Application for a franchise to operate in Charleroi has been made by the Union Telephone Company. The company will also give service to Pittsburg, and later will apply for a franchise at Donora.

LOCKHART, TEXAS.—A franchise has been granted by the commissioner's court to N. P. Ridout to construct and maintain a telephone line from Lockhart to Cibolo and to other points.

FINANCIAL.

SANTA BARBARA, CAL.—The stockholders of the Home Telephone & Telegraph Co. are considering the advisability of increasing the capital stock from $200,000 to $300,000.

CHOTEAU, MONTANA.—It is the intention of the Montana Telephone Company to increase its capital stock from $2,400 to $2,500.

BEATRICE, NEB.—The capital stock of the Filley Independent Telephone Company has been increased from $3,000 to $9,000 in order to improve the company's plant.

CEDAR GROVE, WIS.—The Cedar Grove Telephone Company has increased its capital stock from $3,000 to $5,000.

JACKSON, WIS.—The Jackson Telephone Company has increased its capital stock from $2,000 to $4,000.

COMBINATIONS.

COLVILLE, WASH.—Plans are under way to consolidate all the Independent telephone lines in Stevens County and establish exchanges at Chewelah, Colville, Marcus and Northport.

CALEDONIA, ONT., CAN.—The local Independent telephone companies operating in Caledonia, Hagersville, Dunnville and other places have been consolidated under the name of the Dunnville Consolidated Telephone Company, Ltd. The new company has obtained a charter empowering it to build and maintain lines in the county of Haldimand and in the townships in Welland, Lincoln, Went and Brant counties.

NEWS—WANTED

THE matter contained upon the message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

THE WEEK'S MESSAGES

ELECTIONS.

IDA GROVE, IA.—At the annual meeting of the Ida County Farmers' Mutual Telephone Company the following officers were elected: President, R. E. Todd; vice-president, J. I. Hess; secretary, W. C. Forney; treasurer, A. A. Rauch; assistant secretary, W. S. Young.

LEWISTON, ME.—The following officers and directors have been elected by the Lewiston-Auburn Telephone Company: Thos. R. Brooks, president; F. E. Ebersole, vice-president and general manager; Edwin W. Gearhart, treasurer; L. B. Hillard, W. H. Newell, Thos. R. Brooks, E. W. Gearhart and F. E. Ebersole, directors.

PORTLAND, ME.—At a recent meeting at Portland, Me., the stockholders of the Northeastern Telephone Company and the Cumberland Telephone Company elected the following officers for the ensuing year: Thos. R. Brooks, president; F. E. Ebersole, vice-president and manager; Edwin W. Gearhart, treasurer.

RICHMOND, MASS.—The Richmond Co-operative Telephone Company has named F. A. Clement president and general manager, S. M. Loveland vice-president and J. R. Ayer treasurer.

FREMONT, O.—The following officers have been elected by the Fremont Home Telephone Company: R. J. Christy, president; J. G. Hunt, vice-president; J. M. Sherman, treasurer; Geo. Seamans, secretary and general manager.

OLD FORT, O.—The Mutual Telephone Company has elected R. G. Shannon, president; C. J. Fry, vice-president; C. C. Drown, treasurer; C. I. Anders, secretary.

ALPENA, S. D.—The new officers of the Cain Creek Telephone Company are: President, Frank Lyons; vice president, Wm. Bransted; secretary, W. Ross; treasurer, C. Vandagrift.

BUTLER, S. D.—The stockholders of the Butler Telephone Company at their annual meeting elected the following officers: President, L. C. Goodell; vice president, J. H. Mulberry; secretary and treasurer, N. E. Bjerke.

HERMOSA, S D.—The following officers have been elected by the Hermosa Telephone Company: President, O. A. Glidden; vice president, John Hanson; secretary, S. M. Booth; treasurer, E. Stenger.

PERSONAL.

HARRY KELLY has been appointed manager of the Inter-State Telephone Company's exchange at Dundee, Ill.

ROY McCOY has been appointed manager of the Citizens Telephone Company, at Fairmount, Ind.

E. H. McFALL has been promoted to the position of manager of the exchange of the Missouri and Kansas Telephone Company, at Hutchinson, Kas.

W. C. PENFIELD has been appointed manager of the exchange of the Missouri & Kansas Telephone Company at Chanute, Kan.

T. F. SARGENT, formerly manager of the Inter-State Telephone Company, at Sterling, Ill., has resigned to take charge of the plant of the Shreveport Telephone Company, Shreveport, La.

W. H. SHORT has been appointed manager of the Southern New York Telephone Company's system in the district which includes Marlborough, Highland, Milton and New Paltz, N. Y.

HOMER SMITH has resigned his position as superintendent of the Citizens' Telephone Company at Crestline, Ohio, to take charge of the Citizens' Telephone Company of Clermont county at Batavia.

W. H. SULLIVAN has been promoted by the Michigan State Telephone Company to the position of district manager, with headquarters at Holly, Mich.

R. L. THORNTON has been appointed manager of the exchange of the East Tennessee Telephone Company at Bristol, Tenn.

W. BRANCH WAINWRIGHT, who for several years has been manager of a district of the Diamond State Telephone Company, with headquarters at Salisbury, Md., has been appointed general traffic manager, with headquarters at Dover, Del.

D. C. YOUNG has been appointed manager of the exchange of the Darien Telephone Company, at Darien, N. Y.

New Construction in the Field

ADGER, ALA.—A line from Adger to Virginia City is being constructed by the North Johns Telephone Company.

TUCSON, ARIZ.—Lines are being constructed by the Consolidated Telephone, Telegraph and Electric Company connecting Tucson with Benson, Bisbee, Douglas, Naco, Tombstone and Cananea. The company is also building long-distance lines from Benson to Cochise and Wilcox.

EMINGTON, ILL.—A new switchboard has been installed by the Emington Telephone Company.

FREEPORT, ILL.—It is the intention of the Northwestern Telephone and Telegraph Company, recently incorporated, to expend about $90,000 in the construction of its system. Among the cities to which lines will be built are Rock Island, Moline, Davenport, Dubuque, Galena, Warren, Rockford, Mt. Carroll, Oregon, Dixon, Sterling and Clinton.

UPPER ALTON, ILL.—It is the intention of the Star Telephone & Telegraph Company to expend a considerable sum of money in extending its lines, and in making its system thoroughly up-to-date.

FORT WAYNE, IND.—Extensive improvements in the way of the installation of new switchboards and the extension of lines to connect with other exchanges are under consideration by the Farmers' Mutual Telephone Co.

LA PORTE, IND.—A new exchange building is to be erected by the La Porte Telephone Company to take care of its increasing business.

McCUTCHANVILLE, IND.—Considerable new construction work is being planned by the Southern Indiana Telephone Company.

ROANOKE, IND.—A new switchboard is to be installed by the Roanoke Telephone Company and many other improvements in its system are contemplated.

ALBIA, IA.—The Acme Telephone Company expects to greatly increase the capacity of its plants by the erection of a new exchange building.

NORA SPRINGS, IA.—The Portage Heights Telephone Company expects to build new lines.

STOCKTON, IA.—The Stockton & Walcott Telephone Company is completing the construction of its system between Stockton and Walcott.

KANSAS CITY, KAS.—The Home Telephone Company has under consideration the erection of a line from Kansas City to Muskogee, I. T. This will take in all the towns along the Santa Fe to Tulsa, and from there it will be built along the Midland Valley right of way. Operations are to begin at once.

VERNON, KAS.—The Barry County Mutual Telephone Company contemplates the construction of new lines to Cassville, Purdy, Verona, Scholten, Cato and other points.

BROCKTON, MASS.—The Home Automatic Telephone Company, which has been granted a franchise at this place, will shortly commence the installation of its system.

SEBEKA, MINN.—Many new lines are to be built by the Sebeka Telephone Company.

LIBERTY, MO.—It is the intention of the Clay County Telephone Company to establish an exchange at Liberty, and to connect with Holt, Kearney, Smithville, Excelsior Springs and other towns in the county.

BEATRICE, NEB.—It is the intention of the German Telephone Company to make many improvements in its plant, among which will be the installation of a new switchboard.

ROCKFORD, NEB.—The lines of the New Home Telephone Company are to be extended in Rockford.

WYMORE, NEB.—A strictly up-to-date plant is being established by the Home Telephone Company, of Beatrice, at Wymore.

MILAN, N. Y.—The lines of the Columbia Telephone Company are to be extended in Milan and a new line to Rhinebeck is being considered.

ROXBURY, N. Y.—The Rose Telephone Company, which has just completed a line from Halcottsville to Roxbury, expects to extend its system to Hobart and other points.

WILLOW POINT, N. Y.—The York State Telephone Company has extended its lines to Willow Point.

BERGHOLZ, O.—The Bergholz Telephone Company, which operates lines between Bergholz and Malvern, contemplates the erection of a new line to Canton.

DORSET, O.—The Dorset Telephone Company, which has recently increased its capital stock from $3,000 to $10,000, expects to spend the money in building new trunk lines.

NEW LEXINGTON, O.—The Citizens' Telephone Company, whose stock has recently been materially increased, contemplates the installation of a central energy system and also intends to build lines throughout Perry County.

SHANE, O.—New lines are being built by the Bacon Ridge Telephone Company from Shane to Circlegreen.

WARREN, O.—Among the new lines being constructed by the Warren & Niles Telephone Company is one to Newton Falls.

JOHNSTOWN, PA.—New wires are to be strung by the Johnstown Telephone Company to Altoona, Harrisburg, Lancaster and Philadelphia.

RAINY RIVER, ONT., CAN.—The Rainy River International Telephone Co. expects to extend its lines from Rainy River to Fort Francis, a distance of about 55 miles.

JUST A SUGGESTION

Take one of your busy 4-party lines and equip it with "POOLE" Lock-Outs. Leave it in service a month and then see how many of the four will stand a raise of $3.00 a year rather than go back to the old way. We know the answer, but we want your subscribers to impress on you the fact that the "POOLE" Lock-Out is a rate-raiser.

It won't cost you anything to try it, because we will loan you the Lock-Outs free and there is no other equipment required. Write today for our Booklet AL-2.

Stromberg-Carlson Telephone Mfg. Company

Rochester, N. Y. March 23, 1907.

TO THE EXCHANGE MANAGER AND TELEPHONE USER:

Another enemy to CORD TROUBLE is the STROMBERG-CARLSON Steel Conductor Switchboard Cord.

This is another form of strong and durable cord for switchboard use.

- SPECIFICATION -

First Conductor:- A heavy linen string of our own manufacture on which is formed a #26 Tinned Steel Wire in a right hand direction. Double left hand serving 24 ends Tussah Silk and braiding of #40 - 2 ply cotton, 16 spindles 2 threads, and finally a braiding of #35 - 2 ply linen, 16 spindles 2 threads.

Second Conductor:- Over this conductor is formed a #26 Tinned Steel Wire in a left hand direction, and a double right hand serving 24 ends of Tussah Silk. The external braiding is of #35 - 2 ply linen, 32 spindles 1 thread.

We will be pleased to have you try these cords. They are so "tough" they will surprise you.

Have you learned all about our new prices for Receiver and Desk Telephone Cords?

Yours very truly,

TO BE FOREWARNED IS TO BE FOREARMED

If you are not using a measuring instrument to test your lines, get one at once, as you will need it many times before the summer comes. It would be just as sensible for a grocer to try and sell sugar by guessing at its weight as it is for you to try to locate a fault in a line by the same method. PIGNOLET VOLT-AMMETERS are designed to give the best results required for testing purposes. They are not complicated nor do they require experts to operate them. Another point in their favor is their low cost. There is no instrument on the market which will give you as accurate results at anything near the price. Hadn't you better write for prices and further particulars By buying one now you will save its cost many times over before you have had it a year.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit

78 CORTLANDT ST., N. Y.

Talks With the Trouble Man

For twenty-five years I have been in the working end of the telephone business. I have chased all kinds of troubles in all kinds of places. I have seen the development of the party line system with all of its new troubles and advantages to the telephone man. Many a time I have been sent out into the country to learn why a subscriber's bell did not ring and struggled in vain to locate the trouble, only to find that others on the line either had their receivers off the hook or took them down before the signal was finished. I have heard the operator grumble and the exchange manager swear, but never found any means of stopping the trouble made by "RUBBER-NECKS" until the development of the party line condenser.

These furnished the greatest comfort we had ever known and to-day there is no necessity for an exchange manager to worry about **receivers off the hook.** The day is not far distant when a party line telephone without a condenser will be as rare as the old "Blake Transmitter."

No Trick At All. **CONDENSERS**

Condensers can be installed on any telephone in **10 minutes' time with no tools but a screw-driver.** You simply disconnect the receiver cords and put the condenser cords in their place; then connect the receiver cords to the binding posts on the condenser and the job is done. Probably no piece of telephone apparatus has grown in favor with such rapidity as the Andrae Patented Iron Case Condensers. Telephone companies are adopting them all over the country, and letters are received daily with expressions of the greatest satisfaction and orders for more condensers. A 30 days' trial can be had **at our expense** with no strings to it.

REASONS WHY

YOU SHOULD INSTALL

THE CALCULAGRAPH

No. 10

(See "Reasons Why" No. 11 next week)

IT PAYS DIVIDENDS

If you lose a fraction of a minute charge on each toll message over your lines every day in the year, the sum total would be appalling. That's just what happens through pencil and clock timing. But the Calculagraph turns these lost seconds into dividends.

It Makes No Clerical Errors **Booklet Sent on Request**

CALCULAGRAPH CO.

1437 Jewelers Building **New York City**

Agents for Canada: Northern Electric and Manufacturing Co., Ltd., Montreal.

SQUEEZE IT; IT'S READY FOR SOLDERING

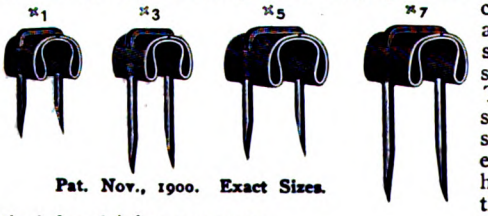
The Blake Tube Flux allows just the right quantity to be put on the desired spot, and by the use of one hand only.

Can be used on intricate switchboard work, because there is no danger of dropping it where not wanted and thus damaging some switchboard connection.

Order a trial tube; by mail, postpaid, 20c.

BLAKE INSULATED STAPLES

Can be driven over two or more wires without danger of causing a ground or cross. The fibre insulation never falls out in driving. And good driving qualities are assured because a standard square shouldered staple is used. This standard staple is the result of years of experience and has been found the most practical for driving purposes.



Pat. Nov., 1900. Exact Sizes.

Made in several sizes. Samples free.

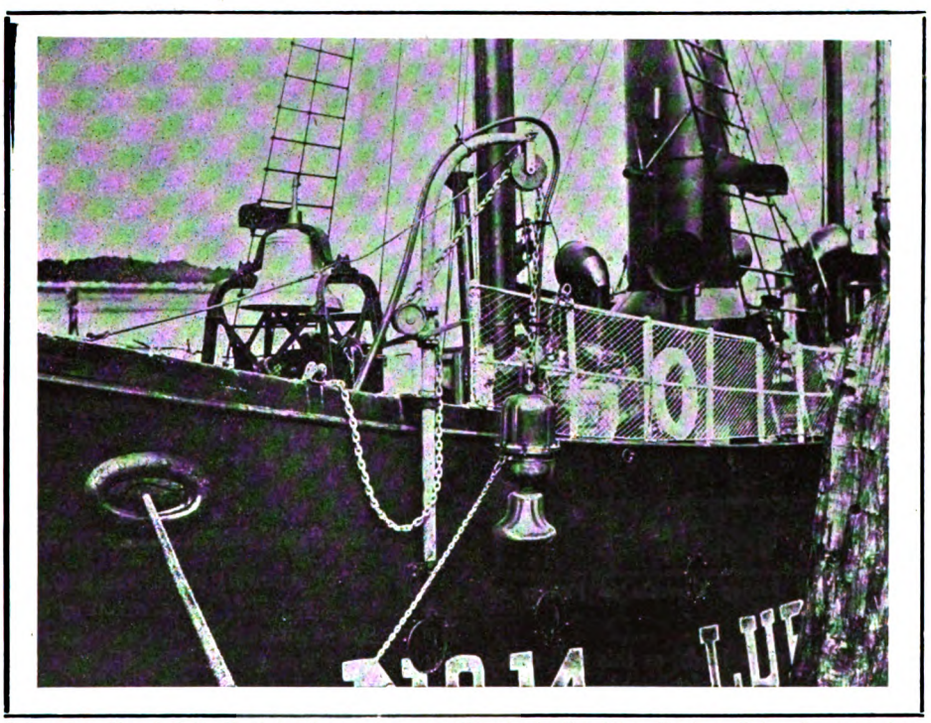
Advances in Ship Protection by Aid of Telephonic Devices

By F. C. Perkins.

THE unique system of submarine signalling employing a sunken bell and special types of telephone equipment which has been devised for use between ships at sea and between ships and shore, has come into very extended use since the appearance in The American Telephone Journal of the first article describing it. It will be recalled by those who became familiar with the system some time ago that a pneumatic bell transmitter, submerged in the water, is utilized, and a receiver box is placed in the pilot house of a vessel. The dangerous coasts may be avoided in a fog and it is now believed that the submarine telephone is destined to play as great a part in short range communication at sea as wireless telegraphy does for greater distances. Its greatest use is now, and will probably continue to be, to keep mariners off dangerous ledges when lights are invisible. In Boston Harbor and on Nantucket Shoals, Mass., and at Sandy Hook, as well as at Fire Island, N. Y., submarine signal bells are now used. The apparatus consists of a submerged bell of special design shown in the illustration, adapted to produce sounds in the water, and thus forming the signalling apparatus, while the receiving apparatus is located on the ship and picks up the sound of the bell and aids the pilot to determine its direction.



Submarine Signal Bell, Used in Connection with Telephonic Receiving Devices, Being Lowered from Side of Vessel.

Except where the new system of submarine signalling has been introduced the sending of sound signals through the air is the only way of safe guarding navigation in foggy weather. The limited range and extreme variability of transmission of sound through the air are due to differences in the density and temperature of the medium, to the interference of the wind, the smothering effect of snow, the drowning of signals by other noises, and the confusing effects of echoes, and other causes well known to mariners. These, together with the difficulty of locating sounds, even when they may be heard, stamp the ordinary air fog signal as a delusion and a snare. How often it proves so is attested by the appalling loss of life and property every year by shipwrecks, the majority of which are due to the navigators losing the course in a fog.

The superior reliability of submarine signals appeals to all, as the water is not only a better conductor of sound than air, but is also not subject to the same variable conditions. Sea water is of practically uniform density at all depths. The velocity of sound in water is more than four-fold its velocity in air, the distance traversed being about 1,100 feet per second in air and 4,700 feet in water. The range of signals in the water is correspondingly greater. Below the surface of the sea there is practically no noise to conflict with the note of the signal bell and abundant experience has proved that it can be heard and located as well during the most violent weather as on a calm day.

The submarine bell takes various forms, according to the different requirements of the service. In one of its applications it is hung in the air from a lightship and operated from the boat. Submarine bells of this class are used on the Red Island lightship in the St. Lawrence river, and also on the Elbe lightships at Hamburg, Germany, also on the North German Lloyd tender at Cherbourg, France, and on the Sandette lightship in the English channel. Another method of using it is to suspend the bell from a buoy, where it is rung automatically or through a connection by an electric cable to a lighthouse or other type of station on shore. For sending signals from a ship in motion, the bell or other sound-producing device is inside the hull of the vessel and is operated either by automatic machinery or by hand.

On the ships of the Cunard line as well as the French and White Star line, also on French, English, German and American government boats, the submarine signal receiving apparatus is installed. This apparatus comprises a pair of sensitive telephone

Comparative Costs of Methods of Supplying Power for Private Branch Exchange Switchboards

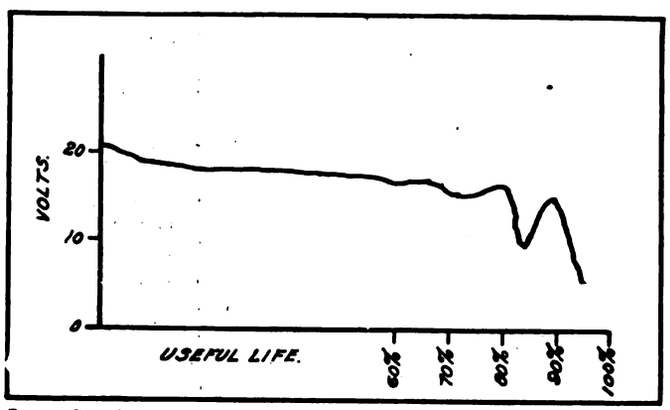
BY GEORGE A. SCOVILLE, SALES ENGINEER, THE DEAN ELECTRIC CO.

ALL large operating companies do extensive branch exchange work, and each company has, in most cases, worked out some system to supply power to such boards in a manner well suited to whatever conditions exist. On the other hand, when smaller companies launch into this class of work they are more or less at sea how to proceed in selecting the proper method of supplying power to their boards. The writer has frequently seen large branch boards and also isolated telephone exchanges operating from 50 to 200 lines (common battery) from ordinary types of dry cells. It is needless to add that in every instance the managers were dissatisfied with the cost and behavior of their power sources.

The following discussion will comparatively line up the conditions more generally found, and, by giving figures which the writer has derived from actual installations, may assist those who are going into this class of work to figure out their needs more exactly. All data will be based on the type of board with which the writer has most frequently to deal—a 20-volt, lamp signal, common battery branch exchange board with an assumed equipment of thirty lines, six cords, two trunks; load to be ten calls per line per day.

In choosing primary power for a branch exchange board, the different methods of supplying power and their adaptation to the available source of power must first be considered. The cost of each possible method should then be tabulated so as to show the cost at the end of the first year, the second year, etc.

On the board under discussion we will assume that direct and alternating current is available and that power can also be



Curve Showing Variation and Gradual Falling Decrease in Voltage of Primary Battery.

supplied from the main office over trunk leads, as this will make it possible to use any one of the following plans which are more generally applied:

(*a*) Some form of primary battery.

(*b*) Storage battery located at the branch exchange and charged from the direct current mains through resistance.

(*c*) Current supplied over trunks from the main telephone exchange battery.

(*d*) An isolated power plant.

Installing some type of primary cell will immediately suggest itself as the simplest method, but, on the other hand, it will prove to be the most unreliable. Careful life tests on all forms of primary batteries will show them to be not at all fitted for this class of work. It is necessary on common battery work to have a steady source of power and on primary cells the voltage will start out bravely, but will very soon fall to a certain value, remaining near this value the greater part of its life; then, as it approaches the end of its life, it will fluctuate so as to be unfit for further work. During the early part of the life of a primary cell no attendance is required, which is an important item, but when nearing the end of its life it is necessary to watch it closely and finally either renew parts or replace the cell entirely. The better grades of primary batteries of, say, 300 ampere hour capacity, with a sufficient number of cells to give 20 volts, will cost about $60. This price will include drayage and installation. Such a set should last about four months. It will be necessary to replace or renew about every four months. Whether renewed or replaced the cost will very nearly repeat itself, or will be at the end of the first year:

Initial cost	$60.00
Renewals	100.00
Labor renewals	7.00
Drayage	3.00
Maintenance	10.00
	$180.00

At the end of the second year there will be an additional expense as follows:

Three renewals	$150.00
Labor renewals	10.50
Drayage	4.50
Maintenance	10.00
	$175.00
Add to this the cost for the first year	180.00
And we have	$355.00

Or an increase of $175.00 each year.

The curve opposite is taken from a typical set of primary cells under actual load and indicates the behavior of the voltage at different stages of the life of the cell.

It will be interesting to note at this point some data taken by one of the large operating companies on a branch board equipped for 90 lines and 6 trunks—the load being less than ten calls per line per day.

Initial cost of primary batteries	$81.00
Three complete renewals	189.00
Labor renewals	30.00
Drayage	8.00
Cost of first year	$308.00

The cost of renewals alone was $227.00 and the primary battery was replaced after a year's run by a five ampere, thirty volt Holtzer-Cabot alternating current motor generator charging set, a five ampere storage battery and a home-made power board with switches, etc. This cost, installed, $220.00. The power bill was $4.15 per month, or $49.80 per year—paying for power at the rate of 7½ cents per kilo-watt hour. The maintenance was about the same as for primary cells and attendance but little more than for the primary cells. It is necessary to add that during the second year the equipment had increased to 118 lines and 14 trunks, and the load considerably over ten calls per line per day.

The plan of installing a charging panel and storage cells is very popular and can be easily adopted if direct current is available at a reasonable voltage. Frequently a building has its own lighting plant, thus assuring, in most cases, steady voltage. A simple charging panel to contain the necessary lamp resistances, sockets, switches and underload circuit breaker will cost in the neighborhood of $38. In choosing a battery it is best to take one that will run for long intervals, the additional cost on small batteries being too small to take into serious consideration. 11 small storage cells with a normal charging rate of 1½ amperes, with necessary wire, installed, will cost about $30. It will be necessary to charge such a battery about five hours twice a

Digitized by Google

week. The cost of a single charge, assuming a rate of eight cents per kilowatt hour, would be:

$$\frac{1\frac{1}{2} \times 110}{1000} \times .08 = 1.32 \text{ cents per hour.}$$

10×1.32 (cts.) $\times 52 = \$6.86$ per year for power.

Total cost will be:

Charging panel	$38.00
Battery	30.00
Operating	6.86
Maintenance	10.00
	$84.86

During each succeeding year the cost will vary from $16 to $25, the fluctuation depending on the amount of repairs and attendance. There is a waste in the charging panel, so that it gives an efficiency of only about 20 per cent. at 110 volts. The increase of the voltage will further diminish the efficiency.

The attendance cost per year will vary with the number of boards in operation in any district and often this item is reduced when the engineer of the building does the charging, only an inspection now and then being necessary. Again, the building will frequently furnish the charging current free. In small exchanges operating but a few of such boards the extra time is added to some workman's routine.

The third method, supplying battery over trunks from the main office, is accomplished in various ways, such as:

(1) To feed battery over one, two or three cable pairs to the board in question, with condensers bridged across the leads at the board to take care of noise, etc.

(2) To feed battery from the main office over cable pairs and use a small storage battery at the board.

(3) To feed battery from the main office through a storage set at the branch board and use the ground for return. These methods will be discussed in detail, with reference to the number.

In feeding battery from the main office for charging storage batteries at the branch board either the exchange battery or direct current at a higher voltage may be used, and in any event the condition best suited must be used. Wherever a cable pair is used that pair or pairs strung on a pole has a definite value, has a definite rental value and will also represent a certain loss in charging which is due to the resistance of the cable pair; also, wherever power is supplied from the main exchange battery the loss in the original machines and storage battery must be taken into consideration.

(1) To feed battery direct over cable pairs without a storage set at the branch board is only advisable where the branch board is located close to the main office and the equipment consists of but few lines, because as the load increases the drop in voltage due to the cable resistance will make the board inoperative, or will require more cable pairs, which is objectionable. This method is frequently used where the cable pairs are one side and the ground return on the other. This method frequently requires condensers bridged across the leads at the board to prevent disturbances.

(2) Again where the distance from the main office is not great, cable pairs are used to feed power from the main office battery to the branch board and charge the branch battery using the ground for return; that is, the branch battery is a floating battery and is connected in multiple with the main battery continually. This can be used where the feed leads contain but little resistance. This method is a favorite one with some companies.

(3) This method is very generally used, especially where the larger operating companies operate quite a number of branch exchanges, and is most generally accomplished by using 60 to 110 volts direct current and charging the branch exchange batteries from the main office at night. One of the large operating companies which operates about 230 branch exchange boards uses this method and charges each branch exchange battery all night for five nights during the week (in nearly all cases on boards of the size under discussion). C. T. cells are used and these are charged at the rate of one-half ampere. The loss in cables, the value of cable pairs themselves, etc., is more than balanced by the saving of labor that would be required to charge the isolated plants. In this case the company saves the labor of five men, who were paid $2.75 per day.

(*d*) Where the branch board is isolated and alternating current is available an isolated power plant may be installed as follows:

11 C. T. storage cells	$30.00
Simple power board with voltmeter, ammeter, circuit breaker and switches, etc	135.00
Motor generator charging set	75.00
Labor installing	25.00
	$265.00

The cost of power will about equal that shown for the charging panel; the maintenance and attendance will exceed somewhat that of the charging panel. The attendance cost must be approximated to suit the actual conditions in this case as well as the others.

The question of ringing power has not been mentioned as it will be taken care of in about the same way regardless of the way power is supplied. The favorite way is to furnish it over a cable wire and use ground for return. The alternative plan is to use a hand generator, or some form of pole changer.

In summing up the different conditions we will see that the primary battery should only be used for emergency or as a last resort. Again the alternating current motor generator set, owing to first cost and attention necessary, should be eliminated and the choice should be made from the remaining methods. When only a few boards are operated and direct current is available so that satisfactory arrangement can be made with the management of the building, the charging panel will be the most satisfactory. As the number of boards increases, so as to bring into consideration the cost of labor to take care of charging them some of the methods of furnishing battery over trunks must be used. By tabulating the costs of the different methods and considering the features of each it will be a simple matter to decide which is the method to adopt.

OFFICIAL BULLETIN NUMBER NINE OF THE INTERNATIONAL TELEPHONE ASSOCIATION OF AMERICA.

CONVENTION.—The convention will be held at the Auditorium Hotel in Chicago June 4, 5 and 6. The committees will meet on June 3. Full details will be given out later.

PROGRAM.—The convention program is being prepared. Officers of affiliated associations are requested to send in names of speakers and candidates for the various committees, so that every section of the country may be properly represented on the program.

Suggestions regarding topics to be discussed are also invited from all interested. If you think any subject should be given attention, we want to hear from you at once.

INTERNATIONAL CONVENTION DELEGATES.—Associations should select their delegates and alternates as early as possible, making prompt report to the office of the association so that proper credentials may be issued. Don't put this off until the last moment.

REPORTS FOR THE CONVENTION.—Officers of the various associations are reminded that under the present constitution the order of business provides for *written reports* from associations, in response to the roll call. Active work to bring the statistical information for such reports up to date should begin immediately. *This matter is of vital importance. Don't neglect it.*

SPECIAL NOTICE TO STATE ASSOCIATIONS.—The attention of officers of State associations is directed to the stand taken by the International Association at the last convention, regarding Bell-owned equipment manufacturing companies, and to the importance of *not permitting such companies* to exhibit at conventions.

STATISTICAL WORK.—The map department has made exception-

Digitized by Google

ally good progress during the past few weeks, due to a more ready response on the part of local companies to requests for map data. We appreciate this, and trust it will continue, in order that a good exhibit of maps can be made at the convention. Remember, you are serving your own interests by making it possible to include your company's lines in our State maps; so if you operate toll lines, send us a sketch of them without delay. Don't make it necessary to write you four or five times for this.

We have had occasion recently, to request considerable information of a statistical nature, from various companies, and wish to extend our thanks for the alacrity with which our letters, with scarcely an exception, have been answered. It will be necessary to secure further data of this kind, and we hope for a continuance of this prompt attention to our requests. It saves time and lessens the expense of the work. In this connection, local companies would do well to refuse to furnish information regarding their plants to any persons not known to be thoroughly in sympathy with the Independent movement.

The Telephone Kicker

BY MISS T. BARNES.

To the misusers and abusers of the telephone this article is dedicated.

WHEN the telephone was in its infancy the instrument was regarded as a plaything for the family, for relatives, and for neighbors. It was thought of much as the phonograph is in the rural homes to-day, but for the last century the spirit of progression has so thoroughly saturated our minds that nothing remains very long a novelty to us. As each new invention becomes known it immediately becomes one of the necessities of life, or in a very short time passes down into history as a failure. But we are never satisfied. Very few people could replace the idea with a better one, but nevertheless it comes under the ban of criticism.

We are becoming the masters of electricity, this wonderful force, more and more every year, causing it to run our factories, street cars, carry our messages, and perform innumerable other kinds of useful work, yet when a stronger force, the elements, wages war and spreads devastation for a time, there is a fuming and fretting and often profanity hurled at anyone who looks as if he might be connected with the thing in trouble.

The telephone is regarded as a cuspidor for the wrath and profanity of the "kicker." He spits into the telephone things that he would not think of saying if he were in the presence of the party at the other end of the wire. He is a coward. The fact that he has walls and blocks of pavement between him and the other person tends to make him more vindictive. If he should be brought unexpectedly face to face with the person whom he abuses, and be given a chance to speak, he would tremblingly offer an apology and then take it out on the telephone girl for the next week because he knows she does not dare talk back; but he fires away at the transmitter while the office boy or dog slinks out into a quiet corridor until he has expended his wrath, as self-preservation is the first law of nature.

The telephone, like a magnet, seems to draw out all the littleness in human nature.

The man who demands that his telephone be repaired before anyone else's telephone is looked to is the one who keeps other people waiting longest for any reparation he should make for his acts. The man who demands the quickest service, in an unreasonable manner, is the one in whose place of business you usually make the longest waits, either through inefficiency of service or otherwise. But if you should stand there fuming and fretting, and become abusive to his help, you would be shown the door. If this happened during a rush spell the customers would say "How unreasonable he is. He can see how busy they are."

The man who asks to borrow your residence telephone at night a few minutes to talk over a little private business is the one who asks your family to step out into the hall or anywhere else out of hearing, no matter how it inconveniences them, as his conversation is of a private nature. He then proceeds to abuse everyone from the operator to the manager because the name of the party he is calling for is not in the directory, as it was installed after the directories were published. When he finally hangs up and departs you feel as if a small-sized cyclone had broken loose and you look around to see if your family is all right, then lift the receiver off the hook and apologize to the operator.

The man who demands angrily that his residence line be released, "as his family has held it too long already," is the one who in his home is a jealous and selfish monster.

The man who claims he never gets good service is the one who is disappointed when he does.

The man who doubts that a line is busy when he calls for it does not think it can be busy unless he is using it; when the connection is completed for him, he demands to know if it *was* busy previous to his call. He takes up the owner's time with a long preamble about how many times he called, etc., and how he will give his orders to other houses. He then turns in a small order and grumblingly hangs up the receiver. In the meantime the firm has probably lost one or two better orders by his holding the line so long.

The man who has time and inclination to "jolly" the operator is the one who in his home has neither time nor "jolly" for his family.

For the unreasonable woman, the writer will say that she would rather take fifty reports of trouble from angry men than one report from an unreasonable woman. After she has hung up the receiver little phrases of her conversation keep humming through the operator's brain like dozens of tormenting little mosquitoes with their shrill tones, singing threats of their painful bites into her ears. The woman who holds the line the longest is the one who wants independent line service with party line rates.

The woman who does not believe that her telephone is repaired, because the trouble man did not come to the house, is the one who has a long lecture ready and hates to think that she has no one to listen to it.

The woman who claims that she never gets good service is the one who is never at home when the collector calls.

The woman who complains to the manager when a second party is put in on her line while she is talking never has a word to say if she is put in on a neighbor's busy line, at least not until they are through talking.

Is it not possible that there would be fewer mismated people in the world, if we all could see each other from the telephone operator's point of view?

ADVANCES IN SHIP PROTECTION BY THE AID OF TELEPHONIC DEVICES.

(*Continued from page* 185.)

transmitters placed inside the ship against the outer plating or planking and below the water-line, one transmitter being placed on the port side and the other on the starboard side of the vessel. Wires connect these transmitters to a single telephone receiver box in the pilot house, a switch at this point enabling the pilot to listen to the sound as it is received either on the port or the starboard side, and by a simple manipulation the bearing of the signal bell can be accurately located.

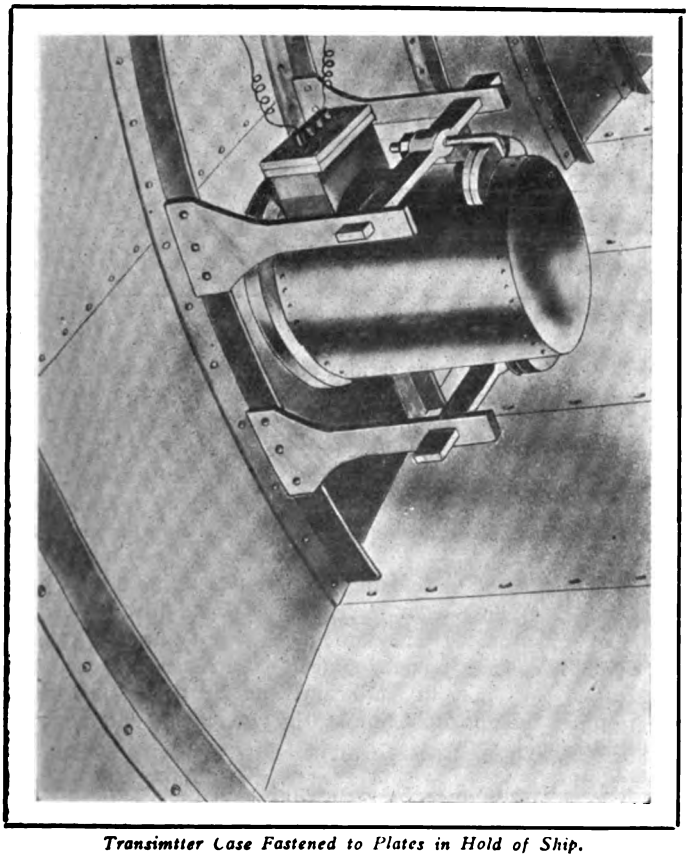
The mechanism for hearing these signal bells in the pilot

Digitized by Google

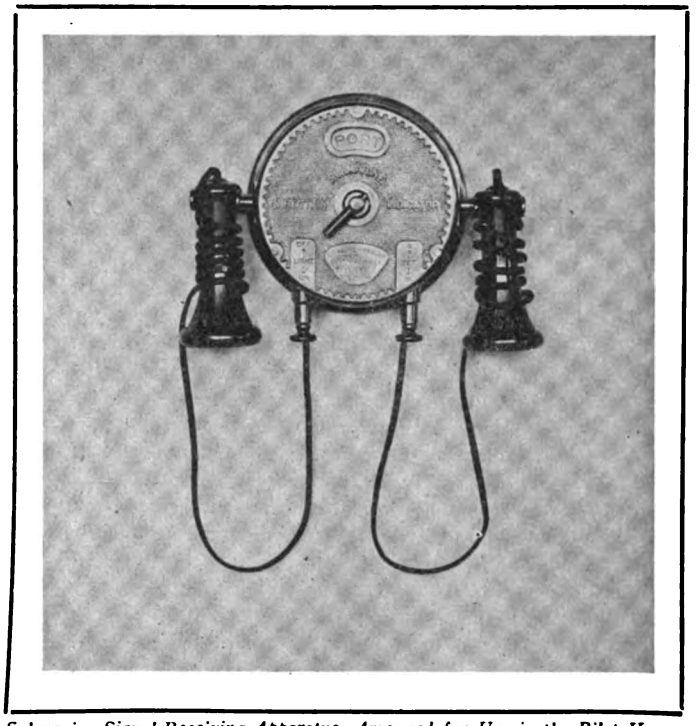
house of a ship looks like an ordinary telephone at first glance. However, instead of making use of but one receiver, two are utilized in case one should break down for any reason. By taking down the receiver when nearing a dangerous reef where a lightship is anchored, the captain of the ship can tell from which side the sound comes by merely moving the lever to one side and then to the other. Sound travels in water in only a straight line, and if it is reflected it is so weakened that it can be readily distinguished from the noise coming from an object in a straight line. A captain can guide a ship from the sound of a submarine bell when the ship is in a dangerous course, the captain hearing the bell louder through the transmitter when the lever is turned to the side toward the bell. He then changes the ship's course in that direction until the bell sounds alike which ever side the lever is turned to. Then, knowing the direction of the bell, he easily avoids the danger. The position of the bell can be determined in this way within half a point, and as the mariner's compass is divided into 32 points it can be seen how accurately the bell can be located. In a report made to the Secretary of the Navy, Lieutenant Commander Walling stated that he could hear the bell from 5 to 12 miles and locate it within ⅛ of a point.

Owing to the magnetism of the telephone receiver it is necessary to keep the telephone apparatus away from the compass, and in some cases a flexible speaking tube runs from the telephone to the front of the pilot house. Wires are led through pipes down to the tanks on either side of the ship which contain microphones surrounded by water. A sound coming from the water outside passes through the ship's side and into the water in this iron tank, no hole being made through the ship's hull. The sound waves strike the transmitter diaphragms and are transmitted as in the ordinary telephone.

The Navy Department at Washington proposes to use this method for communicating with submarine boats and the Submarine Signal Company, of Boston, has designed a special apparatus for sending messages, called a multiple sounder. One instrument has an alphabetical keyboard similar to a typewriter. Pressing a key causes a set of hammers to beat on a diaphragm, the Morse telegraphic signal being used for each letter. A special apparatus like a stock ticker enables the message to be picked up on a submarine boat or received at a short station or on the flagship of a fleet. A still simpler way of transmitting messages is by attaching a striking gong to the side of the ship and tapping out a certain code, the tapper being worked by hand, steam or electricity. A message of this kind can be picked up at distances up to twelve miles by parties knowing the code. The Navy Department has a secret code.



Transimtter Case Fastened to Plates in Hold of Ship.



Submarine Signal Receiving Apparatus, Arranged for Use in the Pilot House of a Vessel.

Newport was the scene of the first experiments with this apparatus, the yacht Chipeta being equipped with the apparatus and sending messages to the two submarines Porpoise and Shark, while under water. Although these two boats had no means of replying save the crude method of striking a hammer against the steel sides of the boat, their signals were readily picked up by the Chipeta.

Since it is feared that during action wireless telegraphy will be unreliable owing to the concussion of the big guns throwing the delicate coherers out of order, the United States naval authorities have looked to this new method with interest. Experiments were conducted on a government tug at Newport with a view to the introduction of this system as a regular part of the submarine boat service.

Submarine bells are now installed at the lighthouse at White Island Reef, Red Island, Anticosti, Lurcher Shoals, Boston, Pollock Rip Shoals, Vineyard Sound, Breton's Reef, Cornfield Point, Nantucket Shoals, Fire Island, Sandy Hook and Overfalls. These bells are struck in all thick weather. An order was given by the Secretary of the Navy for the installation of a number of these machines on warships and submarine boats. The Atlantic, which won the German Emperor's cup, was equipped with this apparatus and if all the other vessels had been equipped in the same manner there would have been no necessity for postponing the race, owing to the heavy fog.

Major H. L. Higginsson, who is greatly interested in submarine signalling, states that "It is outrageous for steamers like the Cunarder Caronia to run ashore. To jeopardize lives and imperil valuable cargoes is a crime when the present age on invention offers apparatus to safeguard them. If the Caronia had been equipped with a submarine telephone it would never have run ashore, for the night before the Caronia sailed the Deutschland, equipped with the submarine telephone, put out to sea under similar weather conditions without mishap, and the Sandy Hook signal could be heard 8 miles away. It is as necessary to safeguard the voyage of a sea craft as it is to insure

Digitized by Google

property or lives on land. Where the means are offered to insure safety on the seas, no time should be lost in adopting inventions with that end in view." Many lives may be saved each year by this newest adjunct to the government coast service.

In addition to its use as a means of preventing shipwreck, its possibilities for use in naval affairs have caused not only the United States Navy to adopt it, but to some extent the navies of England, Germany and Holland. It affords the only possible means to communicate with submarine boats under water. Wireless telegraphy cannot do this. Moreover, atmospheric conditions often render wireless telegraphy unreliable and during fogs or thick weather the present wig-wag system of signal flags is worthless. By the submarine telephone, however, the admiral of a fleet can send messages to all the vessels in his squadron and know the location of every one by simply holding a telephonic receiver to his ear. The commander of a warship can hear the approach of a torpedo boat or battleship under the cover of the fog or darkness and, being able to tell the direction in which it is approaching as well as its approximate speed, prepare to receive it.

Rural Party Line Ringing Codes*

THE next thing considered was proposed by our Bell friends, who assured us that it was in use all over the country on "farmer lines" and was the best that could be devised, as it was hatched "in Boston." 'Twas the one shown in Table 5. This code is simple, easily understood, requires only a reasonable number of rings (but enough to rack their generators in a short time), most of which are uniform in length, but is wasteful of time, as a space is used in almost every call, and, as it is not within the range of possibilities to teach the subscribers to all use even an approximately correct "space" when calling one another, it was declined with thanks.

After the experience outlined we decided that a code for our work should have the following characteristics:

1. SIMPLICITY, so as to be easily comprehended.
2. BREVITY, as time used in signalling cuts down traffic, (also income).
3. SYSTEM, as there are already too many "hodge-podge" haphazard "codes."

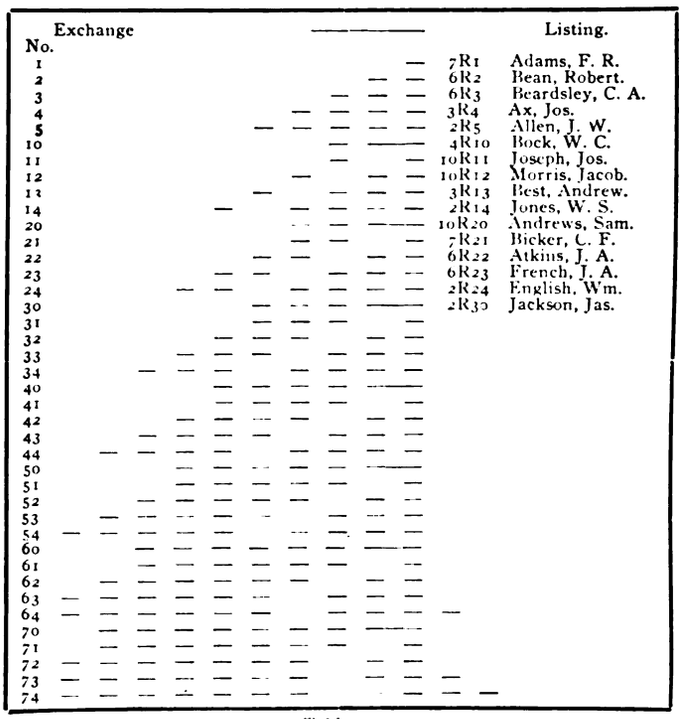


Table 5.

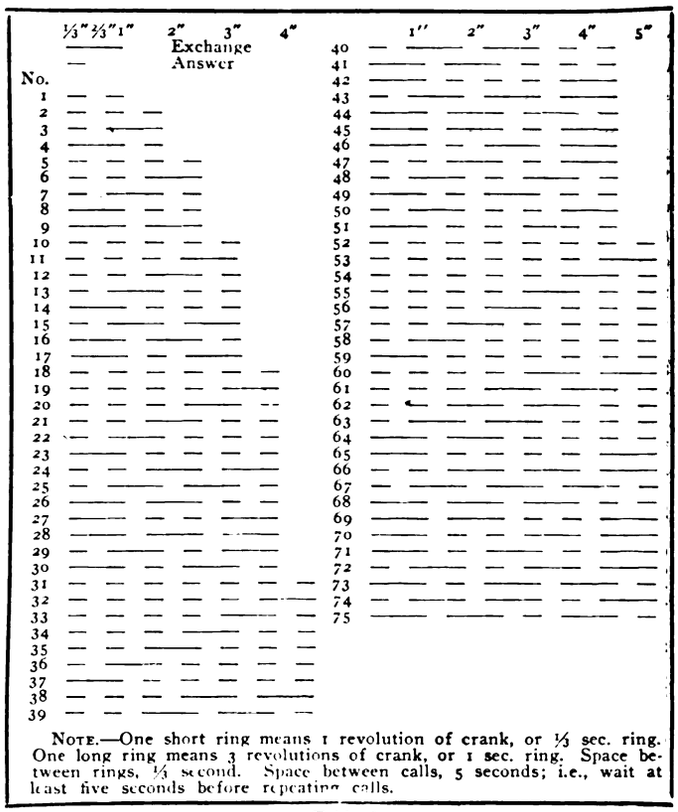
4. EXPANSIBILITY, we are growing.
5. DISTINCT SIGNALS, so that parties not called will not have to follow ring to completion before knowing that someone else is wanted.
6. ABSENCE OF "SPACED" CALLS.
7. ABSENCE OF LONG SERIES OF SIMILAR RINGS } To avoid
8. CALL UNITS OF NOT MORE THAN TWO LENGTHS. } confusion
9. SHORTEST CALLS FIRST ON LINE. To keep down ringing load.

*Continued from the issue of March 16.

The code devised and adopted as best meeting the conditions imposed we will call code F, and it is shown in Table 6.

We think that we have overcome the faults generally complained of in "codes," as the above meets specifications fairly well, as it complies exactly with specifications Nos. 2, 3, 4, 6, 8 and 9, and as nearly as may be with Nos. 1, 5 and 7. There may be some serious objections to this code; if so, we would like to hear what they may be.



NOTE.—One short ring means 1 revolution of crank, or ⅓ sec. ring. One long ring means 3 revolutions of crank, or 1 sec. ring. Space between rings, ⅓ second. Space between calls, 5 seconds; i.e., wait at least five seconds before repeating calls.

Table 6.

We believe that the lack of standards in ringing has caused more trouble and killed more codes than has anything else, and respectfully submit to the fraternity those mentioned in Code F with the hope that they will benefit others as much as they have us—we think they will be found practically correct.

It may be noted in closing that we have made all our codes rather extensive, as we carry a normal load of forty-two telephones on a twenty-mile line, two exchanges (equal to eight telephones) and sixteen telephones (sometimes twenty-two) on a seventy-mile line, and ten telephones on a twenty-mile "composite" line with two intermediate telegraph stations.

EDITOR'S NOTE.—The writer of the interesting contribution here concluded signs himself Se HuntLeigh Pschmythe, and hails from Pennsylvania. Ideas of other men will follow.

QUERIES

PROTECTION FOR POWER WIRES.—(834.)

Will you please let me know if it is sufficient protection for our charging machines which are run from current supplied to the motor from the mains of the electric light company to put in a fuse at the point where the wires enter the building, the same as is done for the lighting circuit of the exchange? We do not want to spend any money for extra protective devices if it is not necessary, but on the other hand, do not want to run any risk of burning up our machines. Your advice will be very much appreciated.

C. P. F.

When the wires from the electric light company come to your exchange wholly underground, it ought to be sufficient protection to fuse them. Then, if there should occur any condition in the machine or the inside wiring which would cause a dangerous current to pass, with its consequent heating effect, the fuse would blow and thus protect the inside wiring and apparatus. As in most cases, however, the power wires are led to the telephone company's building on poles some provision should be made for protection against extra heavy currents and lightning, which are liable to be communicated to the wires at any time. It is usually the custom to insert some kind of a spark gap lighting arrester, with a magnetic blowout device, for complete protection of the circuit in order that the apparatus and wiring may be safely secured against damage from the several possible causes.

NUMBERING INSULATOR PINS WITH RELATION TO THE CENTRAL OFFICE.—(835.)

Please give me the correct way to number the wires on cross arms from the central office. Suppose, for example, that I have lines laid out with cross arms arranged as shown in the enclosed diagram, how would I number the pins?

E. B. R., Neb.

There are several common ways of numbering the wires in such a case as you describe, all of them perhaps equally good. The method which is probably most frequently employed is to number each group of wires, North and South, independently from 1 up. They will then come into the office as Nos. 1 and 2 South, Nos. 5 and 6 North, and so on. In connection with this arrangement a chart should be kept, showing the number and location of every pole and the pins taken by the various wires on each pole, for reference.

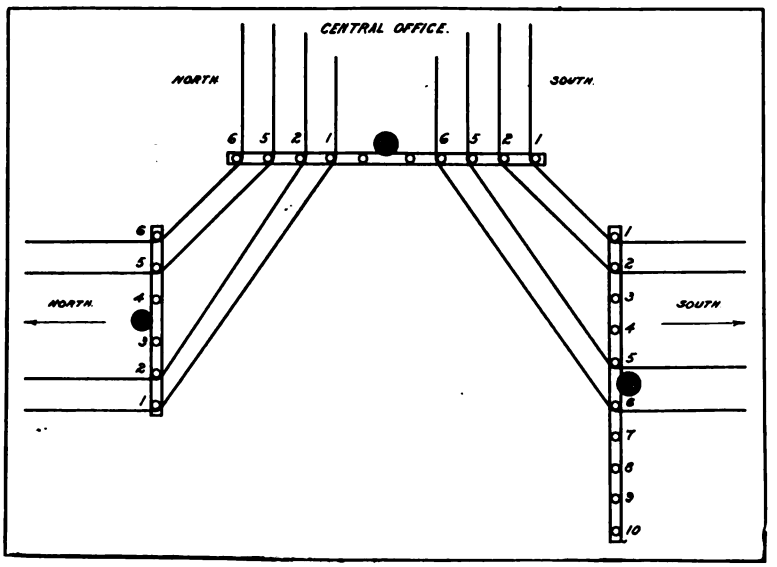

Fig 835.

TELEPHONE LINES ON TELEGRAPH POLES.—(836.)

Will you please advise me if it is practical to put telephone wires on telegraph poles and give good service? One of the leading telegraph companies has a trunk line consisting of two cross arms, six pins each on 35-foot poles running through our section, and it occurred that we may be able to arrange to put a ten pin cross arm about five feet below their cross arms and reach several more towns with toll lines. At the same time we would like to give the telegraph company the privilege of installing a telegraph station in each of these towns where it has no station and where the town is too small to keep an operator for the telegraph work. We would then be able to give the telegraph company a private circuit to the nearest operator, who could receive and deliver telegrams by telephone pay station installed in same store which is in our town. We expected to give them a grounded circuit, using both sides of our metallic circuit as one telegraph line. We do not have electric traction lines to bother with. What do you think of our scheme and can you suggest anything better?

M. W. B.

The use of a telegraph pole line for telephone circuits as you propose is entirely feasible. With a separation of five feet between cross-arms there should be no disturbance in the telephone circuits from the telegraph company's wires, provided the latter company uses only the standard Morse apparatus, duplex or multiplex.

If the telegraph company makes use of any duplex or quadruplex circuit which involves alternating or pulsating currents of high frequency, such proximity will be fatal to telephone service. You can not get too far away from them under these circumstances. It is very desirable to have an agreement before occupying its poles, that the telegraph company will not use such a circuit. The "Phantoplex" used by the Postal Company is an example of the sort to be avoided.

While we notice that in the sketch you have sent you use the type of phantom which is made up with retardation coils, we believe that a more satisfactory form of simplex circuit than the one with the retardation coil is the repeating coil circuit. It has the advantage of electrically isolating that part of the telephone circuit used for the phantom telegraph from other portions of the line, and from the switchboard apparatus. It is, moreover, absolutely a necessity if the telephone operators are to ring on the line with grounded generators.

A good repeating coil with four windings of a proper resistance, and with a continuous soft iron core, which may be made of wire or laminated, may be used. Care should be used not to introduce a number of these coils into a telephone circuit on which it is necessary to ring through for any great distance. The repeating is not very efficient in the transmission of ringing current of low frequency, though, in its best form, it offers little resistance to the passage of high frequency voice currents.

THE CONSTANT READER'S QUERY.—(837.)

March 20, 1907.

Editor AMERICAN TELEPHONE JOURNAL, New York.

Dear Sir—In your issue of March 16, in the Query Column, I notice description of circuit for "Picking Out Pairs in Cable Carrying Battery." Would you be kind enough to publish diagram of similar circuit and explanation of the Bell company's test box equipped with induction coil, condenser relay buzzer, three batteries and switch, which they use for similar work, and oblige,

Very truly yours, CONSTANT READER.

Now, if any man knows just what this chap wants, if he will enlighten the Editor he will be doing us a favor. The "Bell company"! There are hundreds of Bell companies, when we get down to testing out cable pairs, and perhaps there are twenty different sets. And then, this query looks as if the man knew all about the thing himself! Signs himself "Constant Reader," too. Doesn't want to know badly enough to give his name and address, so that we can write him a letter if the answer to his question can not be published. The worst of it is that this letter is not a rare bird—it's one of a class. This is the first response to a query signed only "Constant Reader" which we have published, and it's likely to be the final one.

THE EDITOR'S PAGE

THE WIRE CHIEF AND HIS TERRITORY.

THE success of a wire chief is not always due to the perfection of his knowledge of the theory of the instruments he uses in the performance of his work. It is fully as likely to be a result of an intimate acquaintance with the things encountered by his assistants in the course of their work on the plant. The prime duty of the wire chief is not to take readings of measuring instruments, but rather to interpret such readings as are obtained, and which in comparison with the entire sum of his work rank as mere incidents. The skilful translation of the readings depends fully as much upon a close and real knowledge of the entire territory under his care as upon an acquaintance with the nature of the operations which may be performed at his desk.

It is true that the man who has a good record for accuracy is likely to be known as a wizard with the galvanometer and bridge. The least informed members of his subordinate staff look upon his performances with astonishment, because his work is done by the aid of tools with which they are not familiar. When they see the keys manipulated and the needle swing across the scale, their minds are pinned to the needle itself, and not to the ground or cross a mile or two away. No wonder that it looks mysterious.

It is because of his ability to have his mind directed to both ends of the wire at the same time that the wire chief holds his job. He finds it necessary to be well informed not only as to the nature of the troubles which afflict a telephone system, but their causes as well. The average trouble hunter is likely to lean pretty heavily on the man inside at the test set. He doesn't realize his advantage in being on the ground with his eyes ready to pick out the cause of the difficulty. He is more than likely to want to be led right up to the trouble. He doesn't want to find it, but rather to have it shown to him. Then, of course he will clear it, but in such a case he is not a real trouble hunter. He puts limitations on his own job. Still the wire chief who knows his business accepts these limitations and reckons on them. He gets results by the aid of an imagination well trained by practical experience. The kind of experience that is best calculated to give this training is an important thing for him to consider.

In the first place he ought to know the lines he is called upon to measure. It is not so easy to tell whether a trouble is in the house drop or the inside wiring, but there are men who can strike it right a great deal more often than they go wrong. The thing that helps most to do this is a genuine familiarity with the plant. It is often difficult to get outside and look the whole town over, and become familiar with the entire scheme of distribution, not only by plan, but by actual appearance. It takes time, but this time is well spent. It helps a man to think quickly, and think straight when there comes a rush of trouble. If he has the whole seat of the difficulty in his mind's eye he can do more than point out the trouble. He can direct repairs in detail, and give the benefit of the superior knowledge of construction methods which he should have in a most effective way at the times when it is most needed. This helps, for one thing, to do away with repeaters, those troubles which come up time after time in about the same way, and in about the same places; until they are bugbears of every maintenance department.

The inspection method is not the only one that is open to the wire chief who wants to know his job. He can make a study of the blue prints and plans used by the construction department and then talk things over with the trouble men for a few minutes at the close of each day's work. When this is done regularly, and carried out regularly in the right spirit on all sides, it is a very useful means of promoting efficient work. For one thing, it helps the men to know what are the most important branches of their work. As each man learns from all the others, the spirit of co-operation which can be built up, without any visible effort, is a great help to the production of definite results in keeping the plant in good shape.

The trouble records themselves furnish a supply of information which is almost invaluable. In large organizations groups of these records are analyzed very carefully by experts. This sort of work shows up clearly, by force of the unavoidable law of averages, the weak places in a company's plant. The wire chief can thus learn where a trouble of any given class is most likely to be found and often save time by having this part of the equipment examined first. Studies of this sort although difficult and puzzling at the start soon come to have an absorbing interest to those whose appreciation of their possibilities grows in proportion to the efforts they make. It is this kind of work which leads the wire chief beyond the immediate interest of testing into the larger fields of maintenance work, and by enabling him to approach the problems and consider results from a broader point of view, helps him to fit himself for more rapid advancement to the positions of greater responsibility.

ENGINEERING AND TRADING.

THE article on the cost of supplying current for the operation of branch exchanges, which appears in another part of this paper, serves incidentally to attract attention to the very close relation which the work of the modern telephone engineer bears to the practical problems of management. A few years ago it was thought that the young man with a technical training who went to work for a telephone company should be set to tinkering with batteries and generators, and might eventually be allowed to draw a few circuits or plans. Still, his field was pretty much restricted to the carrying out in detail of the broad schemes laid down by the general management, which were very frequently fixed upon after only a brief consultation with the engineering department.

At the present time conditions seem to be swinging just as far in the other direction. "Full information" is the cry of the manager, and the engineer is one of the men who is most likely to give the facts which determine the line of policy in handling a given branch of the business. In the first place he has to canvass all the plans for accomplishing the results which have been proposed. From them are eliminated at once those which would be inefficient from a service standpoint. The remaining projects are worked out carefully in detail and a statement prepared showing costs. The more expensive the work to be undertaken, the more elaborate become these studies, so that they frequently cover in detail several variations from a single general idea. The expense of making these studies is not small, but in the long run they pay by enabling the management to keep away from wasteful methods.

This is one of the reasons why it pays a company to have as good an engineer as can be obtained. Determination of costs depends so much on thorough experience with different classes of material, and labor under varying conditions, that to have information of this sort available is one of the most essential preliminaries to the fixing of prices and making of profits.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

LIABILITY CAUSED BY CONDUCTION OF STREET RAILWAY CURRENTS TO TELEPHONE LINE.

A street railway company and ourselves are occupying a street in this city (in Michigan) at the same time, and we find ourselves greatly annoyed by conduction or "leakage" from the railway company's plant. We were first in the street, and think that, for that reason, the railway company should be obliged to remedy the difficulty. We were not only here first, but had been using the street for six or seven years before the railway company was thought of. The company says that we ought to adopt a metallic circuit line. We think it is up to them. Please give your opinion on the subject. B. J. N.

IN cases of this kind the question does not depend so much upon prior use of the street as it does on the question of which company would be put to the greatest expense. In a case where the telephone company could install a metallic circuit by the adoption of a sufficient and comparatively inexpensive device, and the railway company could do so only at great expense and annoyance, the court refused to interfere in the interest of the telephone company.

The court based its decision for the railway company on the ground that the railway company was acting in accordance with the franchise granted by the State, that no negligence on its part had been shown, and that the damage to the telephone company was not a direct consequence of the construction of the defendants' roads, but were incidental damages resulting from their operation. Cumberland Telephone Company vs. United Electric R. Co., 412 F. 273.

STOCKHOLDERS MAY HAVE TO PAY DIFFERENCE ON STOCK BOUGHT BELOW PAR.

EDWARD M. COLLIE and Charles M. Myers, receivers of the Telephone, Telegraph and Cable Company of America, instituted suits in the District Supreme Court, at Washington, D. C., against A. L. Barbour for $12,500, and against Ann Augusta Thomas, widow of Samuel Thomas, for $25,000. In the declarations it is stated that this corporation, which was organized under the laws of New Jersey, had a capital stock of $9,000,000, made up of 600,000 shares of the par value of $15 per share. It is charged that Barbour purchased 2,500 shares of the capital stock, for which he paid $10 per share, and suit is now brought by the receivers to recover the sum of $12,500, being the difference between the amount actually paid and the par value of the stock purchased by him.

In the suit against Mrs. Thomas it is charged that she purchased 5,000 shares of this stock, par value of $75,000, for which she actually paid $50,000.

FORCING PAY STATIONS ON SUBSCRIBERS.

LOUISVILLE, Ky., is now face to face with the Bell Telephone Company in litigation growing out of an attempt by the city to curb this monopoly. The Bell company has brought suit in the Chancery Court to enjoin the city from collecting a license fee on telephone pay stations, which the company has been installing throughout the city, contrary to the wishes of the subscribers and users.

To make subscribers pay an extra fee when they telephone from any other telephone than their own, and to force druggists and some other retail business concerns to levy a tribute upon their customers, for the sole benefit of the telephone company itself, the Bell exchange has installed these pay stations in such stores, to the number of nearly 1,000. The company has refused to put in straight lines, even when merchants were willing to pay the full rate for unlimited service, permitting their customers to make telephone calls without charging a fee for this ordinary business courtesy.

The Bell monopoly, following its usual custom, paid no attention to the complaints of either the subscribers, who were denied the right to call up even their own home telephone, without putting a dime in the slot of the pay station, or the merchant who was willing to pay full rates for unlimited service, and the city authorities were finally appealed to for relief from this form of petty extortion.

It was found that the forcing of the slot machine pay stations upon subscribers was clearly outside of the rights granted by the franchise under which the company was operating, and the city authorities classed their installation as an outside matter subject to a license fee, the same as other legitimate slot machines in use.

The telephone company refused to pay the license fees and applied for an injunction restraining the city from collecting the fees or interfering in any way with the operation of the slot machines.

MUNICIPAL FRANCHISE HELD TO BE NECESSARY IN MINNESOTA BY FEDERAL COURT.

THE Northwestern Exchange Telephone Company must get permission from the city council of St. Charles, Minn., before it can establish a local exchange in that city. This is the decision rendered by Judge William Lochren of the United States Court at Minneapolis.

An action was brought in the federal court by the telephone company which asked for an order restraining the city council of St. Charles from interfering with the company while it put up poles and strung wires in that city. Judge Lochren in his order says that telephone companies have no right to place their poles or wires in the streets or alleys of any cities unless authorized by the council to do so. April 19, 1893, the legislature delegated to the cities and villages of the state the sole power of determining whether telephone companies might set poles and string wires in their streets and alleys. Since that date no telephone company has the right to occupy streets and alleys with poles and wires which had not been placed thereon prior to that date, without the consent of the city or village council. The fact that the company is engaged in delivering messages between the different states of the Union and is engaged in interstate commerce does not give it any greater rights in the streets of a city or village than it would have if it only did a local business. In either case the consent of the council is a condition precedent to its right to occupy the streets.

The Northwestern Telephone Exchange Company placed none of its poles or wires upon the streets of St. Charles until October, 1896, when it obtained from the council a franchise to extend its long-distance line through the city. The city does not question the company's right to maintain this line under the franchise granted by the council in 1896, but it has refused to permit the company to build other lines or occupy other streets in the city, and has passed an ordinance under which any employee of the company who may set any pole or string any wires not already placed, may be arrested, fined, and imprisoned.

IN THE OPERATING FIELD

FEATURES OF NEXT WEEK'S OHIO CONVENTION WHICH WILL DRAW A LARGE ATTENDANCE.

THE Ohio Independent Telephone Association convention which will be held in Columbus Thursday of next week (March 28) will be a one-day convention this year. It will be a "busy" day and the "busy buzz" will be in constant operation from early morning, when Governor Asa L. Harris of Ohio takes down the receiver at the Hartman Hotel at 10 o'clock a. m., until the last "Hello" is called in the banquet room.

Governor Harris will deliver the address of welcome on behalf of the State of Ohio, and Hon. D. C. Badger, mayor of the city of Columbus, will welcome the delegates on behalf of the city. A response will be made by President Beam.

Features of the session will be addresses by President James B. Hoge, of the International Independent Telephone Association, by Attorney Clarence Brown of Toledo, and addresses from fraternal delegates from other states.

The toasts at the banquet will be responded to by some of the best known telephone men in the country. Last year's convention was one of the best in the history of the association. It is calculated to make the coming convention overshadow that.

NEW BRANCH EXCHANGE BUILDINGS OF THE HOME TELEPHONE COMPANY OF DETROIT.

THE illustration on this page shows the type of the three branch exchange telephone buildings which the Home Telephone Company of Detroit, Mich., is building in different parts of the city. The buildings were designed and the work of construction is being superintended by Messrs. Stratton & Baldwin, architects, with offices in the Union Trust Building.

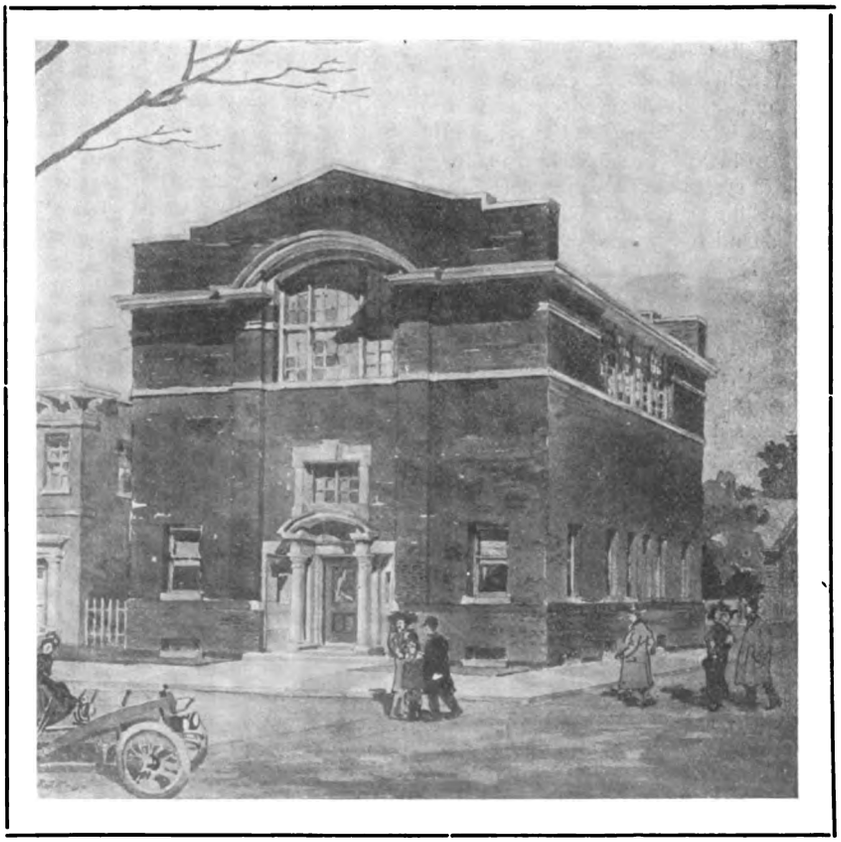
The East exchange is under process of construction at the corner of Sylvester and Field, and that exchange will serve the Eastern part of the city. Dalray and the Western part of the city will be served by the West exchange, which is under construction at the corner of Lafayette and Dragoon streets. The North Woodward district will be taken care of by the North exchange, which is being built at the corner of John R. and Bethune streets. These buildings are all about two-thirds completed and the construction is progressing at a very satisfactory rate.

The exterior is designed to conform with the Central exchange telephone building at the north-west corner of John R. and Madison streets, the material used being cut stone, terra cotta and dark red brick. The interiors of the buildings will be in all respects as complete and satisfactory as the central exchange. Each building will be fireproof throughout. A large and commodious basement will contain heating appliances and be used for general storage of telephone supplies.

The first story will contain the battery and machine rooms, the manager's and public offices, and the rest rooms and lockers for the operators.

The second story is one big room and is given over entirely to the switchboard, racks, etc. Stairways are so arranged that the upper run lands in the centre of the building.

The branch exchange buildings are so placed on the lot and the arrangement is such that future additions can easily be made by extending the structures to the rear. The type of building adopted by the Home Telephone Company for its sub-exchange purposes represents the latest and most complete ideas in the matter of sub-exchange telephone building construction and has already been taken as a model for a number of like buildings throughout the country. These buildings when complete will house the latest type of multiple lamp line signal central energy switchboards of 7,200 line ultimate capacity, which, with the necessary outgoing and incoming trunk lines, etc., will make a modern and up-to-date equipment.



Type of Buildings Which are Being Erected for the Branch Exchanges of the Home Telephone Company, Detroit, Mich.

MEETING OF OHIO MUTUAL COMPANY BRINGS OUT REPORTS OF SUCCESS.

AT Delta, O., the stockholders of the Citizens' Mutual Telephone Company came together early in the year for a discussion of subjects of common interest and the election of officers. The election of officers was as follows: President, T. H. Fraker; vice-president, A. Waldeck; secretary, E. G. Dailey; treasurer, C. A. Traill; trustees, Geo. Newell, Earl Slagle, C. D. Eberly and O. R. George.

Thirteen new stockholders joined the organization on the day of this meeting. The company offers an interesting example of what can be done in the way of building up a telephone service in a moderate size community in a short time, as when it commenced business on April 14, 1906, it installed twenty-six telephones. The company is operated on the mutual principle, and has to-day one hundred and seven telephones in actual service, while one hundred and twenty-six members have paid their dues, orders for the remaining telephones having been placed but the instru-

Digitized by Google

ments not yet installed. This company has made arrangements which secure to its members the free use of about five thousand telephones, while the building of twenty-five miles of toll line, which is shortly to be undertaken, will put its subscribers in communication with four more exchanges, having a combined list of nearly one thousand subscribers. The Citizens' Mutual Company is a member of an association known as the Mutual Telephone Companies of Northwestern Ohio, in which each company is represented by one delegate. The officers of this association are: President, J. H. Leist, Liberty Center, O.; vice-president, Henry Briney, McClure, O.; secretary, E. G. Dailey, Delta, O.; treasurer, E. C. Woodward, Liberty Center, O.

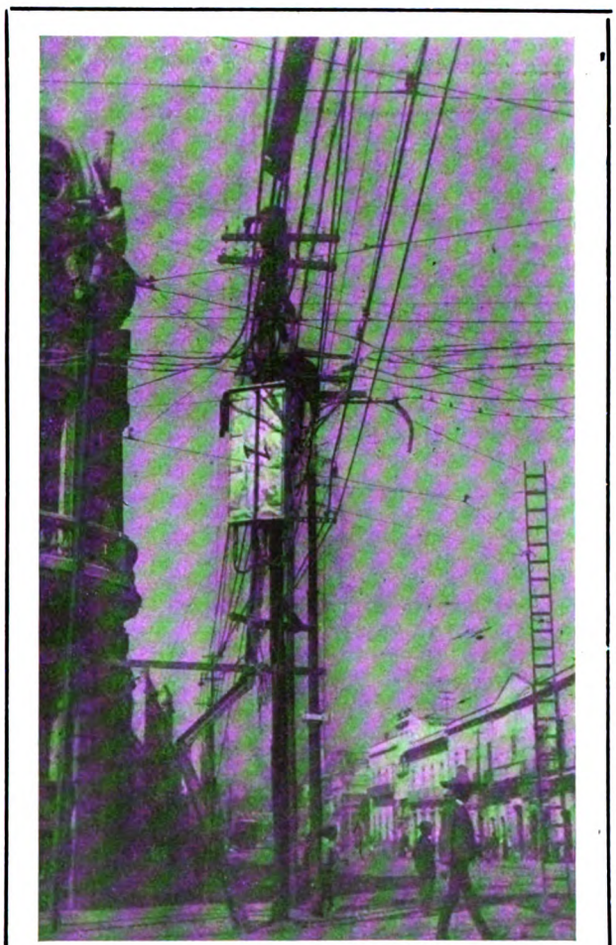
NEWS OF TELEPHONE PROGRESS IN MEXICO.

By "Noleye."

THE new Ericsson Independent exchange in the city of Mexico is nearing its completion. Underground ducts are all laid, and the greater part of the 600, 300 and 100-pair cables are now drawn in. Instead of the ten kilometers of underground ducts as first planned, nearly fifty kilometers have been laid down, some of the extreme ends of the routes reaching out into the suburban towns. The cross-connecting room is very busy and the distributing gangs are running branch cables up to the flat roofs of the buildings in every block, where they are divided up in ten and five pair branches, to serve each house.

There is not an open wire to be seen anywhere within the prescribed underground district, and as all the small cables which are run along the parapets and sides of the walls will be encased in wooden moulding to protect them from injury, the chances of trouble are reduced to a minimum.

In striking contrast are the lines of the Bell company, and occurrences like the one shown by the photograph reproduced on this page are quite common. The overloaded iron pole was broken in three places, by a so-called "accident," which happened late in February. Of course hundreds of subscribers were cut off and burned out in consequence of the crosses with the trolley wires, and some of them are not in order yet.



Bell Construction in Mexico City—Metal Pole Broken Down by Overloading, at Corner of Rosales and Punta Alvarado Streets.

The central energy board of the Ericsson company is connected up, and four operators are already kept busy making connections for the company's service lines and a few other lines.

The country lines (trunks to the suburban towns) are being fitted with cross-arms, braces and stays, ready for the stringing of wires.

In the State of Vera Cruz Messrs. de Corbera and Sitzenstatter have obtained a franchise for fifty years for exchanges in Vera Cruz, Xalapa (the State capital), Orizaba and Cordoba, and such other cities which they wish to place on their list, and for lines connecting these cities. To provide for any contingency, there is a provision in this concession which gives the company operating the exchanges and lines referred to the right to establish wireless telephone systems between all the cities which they have connected by ordinary lines, and also providing that no other similar wireless installation can be erected between any two points in the State, which might in any way interfere with the good working of the installation of the concessionaires. Some New York capitalists are interested in this franchise and it is understood that some of their engineers are en route for Mexico to study the proposition at an early date. Once the lines of this company are built between Vera Cruz and Orizaba, the most important step toward a long distance line between Mexico City and the seaport towns will be completed. It will not be many months afterward that the more densely populated portion of the Republic may count upon an efficient long distance service.

INDEPENDENT COMPANY GETTING MUCH BRANCH EXCHANGE BUSINESS IN JOHNSTOWN, PA.

NEW buildings which are being erected and a number of the foremost business establishments in Johnstown, Pa., have made arrangements for branch exchange service, and will obtain switchboards and instruments from the Johnstown Telephone Company, with which trunk lines will connect. For some time past the larger business establishments have been giving special attention to branch exchange service, and many of them have installed this system It has given such good results that business houses are adopting it rapidly, finding that by its use they are able to make the service of the Johnstown Telephone Company very valuable to them. At the present time the Independent system has grown to very good proportions, having in the neighborhood of 4,700 subscribers, of which about 500 have been added since the last directory was published, in September, 1906.

CANADIAN INDEPENDENTS IN HALDIMAND COUNTY CONSOLIDATE.

A FEW months ago a number of local Independent telephone companies were organized in Haldimand county, and franchises were granted in Caledonia, Hagersville and Dunnville. Recently these separate companies, believing it to be to their interests to form a closer association, finally came together and merged their interests in a new organization, which has been given the name of the Dunnville Consolidated Telephone Company, Ltd. It has obtained a charter empowering it to conduct a telephone business in the county of Haldimand, and the townships in Walland, Lincoln, Wentworth and Brant, immediately adjacent to Haldimand. Its charter gives this company the right to operate lines up to within a few miles of Hamilton, and practically up to the limits of Brantford.

The success of the company in obtaining subscribers is said to have been extremely good. Reports show that in Caledonia several days ago fifty subscribers' contracts were obtained in the village, and seventy among the neighboring farms, and that work is going on rapidly. At Wellandport, twenty subscribers were obtained in one evening, and similar hearty support has been received at other places. The Dunnville company now reports over four hundred subscribers, with new ones coming in every day. This is not the only successful Independent company in Haldimand county, as in the southwestern part the Erie Telephone Company, Ltd., is doing very well.

TELEPHONE PATENTS

TELEPHONE CALL REGISTER.

Joseph J. O'Connell, Chicago, Ill., patents (No. 837,951; dated December 11th, 1906; filed July 19th, 1902; serial No. 116,164) and assigns to the Western Electric Company, Chicago, Ill., a telephone call register.

At the subscriber's station is a call recording device of the form described in the patent, consisting of a train of wheels and other mechanism, with proper means of controlling it to effect the registration of calls. At the central office is provided a special cord circuit, by which the operator may cause the registering device to transmit over the line a series of impulses which will cause the number of calls registered up to that time to be indicated on a recording device. The transmission of this record does not affect the condition of the apparatus at the subscriber's station in the arrangement covered by this patent.

TELEPHONE SYSTEM.

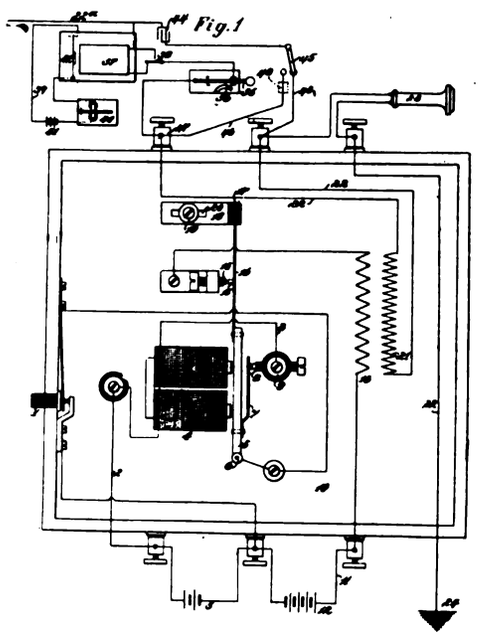
Isidor Kitsee, Philadelphia, Pa., patents (No. 846,413; dated March 5, 1907; filed April 8, 1904; serial No. 202,209) a telephone system.

This patent describes a system designed with the object of providing an arrangement of circuits which will permit a large number of subscribers' lines to be accommodated on a switchboard. It also describes means of simplifying the construction of a board, with the object of allowing a large number of connections to be brought into a limited space.

ELECTRIC CALLING APPARATUS.

Charles Adams Randall, New York, N. Y., patents (No. 841,476; dated January 15, 1907; filed December 22, 1903; serial No. 186,254) an electric calling apparatus.

This invention covers a device for the calling of telephone instruments used in connection with telegraph instruments on



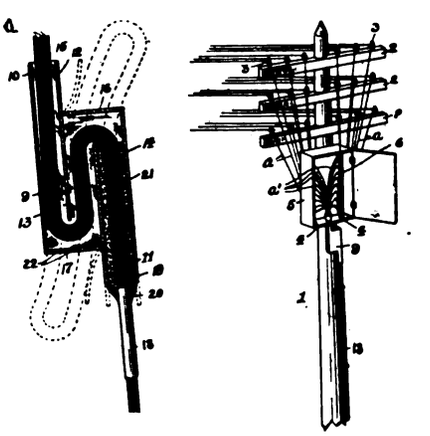
a composite line. When push button 1 is closed it completes a circuit through the magnet of vibrator 4, including the contacts 7 and 8 and battery 3. This starts the vibrator arm in motion, alternately opening and closing contacts 14, 15, these contacts being closed when contact 8 is open and vice versa. Contacts 14, 15 are in series with the primary winding 13 of an induction coil, battery 12 supplying the energy.

The action of the vibrator causes an alternating current to be produced in the secondary winding 21, which passes out to line. Receiver 23 or some other call receiving device is used for the reception of the alternating currents, which produce the required signals, consisting in the case of the telephone receiver of a humming noise, without affecting the telegraph instruments on account of their high frequency.

POT HEAD.

William Callahan, South Bend, Ind., patents (No. 845,614; dated February 26, 1907; filed May 10, 1905; serial No. 259,719) a pot head.

This invention relates to a cable terminal of the pot head



type. A receptacle 9, made of lead, has extended walls 13, 14, which serve to divide the chamber into three communicating compartments, through which the short rubber insulated wires 15, connecting the cable conductors to the overhead wires, may be led. These wires may be readily placed, owing to the fact that the upper and lower ends, 16, 17, are hinged and may be swung outward, permitting the hands to be inserted. After connections are made and the wires suitably arranged, the pot head may be soldered to the lead sheath of the cable 18 at point 20, after which the compartment 21 may be filled with a compound to seal the joint. As the bottom, 7, of the pot head is perforated, any moisture finding its way along the wires and dripping from them will pass out before going to the portions nearest to the paper covered cable wires.

INTERCOMMUNICATING SYSTEM.

William W. Dean, Chicago, Ill., patents (No. 843,329; dated Feb. 5, 1907; filed June 15, 1903; serial No. 161,534) and assigns to Kellogg Switchboard and Supply Co., Chicago, Ill., an intercommunicating system.

In the system described in this patent a pair of line wires extend from the positive and negative poles of batteries respectively, through windings of a retardation coil and thence in multiple to the line springs of jacks at the several stations. Three point jacks are used and the third connection is multiplied

OUR '07 CATALOGUE SENT ON REQUEST

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE CHEAP—100 series telephones with Ericsson transmitters and Holtzer-Cabot generators. Good as new. Address R. Valentine, Pres., Independent Telephone Ass'n of Wisconsin, Jamesville, Wis. 783

FOR SALE—500 single pole telephone receivers; 75 Stromberg-Carlson 4-bar hand generators in oak boxes. new; 900 pair 16 ohm electro-magnets, good ones. Auburn Telephone Co., Auburn, N. Y. 792

FOR SALE—Portable gasoline power winch complete: built for pulling cable. Will do the work of five men. A bargain. Write for description. J. W. Wright, 1304 Arch street, Philadelphia, Pa. 797

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

WANTED—First class wire chief for common battery plant, New York State. None but first class man need apply. Address, stating experience and references, Box 785, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 785

WANTED—A young telephone man, college graduate preferred, in the literary department of successful concern. Salary to start will necessary be small, but work offers exceptional opportunity for growth. Address, Box 787, care AMERICAN TELEPHONE JOURNAL, 100 William Street, New York. 787

WANTED---Continued

WANTED—Young college graduate, with some operating or traffic experience, for special work. State full particulars, education and experience. Address, care AMERICAN TELEPHONE JOURNAL, 100 William Street, New York. 789

WE are constantly in need of experienced men to work on high grade telephone apparatus, particularly assemblymen. The Wire & Telephone Company of America, Rome, N. Y. 794

CABLE SPLICER wants position. Experienced. Best references. Address, Box 796, care American Telephone Journal, 100 William Street, New York. 796

WANTED—Experienced telephone solicitors. Zenith Telephone Company, Duluth, Minn. 798

POSITION WANTED—Am telephone manager, twelve years with one company; last position charge of district five thousand telephones. Resigned last year to embark in business. Venture not panning out well and would like to re-enter the service. Last position paid me one hundred and forty dollars a month. Address, Box 799, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 799

WANTED—Position as manager of telephone exchange. Have had extensive experience. A large plant preferred. Can give good references. Address, Box 800, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 800

WANTED—Telephone inspector, familiar with automatic equipment. Must be a first class man, familiar with all details of Strowger Automatic. Good wages and prospects for right man. Do not apply unless you are thoroughly capable. Northeastern Telephone Co., Portland, Me. 801

Poles Must be Anchored

The question is how to do it. Why not adopt the modern D. & T. way?

D. & T. Anchors

can be driven anywhere any time of the year. They pull against solid earth and hold as well as a dead man.

TELEPHONE SYSTEMATIZING DEPT.

5 and 7 PEARL STREET (EAST), GRAND RAPIDS, MICH., U. S. A.

Digitized by Google

PATENTS—Continued.

throughout the system, but is not carried to the battery. At each station one side of a vibrating bell is connected to this third contact of the jack and the other side to a common return wire leading to positive battery. The tip of the jack is shown connected to negative battery while the ring goes to the positive side. At each station there is provided a talking set consisting of a transmitter and receiver in series with the usual hook contact. These are connected to the tip and ring of the plug respectively, while the sleeve of the plug is wired to one point of a circuit closing key, the other side of which is connected to the tip. When this key is closed, with the plug in the jack, it will be seen that it causes battery current to pass through the signaling bell of the station corresponding to the jack. When the plug at this station is inserted in the jack bearing the number of the station, in response to the signal, conversation may be carried on over the metallic line.

CARBON BALL TRANSMITTER.

Kelley M. Turner, New York, and Norton W. Johnston, Chappaqua, N. Y., patent (No. 844,635; dated February 19th, 1907; original application filed September 8th, 1905; serial No. 277,616; divided and this application filed September 8th, 1905; serial No. 277,615) and assign to General Acoustic Company, New York, a carbon ball transmitter.

This patent covers a transmitter which includes a carbon block having in its face recesses with polished surfaces which contain minute carbon balls. Mounted immediately in front of and very close to the surface of this block is a diaphragm, which retains the carbon balls in the cavities. The size of the balls varies from two-tenths to five-tenths of a millimeter in diameter. The inventor states that these balls are many times smaller than any that have been previously employed in a transmitter. With the larger balls which have heretofore been used their inertia was such as to prevent them from conforming exactly to the movement of the diaphragm. Furthermore they frequently completely broke contact with the diaphragm, and in returning to position struck its surface with such a hard blow as to produce too great a contact, and one having no relation to the sound transmitted. This is stated to be the defect which tends to produce the well-known cracking or frying sound. The small balls, on account of their reduced inertia, can attain a proportionately high rate of vibration, and thus do not produce the frying sounds which injure the efficiency of the transmitter.

REGISTERING DEVICE FOR TELEPHONE EXCHANGES.

Frank A. Lundquist, Chicago, Ill., patents (No. 846,328; dated March 5, 1907; filed October 20, 1904; serial No. 229,233) a registering device for telephone exchanges.

This device has for its object the registering of calls made from a station which are completed, without registering calls which are not answered. The apparatus is so arranged that the registering operation is completed only when the called subscriber removes his telephone from the hook.

TELEPHONE DICTATING APPARATUS.

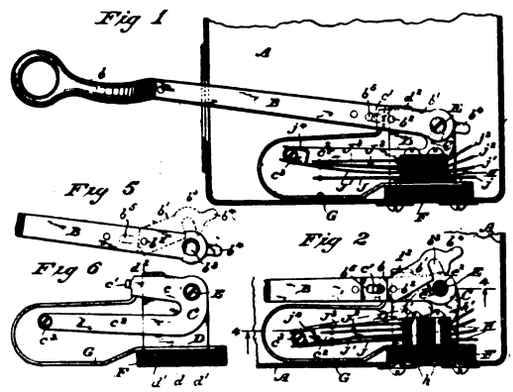
Kelley M. Turner, New York, N. Y., and William F. H. Germer, Hoboken, N. J., patent (No. 843,186; dated February 5, 1907; filed April 30, 1906; serial No. 314,000) and assign to William F. H. Germer, Hoboken, N. J., a telephone dictation apparatus.

By means of this invention communication may be carried on between persons in different rooms in ordinary conversational tones without a near approach to the transmitting or receiving instruments. The conditions are especially suited to the giving of messages to a stenographer. The inventor shows how this can be accomplished by the use of a loud-speaking transmitter and receiver respectively, joined to separate circuits extending between the two terminals. The two instruments are on separate circuits in order to prevent disagreeable side-tone and allow simultaneous communication in both directions. Should secrecy at the receiving end be desired, it may be secured by turning a switch mounted in an ordinary receiver, which cuts it into circuit at the same time throwing out the loud-speaking receiver. Auxiliary switching and signaling arrangements which have a particular application are described.

TELEPHONE HOOK SWITCH.

Charles C. Cadden, Cleveland, O., patents (No. 843,998; dated February 12, 1907; filed March 15, 1905; serial No. 250,233) a telephone hook switch.

This hook skitch has a removable lever and the contact springs and actuating member are permanently attached to a support-



ing device, which may be fastened within the telephone box, forming a complete unit. Block *F*, of non-conducting material, forms the base upon which are mounted contact springs associated with supporting member *D*, secured in place by screws and dowel pins inserted in the insulating block. Near the top of the standard, stud pin *E* forms a pivot for the hook lever, which is removable, and also the operating lever *C*, which is permanently mounted upon the pivot. Lever *B* is perforated with a hole b^5, which when in position is engaged by the side projecting lug c^5. The closing of the latch b^1 over the pivot pin *E* locks the two members together, so that any motion of the lever *B* is communicated to the operating lever *C*. Lug d^2 on the supporting standard limits the upward motion of the hook lever. Stud c^3 controls the operation of the contact springs. The hook lever may be readily disengaged from its pivot and removed from the interior of the box by releasing latch b^1 movable by the projecting lug b^4, which serves as a handle.

RECEIVER SUPPORT.

John Heisch, Jr., Allegheny, Pa., patents (No. 844,722; dated February 19th, 1907; filed December 11th, 1906; serial No. 347,283) a receiver support.

The inventor describes a receiver support comprising a metal frame with a pivoted arm for holding the receiver. In its normal position this arm maintains contacts in an open condition, but when a person listens he is supposed to press against the receiver and force the arm to one side, thus closing the contact and completing talking circuits.

TELEPHONE SIGNAL.

Gustavus W. Schuessler, Mason, Texas, patents (No. 840,589; dated January 8, 1907; filed September 23, 1905; serial No. 279,865) a telephone signal.

This patent covers a drop which signals the operator by raising its armature into view. The armature is locked and held in its raised position until released by the act of inserting a plug into the associated jack.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

CONDUIT COST.

ENGINEERS find that the cost of maintenance on conduits varies inversely with the quality of the conduits. Poor conduits are expensive at any price. The cost of laying is so high and the work to be performed is so important that the necessity for careful inspection of conduits is becoming more and more recognized.

Starting as it did thirty-five years ago, the Rochester Sewer Pipe Company soon learned that to gain the approval and confidence of the best engineers it must employ the most scientific methods to insure a uniformly high grade product. This eliminates all delay and annoyance consequent upon sorting out defective ducts. The ROCHESTER SEWER PIPE COMPANY at Rochester, N. Y., is always glad to tell prospective builders of underground systems of the special features which make its products particularly valuable.

THE TELEPHONE APPLIANCE COMPANY, Minneapolis, Minn., has recently introduced the Dollar Yankee Pole Seat. It is made from 1¼ x 1¼ inch angle iron, coated with asphaltum, and has a 1⅛ inch wood seat dipped in creosote and bolted to angle iron with three bolts.

THE CRESCENT LUMBER COMPANY will hereafter be the official company name for the Glenn-Kline Lumber Company. No other change has been made in the corporation and its headquarters still remain at Pittsburg, Pa., in the Whitfield Building. The company reports that it is in a position to furnish cypress poles in almost any specification for immediate shipment. The company has over 10,000 in stock at the present time on the sidings in its yards and is producing these poles at the rate of about 500 a day. It is in a particularly good condition to make immediate shipment of heavy poles.

THE EVERSTICK ANCHOR COMPANY, St. Louis, Mo., has received a letter from the LaBelle Telephone Company, LaBelle, Mo., stating that the Everstick anchor has been given a thorough trial on a corner pole holding twelve wires, in a low place where water stands continually, but the anchor has not moved the fractional part of an inch.

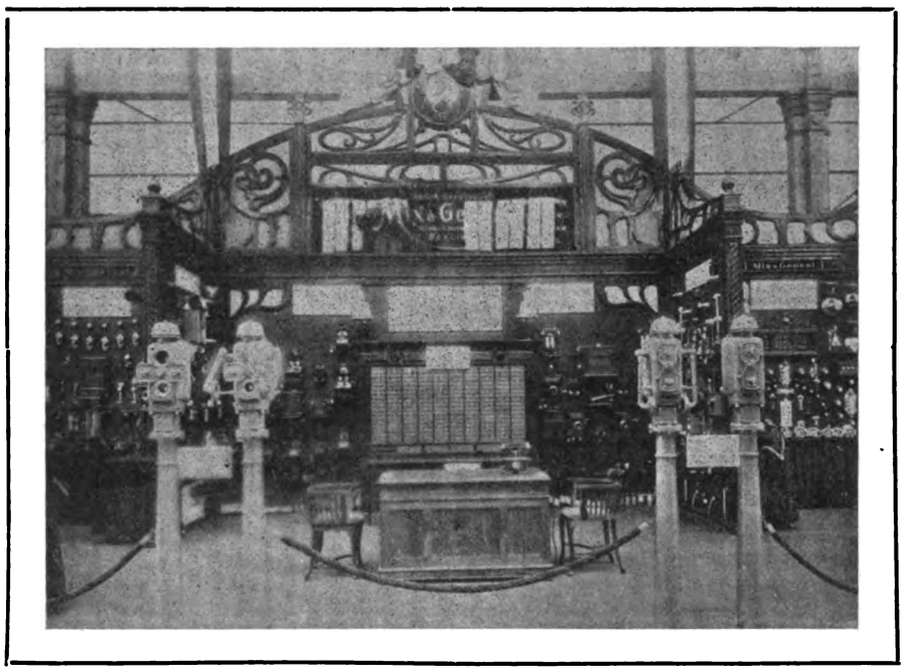
ROLFE ELECTRIC COMPANY, Rochester, N. Y., invites companies interested in telephone protectors to ask for particulars of the new Rolfe fuse box and protector. It has several new features of unusual interest.

THE CARBOLINEUM WOOD PRESERVING COMPANY, Milwaukee Wis., is prepared to send out copies of letters received from prominent engineers of telephone companies and other large users of wood, showing the actual results obtained by the use of its compound, Avenarius Carbolineum. Although this materially increases the life of telephone poles, the result is obtained at a comparatively low cost, owing to the manner of application. All that is necessary is to apply it with an ordinary paint brush.

DETROIT INSULATED WIRE COMPANY, Detroit, Mich., advertises that it can make immediate shipment of rubber insulated, twisted pair drop wire. Its new factory is modern in every respect.

GERMAN TELEPHONE APPARATUS.

THE illustrations of various different types of equipment for telephone central offices and subscribers' stations, as well as for certain other classes of electrical supplies which accompany this article were made from photographs of an exhibit of the Deutsche Telephonwerke of Berlin. They show three distinct views of a single exhibition compartment, taken at the International Exhibition at Milan in 1906, where most of the prominent European manufacturers of telephone apparatus were represented. This organization now manufactures a complete line of telephone supplies and other electrical apparatus, including an electric siren which has won very favorable comment from users in many places.



Front View of Exhibit of Telephone Apparatus of Deutsche Telephonwerke at Milan Exposition.

At the Milan Exhibition there were distributed catalogues printed in English, a number of copies of which are still available, and may be obtained by writing to the company at Zeughofstrasse 6-7, Berlin So. 33, Germany. This book tells of the simple origin of the company, when in 1887 Mr. Robert Stock, with his associates, opened a very small shop, in which Mr. Stock himself worked as turner and fitter with primitive tools. With the introduction of the multiple switchboard the firm realized the opening which existed in telephone work, and took up the design and construction of multiple boards with considerable energy. Its success led to its appointment by the Imperial German Post Office to build the comparatively large telephone exchanges at Charlottenburg, Hanover and Leipzig. Since that time the company, which since the retirement of its founder has assumed the name of the Deutsche Telephonwerke, has rapidly expanded its business, and it is building apparatus for and installing many large exchanges in Germany and other foreign countries. The line of apparatus manufactured includes telephone instruments for houses, hotels and business

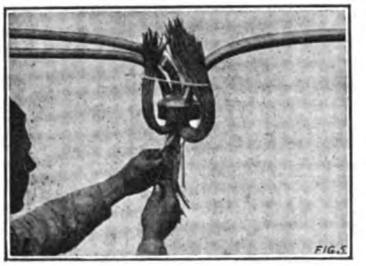
A MONEY SAVER



A MONEY SAVER

YOUR TIME

will earn money in direct proportion to your use of it. The use of the Hargis Cable Splicing Joint will enable you to save time. It will enable your regular linemen to make a better splice than an expert cable man. The picture above shows how easy it is to splice pairs by means of the Hargis Joint. They can all be tied out of the way while the splicing is going on.

The Hargis Joint is not a wiped joint in any sense of the word. The cables are simply put thru the cap and lead gasket and the lead is then poured in until the cup formed by the gasket and the brass cap is full. What wiping is done is simply to smooth off the rough edges, and does not add to the weather-resisting qualities of the joint.

HOW TO SAVE YOUR TIME

Let us send you descriptive matter of the Hargis Cable Splicing Joint shown above. By its use you can make a better splice in less than one half the time it takes to make a horizontal wiped joint, and at the same time you can always get into it by means of special tools to test out for trouble along the line.

It will pay you to write for our descriptive matter.

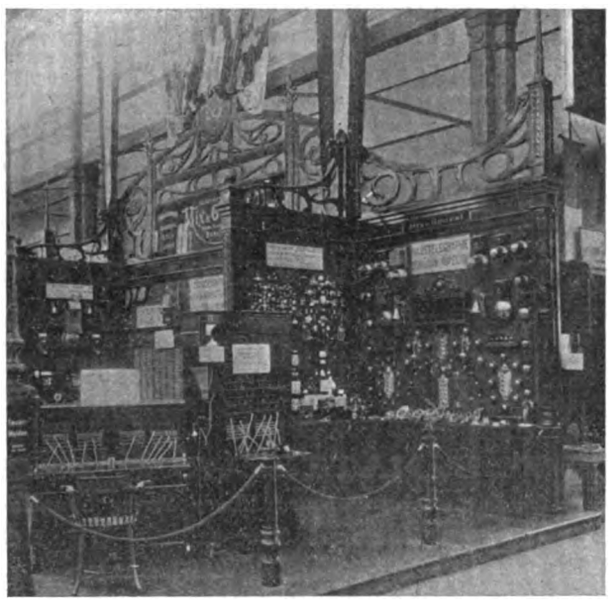
establishments of all kinds, with numerous special designs, such as those for railway and mining use, and for military purposes. Switchboards of all sizes and classes are made, and described in the company's new catalogue.

In 1905 the company at the international exhibition at Liege



A Portion of the Exhibit of Deutsche Telephonwerke at the Milan Exposition, Showing Switchboards, Telephone Bells, etc.

was awarded the highest testimonial, the Grand Prix. In 1906, at Milan, its apparatus met with equally favorable consideration at the hands of the commissioners, having been twice awarded a "Grand Prix" in addition to a gold medal.

THE SELECT TELEPHONE MANUFACTURING COMPANY, Springfield, O., will mail prices and descriptive matter of its central energy party line lockout device, over 1,000 of which are in use in the State of Ohio alone. The necessary apparatus can be connected to any make of common battery telephone and will work in connection with any common battery switchboard.

THE MERKEL MOTOR COMPANY, Milwaukee, Wis., is introducing the 1907 model "Merkel" spring frame motor cycle, for the use of trouble and repair men. During the past few years many up-to-date companies have purchased motor cycles for their men, resulting in securing a bigger day's work, which more than pays for the investment.

FISHER-STEVENS COMPANY, Charles City, Iowa, is making a specialty of sound proof telephone booths. It can supply booths from stock or make up special designs to order. Catalogue and prices will be sent on receipt of a request.

THE F. BISSELL COMPANY, Toledo, O., has just sold an order calling for 100 pole seats to the Mount Vernon Home Telephone Company, Mount Vernon, O. The Bissell Company reports that it has promptly filled this order in a single shipment. Business in other "Security" specialties is said to be very brisk. Leaflets describing this line will be sent on request.

FRANK B. COOK, 238 West Lake street, Chicago, Ill., believes that in his new No. 10 protector he has solved some of the puzzles which have in the past caused so many troubles to occur in the main distributing frame in a very effective way. He is enthusiastic about the way the apparatus is showing up in exchanges where it has been installed, and is sending out very interesting information about protectors in general, and the No. 10 in particular, to those who ask for it.

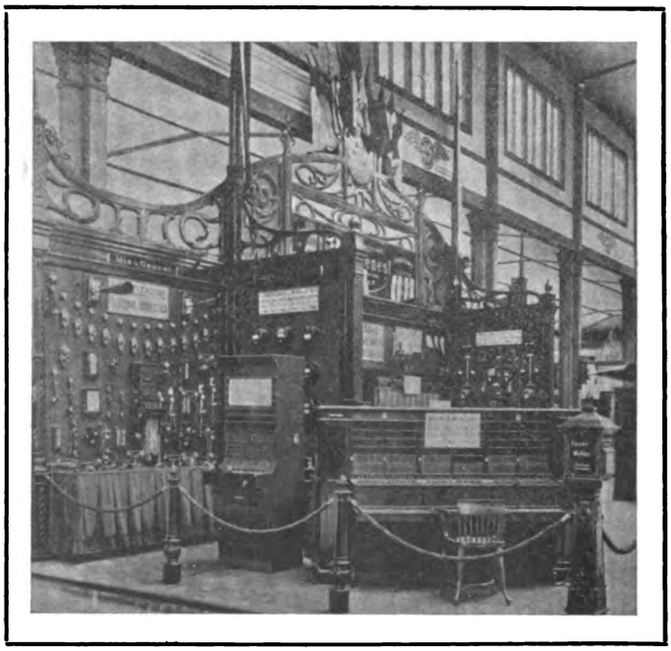
OLIVER MANUFACTURING COMPANY MOVES INTO LARGER QUARTERS.

THE rapid growth of the business of the Oliver Manufacturing Company of Philadelphia, makers of and jobbers in electrical apparatus, has necessitated its securing larger quarters and the company will, on Aprii 1st, occupy commodious offices and salesrooms at No. 1020 Walnut street. In its new quarters it will show a most complete line of interior telephone systems, annunciators, watchmen's clocks, electric lighting fixtures, etc.

Among the specialties which this company is placing on the market are the "Flexiphone" (flexible telephone), the "Flexilite," an automatically adjusted electric light, and the "Equipoise" telephone arms, which are so widely and favorably known.

THE SUMTER TELEPHONE MFG. CO., Sumter, S. C., is distributing a folder which shows an interesting ringing code for a rural party line. The signals are worked out for twenty parties in combinations of long and short rings. Fifteen parties are signaled by four rings or less, and five rings are required to call each of the other stations on the line.

The same folder bears instructions concerning simple methods of testing for and locating the causes of the most common telephone troubles. These are briefly worded, and so thoroughly practical that they should be useful many times in the course of a year when a line suddenly gets out of order. An attractive border for the sheet is formed by the use of illustrations of the various types of magneto instruments and switchboards made by



Wall and Hand Type Telephones and Switchboards Exhibited by Deutsche Telephonwerke at Milan International Exposition.

the company. Small telephone companies looking for this kind of information can obtain copies of the folder free of charge by writing to the company.

FOR TELEPHONE MEN and ELECTRICIANS

This Cyclopedia contains more information on electricity and telephony than any other work published. It thoroughly explains all the duties of the manager, lineman, switch board and troubleman. It not only fully explains the entire operation of a working telephone system, but it tells how to construct such a system. Treats fully on the Automatic Telephone and Wireless Telephony. Filled with information on electricity in all its forms—undoubtedly the best set of books for the telephone man who wishes to secure a fine position and a large salary.

Cyclopedia of Applied Electricity

Five large volumes—2,500 pages,—2,000 full page plates,—size of books 7 x 10 inches; —bound in red morocco, fully indexed, Diagrams, Descriptions, Formulae, Sections, Tables —supplemented by practical test questions—prepared especially for practical men who have no knowledge of advanced mathematics.

Regular Price $30.00—Special 30 Days $19.80

Free for Inspection

Sent, express prepaid, for five days' FREE examination if you mention **American Telephone Journal.** Pay $2.00 cash and $2.00 a month thereafter until you have paid $19.80, if you keep the books. We send for them, at our expense, if they do not meet your needs. The only reason this set is offered at such a low price is to acquaint the public with the superior instruction of the American School of Correspondence—these books being partly compiled from the instruction papers.

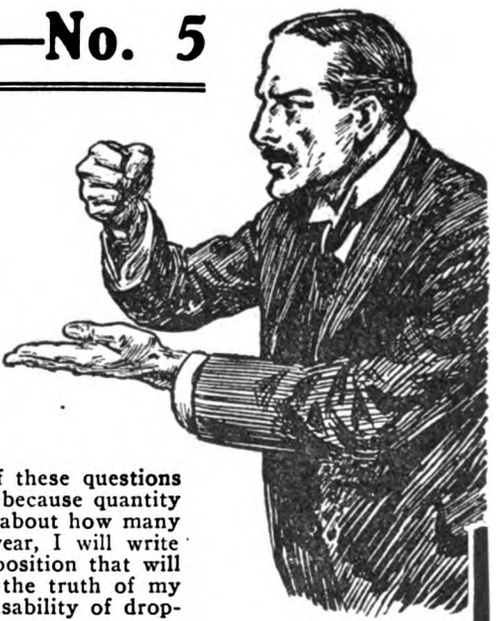
Talks With The Buyer—No. 5



I am not doing a monologue act with these talks. Perhaps you can't hear the other buyers talking back, but if you could see the letters, questions asked and orders received, you would fall in line.

A Word About Telephones

One man wrote: "What does the word 'Telephone' stand for in your name? Do you make telephones?" A natural question. A helpful suggestion. I have been so enthused over the especially attractive "supply" offerings that I have not emphasized our position as telephone manufacturers, our ability to furnish absolutely high grade equipment and at attractive prices. There are over a hundred manufacturers of telephone equipment in this country. Half of them are soliciting a share of your orders. Some exchanges have samples of at least a quarter of the number. At times you wish there were only two or three in the business. You ask: "Why should I buy 'Central' 'phones? Do they make their own equipment? Are they offering a supply house, 'mail order' grade or High Grade 'phone? Can they give me the quality that I require? Have they the factory facilities for making such prompt deliveries as I demand? Wherein is their proposition different from any one of a dozen presented to me?"

You can readily see that in this half page I cannot answer all of these questions satisfactorily either to you or to me, nor can I very well quote prices, because quantity and your individual requirements govern the case. If you will tell me about how many 'phones you are going to purchase in the next ninety days or one year, I will write you a personal letter by return mail and will make you a special proposition that will be well worth your while to entertain, submitting samples to prove the truth of my statements. Does not your good business judgment suggest the advisability of dropping me a line now before you put this paper away?

NEW COMPANIES.

LESLIE, ARK.—A Farmers' Telephone Company has been organized at Leslie, whose intention is to connect with a line being built from Campbell to Marshall.

JACKSONVILLE, FLA.—Owing to the failure to receive the service promised by the Bell Telephone Company, the citizens of the town have organized a stock company and elected the following officers: President, N. Johnson; vice president, N. Adams; secretary, A. F. Hudson; treasurer, H. C. Pease; directors, T. R. Woodson, J. W. Ettille, N. Johnson, A. W. Jackson and E. L. Patterson. The capital necessary has practically all been subscribed.

SODA SPRINGS, IDAHO.—Amended articles of incorporation have been filed by the Soda Springs-Lago Telephone Company. The capital stock is placed at $10,000, of which $2,500 has already been subscribed. The principal place of business is to be at Soda Springs, and the following directors have been elected: E. D. Whitham, J. H. DeWitt, W. H. Anderson, of Soda Springs; Davis Miles, of Niter, and C. H. Mickelson, of Bench.

DWIGHT, ILL.—The Home Telephone Company, of Dwight, has been incorporated, with a capital stock of $1,500. Among the incorporators are R. E. Bunting, John Hoffman and M. B. Butz.

HOYLETON, ILL.—The Rixman Telephone Company, of Hoyleton, has been incorporated with a capital stock of $2,500. Among the incorporators are H. W. Rixman, H. F. Rixman and F. D. Rixman.

LEWIS, IND.—Articles of incorporation have been filed by the Lewis Telephone Company, and the following directors named: C. C. Givens, W. W. Woodron, C. W. Boston, J. N. Woods and A. B. Melch. It has an authorized capital stock of $10,000, and will operate in Vigo, Clay, Sullivan and Greene counties.

ROACHDALE, IND.—An Independent telephone company has been organized at Roachdale.

ALDEN, IOWA.—An Independent telephone company is being formed by the citizens of Alden. Among those interested in the enterprise are G. E. Stronger and W. E. Trousdale, whose intention it is to apply for a twenty-five year franchise at Alden.

FARLIN, IOWA.—The Bristol Mutual Telephone Company, whose principal place of business is to be located at Farlin, has been incorporated with a capital stock of $2,500, and the following officers elected: D. J. Merriam, president; J. R. Mathews, vice president; E. A. Cairns, secretary; C. F. West, treasurer; M. T. Condon, W. J. Banning and J. A. Snively, directors.

MONMOUTH, IOWA.—Articles of incorporation have been filed by the Keystone-Monmouth Telephone Company. It has an authorized capital stock of $2,000, and its principal place of business will be located at Monmouth, from which point lines will be built to Keystone and other towns. The officers of the company are: President, D. B. Staggs; vice president, E. L. Barnes; secretary, L. B. Steward; treasurer, B. R. Dye.

ROCKWELL, IOWA.—The Rockwell Farmers Mutual Telephone Company is being organized by the farmers at Rockwell. It is to have a capital stock of $3,000, and the following officers have been named: President, J. H. Brown; vice president, D. Calahan; secretary, W. A. Storer; treasurer, J. B. McGaheran.

WASHTA, IOWA.—A Co-operative Telephone Company has been formed at Washta, with W. B. Chapman as president and F. L. Cooper as secretary.

SUMMER SHADE, KY.—The Summer Shade Telephone Company has been incorporated with a capital stock of $250, and the following are among the incorporators: W. B. Depp, J. S. Bradley and A. B. Mayfield.

JERSEY CITY, N. J.—Articles of incorporation have been filed by the Pennsylvania Telephone Company, whose purpose it is to construct telephone and telegraph lines in Pennsylvania. The capital stock of the company is given at $50,000, divided into 500 shares of the par value of $100 each, and the principal office is at 243 Washington street, Jersey City, N. J. Among the incorporators are Leonard H. Kinnard, Harrisburg, Pa.; Addison Candor, Williamsport, Pa.; S. S. Moore, Elizabeth, N. J.

CALLICOON, N. Y.—The Western Sullivan Telephone Company has been incorporated with a capital stock of $25,000, and the following directors elected: Valentine Scheidell, Jeffersonville; Louis Bauornfiend, North Branch; F. S. Anderson, Callicoon.

DE RUYTER, N. Y.—Articles of incorporation have been filed by the Re Ruyter and Lincklaen Telephone Company, of De Ruyter, whose intention it is to build lines from De Ruyter to Lincklaen. The capital stock is placed at $1,500, and the following directors have been elected: U. E. Smith, L. C. Wells, W. W. Ames, of De Ruyter, and others.

BEAUFORT, N. C.—The Old North State Telephone and Telegraph Company, of Beaufort, N. C., has been incorporated with a capital stock of $125,000. D. P. Bible, J. W. Boon and others are the incorporators.

BELLEFONTAINE, O.—The Logan County Farmers' Telephone Company, with a capital stock of $5,000, has been incorporated.

PLEASANT CITY, O.—Articles of incorporation have been filed by the Pleasant City Farmers' Telephone Company. The capital stock is placed at $2,000, and J. H. Larrick and others are among the incorporators.

CEDARDALE, OKLA.—The Estella, Cedardale & Quinlin Telephone Company, of Cedardale, with a capital stock of $5,000, has filed articles of incorporation. The incorporators are Charles Johns and Milo Smith, of Driskoll, Charles Shepard, of Cedardale, and M. C. Kelley, of Estella.

LAWTON, OKLA.—The Farmers' Mutual Telephone Company has been incorporated with a capital stock of $5,000. Among the incorporators are W. G. Kennedy and P. R. Childer, of Tampa, and C. C. Naylor, of Lawton.

LONGDALE, OKLA.—Articles of incorporation have been filed by the Dane & Longdale Telephone Company, of Longdale. It has an authorized capital stock of $10,000, and the directors are A. M. Ardey, C. E. Peason and J. P. Sharp, all of Longdale.

McLOUD, OKLA.—The McLoud Telephone Company has filed articles of incorporation, placing its capital stock at $15,000. The directors of the company are: W. Scott Yates, B. D. Glass and G. D. Yates, all of McLoud.

POND CREEK, OKLA.—The Grant County Rural Telephone Company, with a capital stock of $20,000, has been incorporated, and the following directors eletted: W. H. Proctor, W. Vansickle, L. E. Thorn and E. E. McAlister, of Pond Creek.

SHATTUCK, OKLA.—The Farmers' Mutual Rural Telephone Company, with a capital stock of $1,500, has been incorporated. The incorporators are T. J. Eldridge, W. H. Holmes, L. L. Dunihoe, McHenry Smith, O. L. Edgker, S. M. Wallace and C. T. Taylor.

WICHITA FALLS, TEXAS.—Articles of incorporation have been filed by the Bowman and Lake Creek Telephone Company, of Wichita Falls. It has an authorized capital stock of $5,000, and the incorporators are J. L. McCobkey, J. T. S. Cant, J. R. Decker, Henry Ford, J. H. Campbell and H. F. Simmons.

RIPON, WIS.—An Independent telephone company, to be known as the Ripon Rural Telephone Company, is being organized at Ripon. Arrangements have already been made for exchange service with the Ripon Telephone Company.

VOROQUA, WIS.—The English Lake Telephone Company, town of Newton (postoffice address Viroqua, Wis.), has filed articles of incorporation. Its capital is given as $2,100 and Ernst Onsorge, Alex. J. Duvenek, Herman Voght and Carl Jacob are the incorporators.

FRANCHISES.

JERSEYVILLE, ILL.—The city council has granted the Jerseyville Telephone Company a twenty-five year franchise, this being an extension of the one formerly granted. It is the company's intention to make extensive improvements in its system.

WINFIELD, LA.—The Board of Aldermen has granted the Winn Parish Telephone Company a franchise to establish an exchange at this city.

MAHNOMAN, MINN.—A thirty-year franchise has been granted to L. G. and C. H. Sanders, to construct and operate a telephone system at Mahnoman.

FARGO, N. D.—The North Dakota Independent Telephone Company has been granted the franchise for which it applied some time ago.

HOPEWELL, OHIO.—The Farmers Mutual Telephone Company, of Fostoria, has been granted a franchise to construct and operate lines in Hopewell and Seneca.

OREGON CITY, ORE.—The Home Telephone Company has been granted a franchise to operate a telephone exchange in Oregon City.

SPRINGTOWN, TEXAS.—Permission has been granted to the Springtown Co-operative Telephone Company to erect and maintain a telephone system along the Springtown and Weatherford public road.

KANAB, UTAH.—The Garfield Telephone & Telegraph Company, which operates a line from Kanab to Marysville, has applied for a franchise at Richfield. It is the company's intention to construct a line from Marysville to Richfield, and later to connect with the Independent lines of Utah for long distance service.

FINANCIAL.

MOBILE, ALA.—The Home Telephone Company, of Mobile, has increased its common stock from $33,000 to $500,000 and its preferred from $2,000 to $150,000.

DONGOLA, MO.—The capital stock of the Dongola Home Telephone Company, Dongola, has been increased from $2,500 to $5,000.

ROCKFORD, MO.—The Ebenezer Telephone Company has increased its capital stock from $500 to $1,500.

WATERVILLE, N. Y.—A dividend of six per cent has been declared by the Waterville Telephone Company.

DAYTON, OHIO.—The Dayton Home Telephone Company is consider-

THE WEEK'S MESSAGES

ing the advisability of increasing its capital stock from $1,200,000 to $2,000,000.

AMHERST, WIS.—The capital stock of the Amherst Telephone Company has been increased from $2,500 to $6,000.

WAUSAU, WIS.—At a recent meeting of the Wausau Telephone Company a dividend of 10 per cent. was declared.

COMBINATIONS.

BELLEVUE, IOWA.—It is the intention of the Bellevue Telephone Company to take over the system known as the Dennison line running to and through Tete de Morts.

GRANTSBURG, WIS.—The Farmers' Independent Telephone Company has made arrangements to take over all the Tri-State rural lines south and east of Grantsburg.

ELECTIONS.

MATTHEWS, IND.—The Matthews Telephone Company has elected A. Q. McKinney, president; A. B. Couch, vice-president; M. Winsett, secretary and treasurer.

MT. ZION, IND.—The following officers and directors have been elected by the Mt. Zion Telephone Company: Dr. Morris, president; A. R. Williams, vice-president; Levi Huffman, treasurer; Frank Huffman, secretary; B. A. Williams, manager. Directors: A. R. Williams, Dr. Morris, Levi Huffman, B. A. Williams and Frank Huffman.

MEDIAPOLIS, IA.—At the annual meeting of the Mediapolis Mutual Telephone Company, the following officers were elected: President, Henry Breder; vice-president, Herman Walker; secretary, J. L. Jones; treasurer, D. J. Kelly; manager, Amos Bolick.

CHILLICOTHE, MO.—The following officers have been elected by the Chillicothé-Bedford Telephone Company: F. Reed, president; J. Winans, treasurer; John Manning, secretary.

OMAHA, NEB.—The following officers have been elected by the Independent Telephone Company: President, F. H. Stow; vice president, B. S. Baker; secretary and treasurer, W. F. Ely.

CORTLAND, N. Y.—The following officers have been elected by the Cortland Home Telephone Company: President, C. P. Walrad, of Cortland; vice-president, W. W. Nicholson, of Syracuse; secretary, S. C. Ormsbee, Syracuse; auditor, A. W. Deas, Syracuse; treasurer, G. J. Mager, of Cortland.

FARGO, N. D.—The North Dakota Independent Telephone Company has named H. R. Lyons, of Mandan, president; J. D. Brown, Hope, vice president; Robert Jones, Fargo, second vice president; E. J. Weiser, Fargo, treasurer, A. B. Cox, Valley City, secretary.

MARION, O.—The board of directors of the Marion County Telephone Company consists of W. G. Harding, D. R. Crissinger, J. F. Prendergast, H. B. Hane, C. H. Norris, J. A. Schroeter, F. F. Guthery, S. E. Barlow, F. A. Huber, O. Wellenweber, J. W. Scott, Geo. W. King and A. E. Cheney.

NORWALK, WIS.—The Norwalk Telephone Company has elected the following officers: President, Albert Grill; vice-president, F. Muhlenkamp; secretary, Fred Vieth; treasurer, Chas. Arndt. The directors of the company are J. B. Kerrigan, Joe Mack, Herman Flock, Thos. Sullivan and John Berendes.

MISCELLANEOUS.

CONCORDIA, KAN.—The Concordia Telephone Company has arranged for connections with the Farmers' Telephone Company in Lincoln township, Republic county.

HOLDREGE, NEB.—A controlling interest in the Phelps County Telephone Company at Holdrege has been acquired by B. F. Boorman, of Lexington, the consideration being in the neighborhood of $40,000. It is Mr. Boorman's intention to take an active part in the management of the company.

SHERIDAN, WIS.—The Sheridan Telephone exchange has been acquired by Mr. F. L. von Almen, of Appleton, who recently purchased the Citizens exchange at Waupaca. The service between Waupaca and Sheridan is to be greatly improved.

WAUPACA, WIS.—The Wolf River Telephone Company, which operates lines from Waupaca to Poysippi, has been purchased by Messrs. Frisbie & Sons, of Pine River.

PERSONAL.

E. F. LYONS was appointed superintendent of the Texarkana Telephone Company, Texarkana, Tex., on March 1. Mr. Lyons is a thorough telephone man, having worked through various departments of a prominent Bell telephone company, and comes highly recommended. He will have charge of the construction, maintenance and operating departments of the Texarkana Telephone Co.

New Construction in the Field

WALCOTT, ARK.—The improvements which are being made by the Walcott Telephone Company will include the construction of a line to Paragould.

EUREKA, ILL.—It is the intention of the Eureka Telephone Company to make many improvements in its system, which when completed will give it a thoroughly up-to-date plant.

ST. ANNE, ILL.—Extensions are to be made in the lines of the West St. Anne Telephone Company.

SALISBURY, ILL.—Lines have been built by the Salisbury Telephone Company to Pleasant Grove, and an exchange is to be installed at that place.

STENDAL, IND.—The Stendal Home Telephone Company contemplates the erection of a number of new lines.

DECORAH, IOWA.—A new switchboard is to be installed at Decorah by the Standard Telephone Company, which also expects to make many other improvements in the city. A number of new toll lines are also to be erected.

EMERSON, IOWA.—The Emerson Mutual Telephone Company, which now has connections with Hastings, Henderson, Wales, Climax, Glenwood, Pacific Junction, Essex and Imogene, has under consideration the construction of a line to Macedonia.

ZENDA, KAN.—Many improvements in its system are being made by the Zenda Telephone Company.

WINTHROP, MINN.—New lines to Transit and Bismarck are to be built by the People's Independent Telephone Company, which expects also to construct a number of rural lines.

CANTON, N. Y.—The Adirondack & Home Telephone Company is installing its system at Canton.

FREDONIA, N. Y.—Considerable new construction work in Fredonia is contemplated by the Fredonia Home Telephone Co.

KENTON, O.—Among the improvements planned by the Kenton Telephone Company is the installation of a new switchboard.

SANDUSKY, O.—The Sandusky Telephone Company is making many improvements in its system.

YOUNGSTOWN, O.—The United States Telephone Company is rebuilding its line from Youngstown to Steubenville. It also proposes to put in a number of new lines connecting with Salem and other points, giving the Youngstown Telephone Company's subscribers much better service.

CHESTER, S. C.—The system of the Chester Telephone Company is being put in first-class condition.

NASHVILLE, TENN.—It is quite probable that work will be commenced at once by the Home Telephone Company upon its local system in Nashville.

BROWNSVILLE, TEXAS.—It is the intention of the Brownsville Telephone Company to construct a line along the right of way of the St. Louis, Brownsville & Mexico Railway Company, from Brownsville to Fordyce and Robstown.

CALDWELL, TEXAS.—New lines are being constructed and many other improvements made in its system by the Trans-Texas Telephone Company at Caldwell.

UNDERGROUND.

EUREKA, ILL.—The wires of the Eureka Telephone Company are to be placed underground in Eureka.

LOUISVILLE, KY.—All telephone wires in the business districts of Louisville are to be placed underground.

FRANKLIN, LA.—An ordinance is being considered by the town council requiring all telephone wires to be placed in conduits.

WATERVILLE, MINN.—Considerable conduit work is being done by the Cannon Valley Telephone Company in Waterville, and wires are also to be placed underground in Le Sueur Centre.

OMAHA, NEB.—The Omaha Independent Telephone Company will in all probability place all of its wires underground in Omaha.

MANSFIELD, O.—The Mansfield Telephone Company, which is to spend $10,000 in improvements, expects to place all its wires underground in the business sections of Mansfield.

WHEELING, W. VA.—The Ohio Telephone Company is to place its wires in conduits in Wheeling, W. Va.

MILWAUKEE, WIS.—A considerable amount of underground work is to be conducted by the Milwaukee Independent Telephone Company.

John Wanamaker says: "If there is one enterprise on earth that a 'quitter' should leave severely alone, it is advertising. To make a success of advertising one must be prepared to stick to it like a barnacle on a boat's bottom. He should know before he begins it that he must spend money—lots of it. Somebody must tell him, also, that he cannot hope to reap results commensurate with his expenditure early in the game. Advertising doesn't jerk: it pulls. It begins very gently at first, but the pull is steady. It increases day by day and year by year until it exerts an irresistible power."

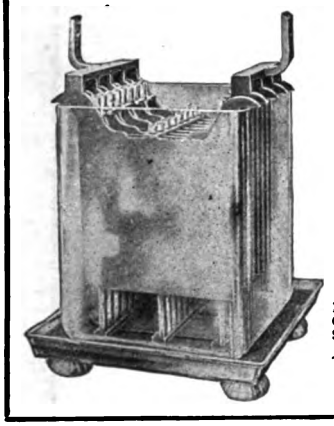
DO YOU KNOW

That there is scarcely a jobber in the country who can make prompt deliveries on Locust Pins? By contracting with several factories early in the season for their entire output, we have the advantage of being able to ship AT ONCE direct from ST. LOUIS or the factory any quantity of 1¼x9 or 1½x9 Locust Pins desired.

OUR PRICES ARE RIGHT, TOO.

THE WESCO SUPPLY CO.

Fort Worth, Tex. St. Louis, Mo.



CLAIMS FULFILLED

Viewed from the standpoint of scientific theory, no other storage battery plate can compare, detail for detail, with the Gould Integral Plate. Many of the largest Telephone Companies in the United States have purchased Gould Storage Batteries on the *very apparent* merit of our battery. It is a most significant fact that in almost every such case *repeat orders* have followed the first test order. The Gould Battery has succeeded because it has made good our claims for its unusual merit and economy.

Write for our catalogues.

JUST A SUGGESTION

Take one of your busy 4-party lines and equip it with "POOLE" Lock-Outs. Leave it in service a month and then see how many of the four will stand a raise of $3.00 a year rather than go back to the old way. We know the answer, but we want your subscribers to impress on you the fact that the "POOLE" Lock-Out is a rate-raiser.

It won't cost you anything to try it, because we will loan you the Lock-Outs free and there is no other equipment required. Write today for our Booklet AL-2.

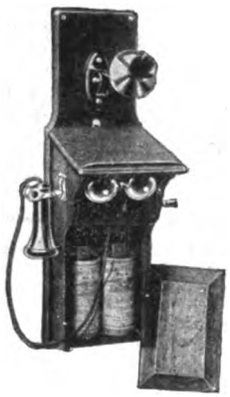
DEAN TELEPHONE APPARATUS

THE DEAN LOCAL BATTERY MAGNETO TELEPHONE

A practical manager should be a student of methods to increase revenue, and decrease costs, and advocate



such equipment as will materially assist in accomplishing that end.

The pictures shown on this page represent the most compact and efficient telephone made.

Standard Dean circuits and apparatus are incorporated in this FOURTEEN TWENTY TYPE telephone. The talking parts—the most important features of a telephone—are the best that can be had, consisting of the well-known Dean transmitter, receiver and induction coil. The current consumption of this talking apparatus is as small as practical, for the best long distance transmission, in fact so small that two dry cells will give the maximum results for a period of from one and a half to two years' service. This telephone equipment is housed in a

highly finished piece of woodwork and is as good in every respect as it looks.

Send for descriptive bulletin No. 101 mailed free upon request.

Stromberg-Carlson Telephone Mfg. Company

Rochester, N. Y. March 30, 1907.

TO THE EXCHANGE MANAGER AND TELEPHONE USER:

Probably you have decided to order some STROMBERG-CARLSON cords or do something to improve your service.

It's the need of a remedy for that constant cord annoyance -- isn't it?

THEN TAKE THIS OPPORTUNITY. IF UNDECIDED, put whatever doubt you may have with the same amount of confidence in what we have proven to others is true and write for some samples.

A summary of results will be - no more cord annoyance -- maintenance expense reduced -- better service -- the best cords -- satisfactory prices.

To date we have made ninety-nine (99) different kinds of cords -- surely, there is a cord in this assortment that will meet your requirements.

No orders are too large to overtax our capacity or too small to receive our best attention.

A new illustrated catalog entitled "Cords" is ready to mail -- it's another story.

Yours very truly,

Stromberg-Carlson Tel. Mfg. Co.

AS AN INVESTMENT

there's nothing more safe, more sure, more profitable—in the telephone business—than the securities of an Independent telephone company operating our AUTOMATIC TELEPHONE SYSTEM—

BECAUSE it gives more service, better service, prompter service, more accurate service than a manual system (and also an absolutely secret service, which no manual system can give) and

BECAUSE it costs less to operate, less to maintain, less to enlarge than a manual system, or

TO SUM IT ALL UP, the AUTOMATIC TELEPHONE SYSTEM produces a better telephone service, commanding a higher price, at less cost than inferior service can be produced for by a manual system.

THAT IS THE REASON WHY the AUTOMATIC TELEPHONE SYSTEM makes the securities of the company using it safe, stable and profitable, and why it has been adopted by the Independent telephone companies in the following cities:

Aberdeen, S. D.
Akron, Ohio.
Allentown, Pa.
Auburn, Me.
Auburn, N. Y.

AUTOMATIC ELECTRIC CO.

Van Buren and Morgan Sts., Chicago, U. S. A.

LOOKING FOR TROUBLE?

Suppose you have a line in trouble—grounded or open. You don't know the exact location, but you send out a troubleman to hunt it up and clear it. It may take him an hour or a day. Meanwhile the subscriber is getting hot under the collar and saying things about telephones in general and yours in particular.

If you have a Pignolet voltmeter or volt-ammeter you can determine the approximate location and also get an idea of the nature of the trouble. With the information your troubleman can find the fault in jig time, and you will have prevented the subscriber kicking by giving him service at the earliest possible moment.

Does it pay to be informed? You ought to know.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit
78 CORTLANDT ST., N. Y.

The metals of which ROEBLING DOUBLE GALVANIZED TELEPHONE WIRE is made are of the best quality to be obtained. The wire is drawn and galvanized by methods which have made ROEBLING wire in demand wherever wire is used. It is the cheapest wire to use, not because it is the lowest in price, but because it will last years after low-grade wire has been discarded.

JOHN A. ROEBLING'S SONS CO., Trenton, N. J.

THE IRON WIRE BALLAST

APPLIED TO

OPERATORS' RINGING LEADS

¶ **LAMP INCANDESCENT RESISTANCE IS WASTEFUL.** The resistance of the carbon filament under normal ringing conditions is 700 Ohms, and the drop in voltage across this resistance is an absolute and unnecessary waste. When ringing on a short circuited line, the resistance of the carbon filament drops to 400 Ohms and will, of course, protect the voltage of the other operators. The action is the reverse of what is needed, as the high resistance **appears when it is not needed.** Only a normal resistance appears when protection is desired. The temperature co-efficient is negative in action.

¶ **PROTECTOR RELAYS ARE UNRELIABLE.** They are marginal in action, and cannot be relied upon when needed. Even if the relay does operate, the contact is liable to fail and cause a loss of voltage under normal conditions.

¶ **THE V-B IRON WIRE BALLAST IS BOTH ECONOMICAL AND POSITIVE.** With a ballast there is no possibility of failure in action, as the qualities of the filament cannot change. The action is as instantaneous as a carbon lamp and the temperature co-efficient is positive. Under normal ringing conditions the resistance of the ballast is 25 Ohms. When ringing upon a short circuited line the resistance of the ballast is 400 Ohms.

¶ **THE VOTE-BERGER COMPANY, La Crosse, Wisconsin, sole owners of the V-B Iron Wire Ballast Patents, are now prepared to make immediate deliveries on ballasts equipped with Edison bases for operators' ringing leads.**

¶ **A line from you, addressed to Department C, THE VOTE-BERGER COMPANY, La Crosse, Wisconsin, will bring you complete and interesting information regarding this and other applications of the iron wire ballast.**

¶ **If you contemplate purchasing a common battery switchboard, do not delay sending in your plans or specifications. Sales engineers of THE VOTE-BERGER COMPANY will call upon you if you so desire.**

Iowa's Great Convention

By John W. Carey.

THE men who have carried the development of rural telephony farther than anywhere else in the world—who have built up efficient local service in hundreds of cities and towns and are now knitting their plants into a comprehensive whole by a system which provides for a fair interchange of connections and a just division of profits have just met in the greatest State convention ever held by telephone men. Boosting, carefully planned and long continued by a group of efficient and enthusiastic officers and hearty co-operation by members showed their value when, on the first day, March 19th, nearly four hundred delegates gathered at Sioux City to tell of progress in the past and plan for greater extensions in the future. Before the close of the convention many more came. Each man wore a card bearing a number, so that his name could be learned by looking at the register.

P. C. Holdoegel, Rockwell City, Ia., opened the convention with an address which showed the almost total failure of the extraordinarily active campaign of the Bell company during the past year. Soliciting for sub-license contracts and for subscribers, hundreds of whom have been offered free service, which is paid for in places where there is no competition, have failed to dampen the enthusiasm or impede the progress of the Independents. The ratio of Bell to Independent telephones in the State is now 1 to 7.

Group of Delegates to the Iowa Convention. Sitting in Front Are Jas. B. Hoge, P. C. Holdoegel and George T. Hewes. H. S. Baker, Chairman of the Entertainment Committee, Stands in the Right Foreground.

Mr. Holdoegel stated that the new constitution which the association adopted last year has worked very successfully. Under it there are now five districts in the State, each one of which has a president, who, by virtue of his office, is a vice-president of the association. Working under him is a captain in every county in his district. These captains are the men on the ground who combat the efforts of the Bell company.

Mr. Holdoegel urged a still closer and more complete district organization, that a more solid front may be presented to the opposition. The work of the field agents in localities where competition has been particularly vigorous was warmly commended.

F. McNally, of Carroll, Ia., read a paper on the topic, "Is It Advisable to Appoint a State Toll Line Inspector?" W J. Stanton, of Waterloo, advocated "The Standardization of Toll Line Companies."

The evening of the first day was given over to the exhibitors, of whom forty had fine displays on the second and third floors of the Hotel Garretson. The agents for the manufacturing companies expatiated upon the merits of all kinds of telephone appliances. All of the larger companies that make telephones and telephone appliances sent men to the convention. These representatives made the Garretson rotunda a vast billboard, upon which were lined hundreds of catchy signs. The manufacturing agents gave the delegates the best of treatment, and were unanimously voted to be good fellows and worthy of hearty support.

The ball was started rolling on Wednesday by Mayor W. G. Sears, of Sioux City, who expressed his hearty appreciation of the work being done by the Independent telephone men. He said the convention was one of the best ever held in Sioux City. He was impressed with the earnestness and intelligence with which the delegates had discussed their mutual problems. He complimented the "Independents" upon their fight against the

Digitized by Google

telephone trust, and spoke in particular of the Sioux City Telephone Company, saying that Sioux City felt a great pride in it.

A large part of the forenoon session was devoted to greetings from representatives from various states. E. H. Hart, of Fargo, N. D., delivered the greeting of his State to the Iowa Independent Telephone Association. R. E. Mattison, of Lincoln, Neb., secretary of the State Association and manager of the Telephone Traffic Association of Nebraska, delivered greetings from Bryan's commonwealth. Judge C. B. Kennedy, of Canton, S. D., president of the Independent Telephone Association of South Dakota, was to have represented his State in the list of greetings, but arrived too late to carry out his part of the programme in the morning, but he did his duty nobly in the afternoon. E. H. Moulton, of Minneapolis, who was to have spoken for Minnesota, failed to appear. C. A. Hollis, of Hudson, Ia., agent for the Independent Telephone Association, spoke of the work that he has been doing in an effort to improve toll line service.

On Wednesday the afternoon was devoted to the consideration of problems of interest to farmers' and mutual companies.

The big feature of the Wednesday meeting was the paper of J. B. Hoge, of Cleveland, O., president of the International Independent Telephone Association.

On Wednesday morning the association voted for the appointment of a committee to investigate the advisability of forming a uniform toll rate in Iowa. Harold Beyer, of Grinnell, Ia., chairman of a committee which, in secret session the previous night, discussed the rate question for three hours, submitted a resolution, calling for the appointment of a committee of five to make an investigation, and that it be given power to make or change the existing rates. E. E. England and C. A. Hollis were the other two members of the committee. The traffic arrangements committee of the independent clearing house at Des Moines had consulted with this committee.

J. S. Bellamy, of Knoxville, vigorously opposed the resolution. He said that in his town the Bell people had made a cut, and that he did not think it fair that a rate schedule should prevent him from meeting this competition.

P. C. Holdoegel, Re-elected President of the Iowa Independent Telephone Association.

James B. Hoge, president of the International Association, spoke on this question as follows:

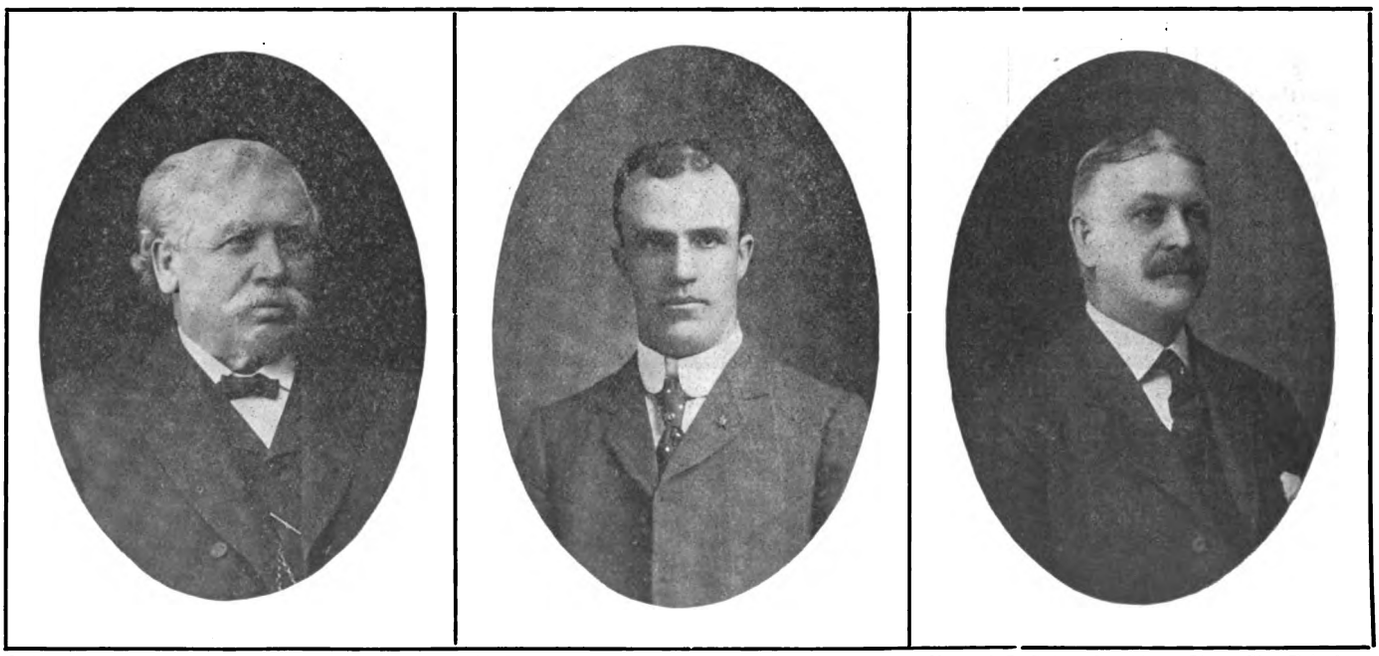
"I think, gentlemen," he said, "that you will find that the more cutting business you do, the worse off you will be. I would advise you to stick to the average of six-tenths of a cent per mile, which I think is as low as you can charge with profit. Ten cents is usually the minimum charge for any service, and I would not go below that."

President Holdoegel explained that the convention was not attempting to fix a uniform rate at this time, but was merely trying to find out if there is a demand for a uniform rate in Iowa.

Upon calling for the vote the resolution was adopted unanimously. Mr. Holdoegel will appoint five members, who will look over the field within the next thirty days.

Howard S. Baker, president of the Sioux City Telephone Company, was in charge of the arrangements for the convention and is the recipient of numerous congratulations upon the success of the meetings. Good entertainment was provided for the city's guests. Many of the delegates found sights of interest at the stockyards and the packing house, which make up one of Sioux City's principal industries.

On Wednesday evening a fine vaudeville entertainment was presented at the Lyric Theatre. E. H. Martin president of the E. H. Martin Telephone Company, Webster City, gave a make-up sketch, which showed his versatility and delighted all his hearers. Mr. Martin, who is one of the best-known telephone men in Iowa, has long been prominent in association affairs. Eleven years ago he issued a call to telephone men which resulted in so large an attendance that the Iowa Telephone Association was formed, and he was elected president in honor of his activities. Since that time he has taken a leading part in promoting the cause of Independent telephony in his State. At the banquet on Thursday evening "Happy Cal" Caldwell was toastmaster, which is another way of saying that it was a great success.



Judge C. B. Kennedy, Who Brought Greetings from the South Dakota Association, of Which He Is President.

C. C. Deering, Re-elected Secretary of the Iowa Association.

Howard S. Baker, President, Sioux City Telephone Company.

Digitized by Google

By unanimous vote P. C. Holdoegel, of Rockwell City, Ia., on Thursday, the closing day of the eleventh annual convention of the Iowa Independent Telephone Association, was elected to succeed himself as president of the association. This action breaks a precedent which has been an unwritten law of the organization for ten years. It had been customary to give each president but one term, upon the theory that the honor should be passed around. Mr. Holdoegel's record during the past year in office and his personal popularity united to bring about the request that he accept the office a second term. Mr. Holdoegel agreed to do so. During the first two days of the convention he discouraged the nomination, but when the unanimity among the delegates became apparent he yielded. In placing the name of Mr. Holdoegel before the convention James H. Shoemaker, of Waterloo, representing the Northwestern District, drew a comparison between the position that President Roosevelt is in and the status of the president of the association. "The American people," he said, "may find it necessary to overrule the wish of their executive, and this afternoon I think that this convention will overrule precedent and the wish of President Holdoegel and name him for a second term."

E. E. England.

Charles C. Deering, of Boone, Ia., was re-elected secretary and treasurer. He has held the office for eight years. The executive committee is composed of J. S. Bellamy, Knoxville; J. C. Thorne, Fairfield; E. H. Martin, Webster City; George M. Bandy, Des Moines.

The re-election of these men, composing the entire board of officers during the past year, is without precedent in the history of the association. This has been the most progressive year since the association was organized, and credit for the success is freely given to the officers who have been so active in promoting the common cause.

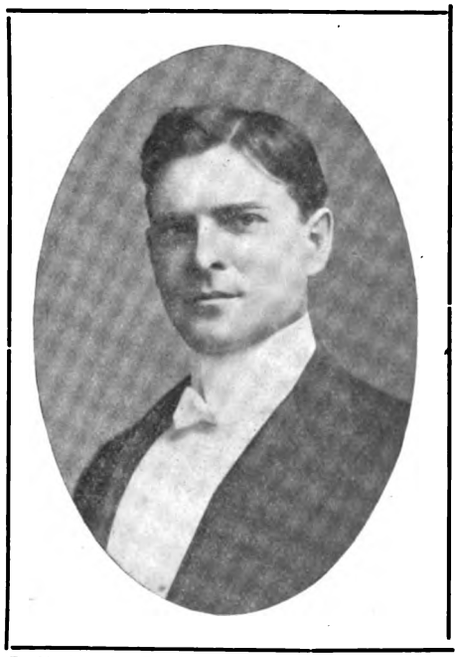
C. H. Smith, Secretary, the New State Telephone Company, Sioux City, Ia.

The vice-presidents named were: First vice-president, E. E. England, Mt. Pleasant Ia.; second vice-president, O. A. Repass, Dallas Center, Ia.; third vice-president C. A. Peterson, Manchester, Ia.; fourth vice-president, H. A. Kinney, Woodbine, Ia.; fifth vice-president, J. E. Green, Brighton, Ia. Cedar Rapids was named without contest as the 1908 convention city. During the first two days of the convention there was a Des Moines boom, which by the last day had faded away into nothingness, the hustling Cedar Rapids delegates having brought around to their way of thinking such a large majority of the delegates as to discourage the Des Moines delegates from making any fight on the convention floor.

Resolutions were adopted complimenting Howard S. Baker, president of the Sioux City Telephone Company and chairman of the entertainment committee, and C. H. Smith, secretary of the New State Telephone Company and chairman of the programme committee, upon the success of the convention, which was unanimously voted to be one of the most successful sessions in the history of the organization. Papers were read Thursday by E. E. England, Mt. Pleasant, Ia., on "Independent Long Distance," and Roy A. Walker, Des Moines, on "Hints on the Management of Traffic."

The paper by George T. Hewes, of Des Moines, manager of the Clearing House, afforded a means of judging the work which has, during the past year, been conducted by himself and his associates with such signal ability. The members of the association found many things in his report which, based as they are on a careful and thorough study of toll line operation, will aid them to more fully understand the necessity of devoting careful attention to this all-important subject. The re-election of the entire board of Clearing House officers, without change, was a fitting testimonial to the excellent work they have done in building up this business. The convention was brought to a close Thursday evening by a big banquet at which "Happy Cal" Caldwell, former mayor of Sioux City, was toastmaster.

The menu was arranged to tickle the fancy, as well as the palates of the telephone men, some of the novel items being "cable compound" (green turtle soup), "porcelain knobs" (olives), "automatic iron girls stuffed with phantom circuits" (guess what!). "Dividends" (fancy cakes) were prominent at the banquet, as at the homes of the members. After President Holdoegel had formally thanked Howard S. Baker, president of the Sioux City Telephone Company, for his hospitality, Charles A. Dickson, of Sioux City, spoke on the development attained in his city and the surrounding territory. Among other things Mr. Dickson said, "There is nothing like good, clean competition to bring out substantial results in business of any kind, and the example furnished us by the operation of two telephone companies in this city cannot be equalled. Each company now has upon its books many more subscribers than the Bell company had when we started in business." James H. Shoemaker and J. V. Sammis spoke on topics in a way that made decided hits. J. J. Nate drew on a wealth of good stories accumulated during his long career as a salesman of telephone supplies. G. M. Evanson, of the St. Peter and Nicollet exchange, Minnesota, told an amusing dream at the toastmaster's expense, and complimented the Iowa men on their telephone methods. Judge C. B. Kennedy, Canton, S. D., paid a fine tribute to the telephone girl. Other speeches full of humor or good solid wisdom were made by L. E. Hurtz, Lincoln, Neb.; P. C. Cockerill, and C. H. Smith. The members of the association went home with the feeling that the coming year will bring results which will keep Iowa well in front of the line of successful Independent States.



E. H. Martin, President, E. H. Martin Telephone Company, Webster City.

The Progress of the Iowa Clearing House

By George T. Hewes.

THE Independent Telephone Clearing House records its first annual statement of work actually performed, and its managers are no longer entirely in the dark regarding the advantages of the institution to the Independent telephone cause of Iowa, to the public and to the financial interests of all telephone companies associated with its progress. The first two months, January and February, 1906, were occupied in preparing those companies which were under contract at that time with full details regarding the system of accounting, securing from them information regarding their lines, stations and exchanges.

The first month's business cleared was for the month of March, since which time there has been a gradual increase, as follows:

Amount of business cleared: April over March, 246% increase; May over March, 316% increase; June over March, 352% increase; July over March, 475% increase; August over March, 496% increase; September over March, 555% increase; October over March, 644%.

This gradual increase in the gross amount of toll business cleared is very gratifying and when it is understood that there are 13 companies which have signed contracts for Clearing House service who have not as yet made a report to the office, it will be evident that during the immediate future the percentage of increase each month will continue in a larger ratio than in the past.

From the time of the first month's clearance up to the completion of the prorating of October business the number of employes has not been increased, as the managers have borne in mind the desirability of securing the greatest efficiency at a minimum cost. The point has now been reached where it will be more economical to increase the number of employes and thus shorten the time consumed in completing reports to the several companies of their balances. This will reduce the cost to each company.

As a matter of general information, a report of this character is most easily grasped and understood when the results obtained are recorded in percentages. The actual figures representing clearing house transactions are incorporated in the manager's report to the stockholders of the clearing house.

Forty-three companies have now signed contracts with the clearing house (ten recently). Thirty-three companies have reported details concerning their several systems as follows:

767,549.—Population of the cities and towns whose exchanges and toll stations are reached directly by lines of the Clearing House, not including population within the limits owned by the New State Telephone Company.

135,685 Independent Telephones, including Rural Telephones controlled by members of the Clearing House (not including the telephones owned by the New State Telephone Company).

25,865 Bell Telephones in this same territory covered by Clearing House lines.

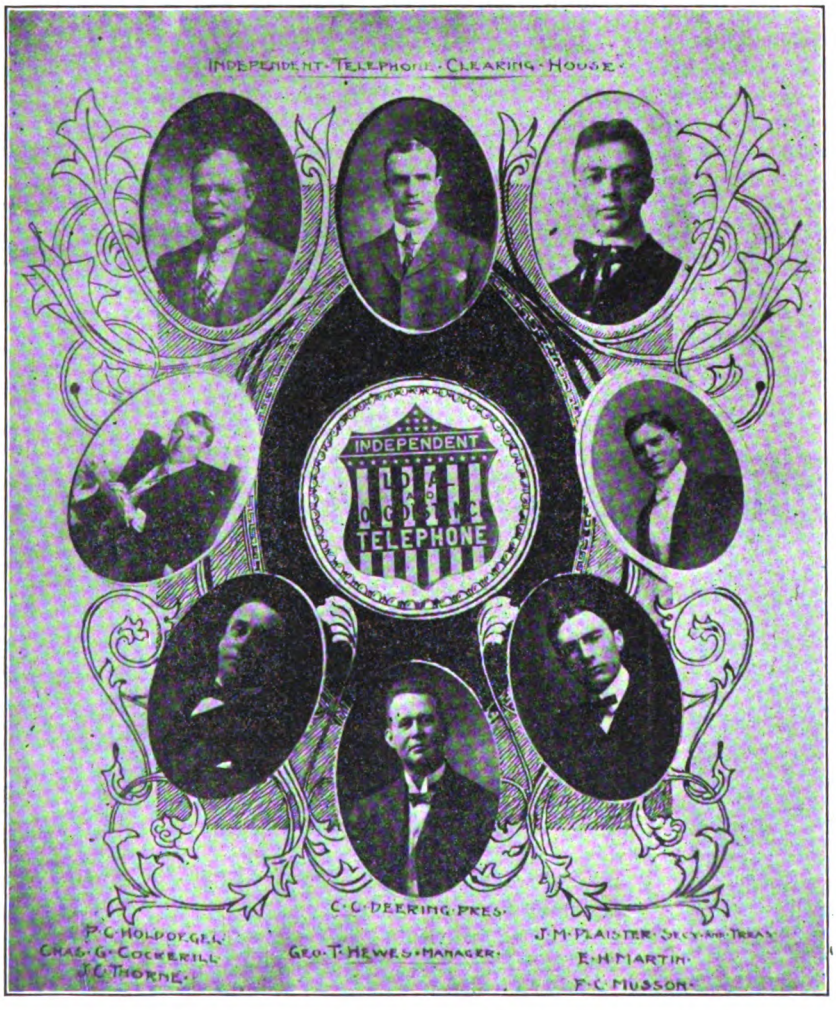
The following number of miles of wire (air line distance) are shown on Clearing House Map No. 9:

Copper, 3,300; iron metallic, 8,862; grounded, 1,796. Total, 13,958.

On account of the circuitous routes between stations the actual number of miles of wire is far in excess of these figures. A line of thought outlined some time ago before many of the members of the Iowa Association may be here repeated as follows:

"An analysis of the toll records of several companies and the determination of the earnings per unit of population has enabled the manager of the Clearing House to determine the extent to which expenditures for the building up of the toll line system can be safely made. The general average of earnings per caput in all of the companies has increased in the last ten years from twenty to fifty cents. In 1903 the lowest average per caput in any company was twenty-four cents, and the highest about one dollar. Except in territories showing the very lowest average, we should not hesitate to make fifty cents per caput the basis for extensions to new points, and for the territory of all companies which show average earnings above the general average we should apply the general average of their particular territory. Experience has shown them that in order to meet the depreciation and maintenance charges in toll lines the gross receipts should amount to at least twenty per cent of the toll line cost. They do not hesitate to recommend the construction of extensions to a toll line system whenever the prospective earnings will amount to twenty per cent of the estimated cost of the extension.

"As an example, consider two towns, each with a population of 10,000, and located twenty miles distant from each other. The cost of the line to connect these towns will be say, $4,000. The anticipated earning per caput is forty cents, this gives a



Officers of the Iowa Independent Telephone Clearing House, Who Have All Been Re-elected for the Coming Year.

*Annual report of the Clearing House, made to the members of the Iowa Independent Telephone Association.

Digitized by Google

gross earning of $800, or twenty per cent of the cost of the line. If these towns were forty miles apart, instead of twenty miles, and the cost $8,000 instead of $4,000, the gross earnings would be only ten per cent of the cost. Such a line might clearly be a bad investment unless the toll line company could rent pin space to farmers' companies at a price which would not only encourage the farmer, but furnish additional telephone subscribers who would increase toll earnings.

"The toll earnings per unit of population should be made the factor in determining the advisability of the construction or extension of toll lines as well as the basis for all computation regarding the toll earning capacity in any locality instead of the amount of earnings per subscriber, for the reason that the percentage of subscribers to population is such a variable quantity.

"The following is a statement of toll conditions in exchanges of a certain company:

"Number of public stations, 57; number of subscribers, 7,440; population, 142,668; outgoing toll receipts, 1 year, $114,060.85; average receipts per caput, $.801. Statement of toll conditions with public stations only—Number of public stations, 27; population, 6,998; outgoing toll receipts, 1 year, $4,005.10; average receipts per caput, $.572.

"Data secured from records in the Clearing House. Agricultural districts—comprehending small towns: Number of public stations, 19; population, 9,349; telephones, exchanges, 1,671; rural, 1,039; total, 2,710; outgoing toll receipts, 1 year, $4,530; average receipts per caput, $.49. Commercial districts—comprehending principal exchanges having competition: Number of public stations, 10; population, 19,925; telephones, exchanges, 2,308; rural, 1,095; total, 3,403; outgoing toll receipts, 1 year, $5,630.40; average receipts of the telephone company in this territory per caput, $.28.

George T. Hewes, Manager of the Clearing House.

"Wherever the amount of toll earnings per subscriber is unusually large, a low percentage development in subscribers is generally found. It is, therefore, very misleading to quote the toll earnings per subscriber as an indication of the development of an exchange. The larger the subscriber development, the larger will be the toll earnings per unit of population, but the smaller per subscriber. It is therefore, believed that the only reliable basis for calculation of earnings upon the toll line investment is the anticipated amount of earnings per caput, i. e., per unit of population. The average toll earnings of any half dozen places in a given territory where the local conditions are the same, rural or commercial, will show approximately the average of the whole territory. Low earnings per caput may indicate any one or all of many unfavorable conditions, among which are lack of toll facilities, poor service, competing toll lines, competing exchanges, etc. The amount of earnings on toll line investment is dependent upon all of these contingencies—added to which are the ratio of mileage of toll line to population and the number of circuits per mile of line.

"It is found, as a general rule, in a territory where cities and towns are situated far apart the receipts per caput are large when compared with a territory where the cities and towns are near together. It is found that the earnings per mile of circuit are greater where cities and towns are near together."

What do these figures signify? They show that the Independents in Iowa have the population, the exchanges and only lack the facilities, to control the toll line long distance business which originates and terminates in Iowa.

It is now up to the Independent telephone men to say whether

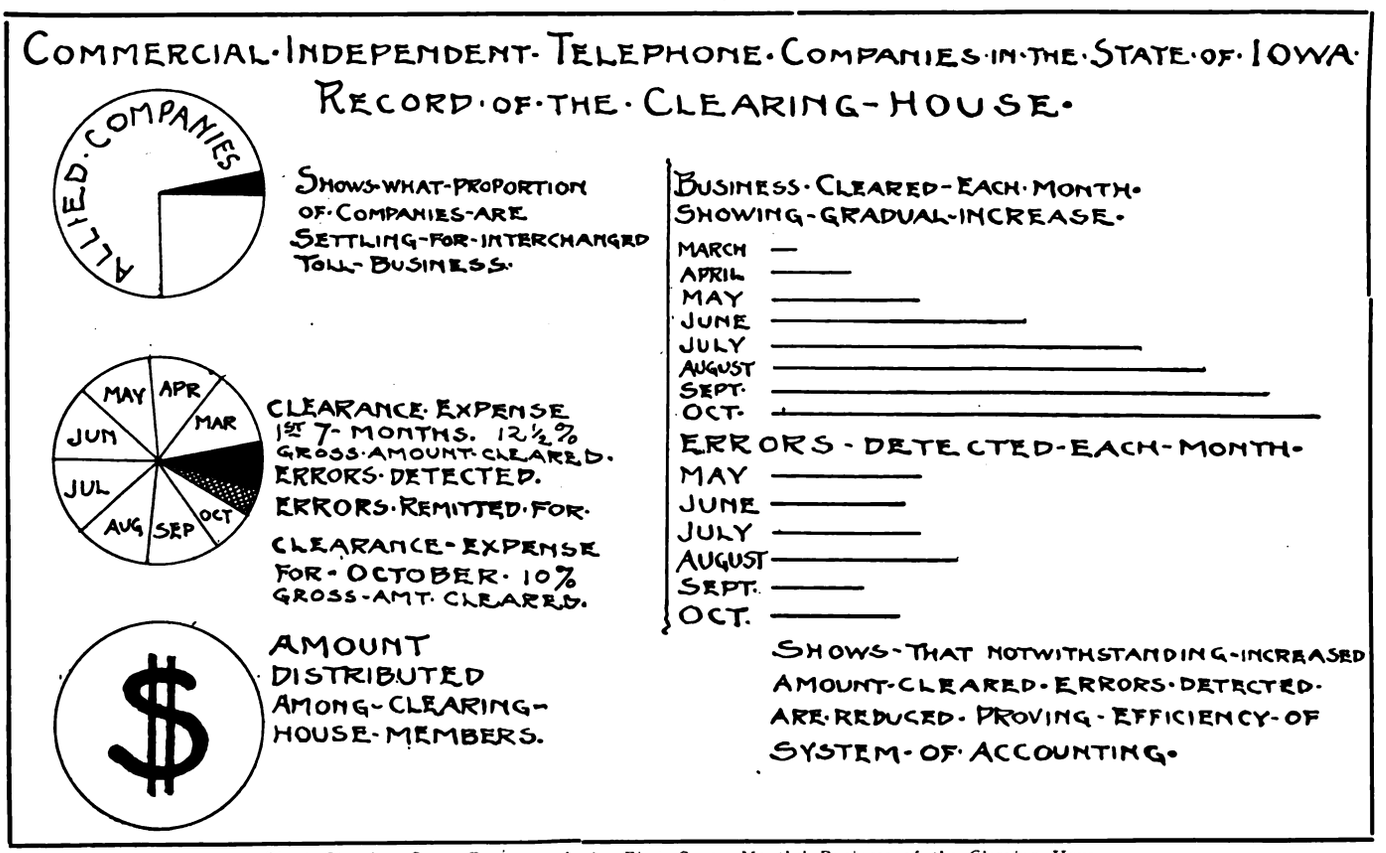


Chart Showing Some Features of the First Seven Months' Business of the Clearing House

Digitized by Google

this volume of business shall be neglected. As before mentioned, a population now within the Clearing House lines of over 767,549, if computed on a basis of 25 cents per caput, means $191,887 per annum, aside from the preservation of present exchange investments, and the recent voluntary cut on long distance toll rates within the first 100 miles indicates that the other telephone company concedes that we have what we claim.

Aesop, in one of his fables, writes of the dog and the shadow. A dog ran along the road with a large piece of meat in his mouth. At last he came to a bridge, and he paused near one side to take a peep at the brook; he saw his shadow, and took it for a live dog. "Ha!" said he, "that dog has a piece of meat twice as large as mine, and I must have it."

But as he snatched at the meat, he saw in the stream, he dropped that which he had in his mouth, and it sank out of reach. He thus lost both; that which he saw in the brook, and his own, which the stream swept far out of sight.

Heretofore, Independents have apparently feared some such danger as this illustrates, and have been disposed not to build toll lines any great distance, as they prefer to exercise jurisdiction over the money collected for tolls, and have even gone so far as to refuse to allow talks and reverse the charges when the call terminated beyond their lines. Now, through the medium of the Clearing House they are just as safe in reversing charges on Clearing House stations as though they had the cash for the call.

The system of cross checking used by the Clearing House possesses several advantages, the most important of which is that it results in a discipline which produces accurate record of all calls on the part of all operators. The fact that errors are discovered quickly and brought home to the operator tends to make them careful. A second advantage is that the error is also brought to the notice of the originating subscriber so quickly that there is little trouble in making collections. All toll accounts are kept up to date and toll bills can be made out promptly. There is no question in the writer's mind but that on a large percentage of their toll bills (especially interchanged business) managers would be willing to discount 15 per cent and even twenty per cent to have them settled, particularly when they are two or three months old after the conversation took place.

In the purchase of standard forms of accounting, the Clearing House is enabled to effect a very material saving to members, purchasing toll tickets in quantities of three million tickets in one order. The prices at which the summary form and check ledger form are secured show a saving to Clearing House companies of at least fifty per cent on their stationery over the prices for small quantities which a single company must pay.

The Clearing House is the institution which not only settles but collects all balances between Clearing House companies and the Traffic Commitee, consisting of C. C. Deering, president; P. C. Holdoegel, vice-president; J. M. Plaister, secretary and treasurer; C. G. Cockerill and E. H. Martin, have recently instructed that all business sent to the Clearing House to be prorated, represented in the Clearing House by toll tickets, shall be prorated beginning with January business. This means that business originating at foreign stations (non-Clearing House stations) going over Clearing House lines shall be prorated. The Clearing House company which switches these messages onto Clearing House lines shall be responsible for the toll charges to other Clearing House companies.

The assessment for clearing and collecting and distributing proceeds for the first seven months was 12½% of the gross amount cleared and the expense for handling October business was 10%. The errors detected were five and three-tenths per cent of the gross amount cleared, of which the managers collected and remitted to the several companies 35% of the errors detected. The 65% of errors detected which was not collected is explained as follows:

Errors in routing by the Clearing House.
Messenger fees not reported by sending station to receiving station.
Failed calls where no talks took place, although the "OUT" ticket may have been marked failed and the "IN" O. K.
Deadhead calls not authorized by Clearing House pass.
Reversed calls not so reported to receiving station.

65% errors detected but not collected for.
35% collected for and remitted.

100%

Telephone Legislation in 1907

A Brief Digest of a Number of Important Acts Which, if Passed, Will Affect Telephone Interests.

THE Legislatures of many States and the Government at Washington have given and are now giving consideration to a great variety of telephone measures. Some of the bills which have been introduced have, of course, been already killed in committee, and action on others is now being considered. In many of the Legislatures, as was to be expected, a number of bills having the same tendency were introduced by different persons. The following summary is intended to give an idea of the important features of nearly all the bills which have been introduced during the present term.

NATIONAL HOUSE OF REPRESENTATIVES.

HOUSE BILL No. 25,708, introduced by Mr. Garber, Feb. 18, 1907, and referred to the Committee on Post Office and Post Roads, provides that if any person shall use an interstate telephone line for the purpose of selling or advertising for sale fraudulent mining stock he shall be guilty of a misdemeanor and liable to punishment by fine or imprisonment.

ARKANSAS.

SENATE BILL No. 138, introduced by Senator DeRossitt, provides that the rate of charges for residence telephones shall not exceed $1.50 per month, while charges for business houses shall not exceed $2.50 per month, with the provision that the bill shall not apply to local exchanges where less than 150 telephones are in use.

CALIFORNIA.

ASSEMBLY BILL No. 492, introduced by Mr. Stanton, Jan. 25, 1907, and referred to Committee on Municipal Corporations, is an act to authorize municipal ownership and operation of telephone systems along with other public utilities which are mentioned.

SENATE BILL No. 558, introduced by Senator Wright, Feb. 1, 1907, and referred to Committee on Judiciary, is an act intended to govern the granting of rights of way over public lands of the State of California for ditches, tunnels and telephone lines which may hereafter be constructed by the authority of the United States for the reclamation of arid lands.

SENATE BILL No. 463, introduced by Senator Carter, Jan. 28, 1907, and referred to Committee on Judiciary, is an act authorizing any incorporated city or town or municipal corporation to own, control and operate a telephone system or other public utilities.

COLORADO.

SENATE BILL No. 283, introduced by Senator Parks, is a bill which provides that telephone companies shall have the right to construct and maintain their lines along the highways and railway rights of way; also that permanent rights of way may be obtained over all public lands upon payment of proper compensation, and compliance with conditions as required by the State Board of Land Commissioners. Other provisions are that a company shall have the power to contract with any person or corporation for rights of way, and shall be entitled to the right of way over the lands and property of any corporations upon making just compensation, and companies vested with the power of eminent domain in order to facilitate the construction of their lines under provisions of the act.

SENATE BILL No. 282, introduced by Senator Parks, is an act to amend the act known as Chapter 125 of the Session Laws of the year 1905, and relates to the granting of franchises. Under the terms of this new bill it is provided that in the event that any Board of Trustees of a town or City Council of a city of the first or second class shall in granting a franchise fail to grant it in the form provided by Chapter 125 of the laws of the year 1905, as above referred to, any taxpayer in the town or city may at any time within thirty days file in the district court a bill in equity seeking for the cancellation of this franchise, and for the issuance of an injunction restraining the grantee from proceeding in the construction of any

Digitized by Google

plant, and that the courts shall have jurisdiction to entertain such a bill and proceed thereon.

HOUSE BILL No. 428, introduced by Mr. Kelly, provides that telephone lines constructed over the line of any steam railway shall be placed on good substantial poles of a size not less than 12 inches in diameter at the bottom and not less than 6 inches at the top, set in earth not less than one-sixth of their length, well tamped, and that double cross-arms shall be used in all cases, with all wires insulated and securely fastened to both cross-arms. Steel pins shall be used in all fastenings, and the cross-arms shall be securely braced; crossing poles shall be set in a straight line with others on either side, and in such a manner that wires shall cross the railroad tracks at a right angle. All crossing poles shall be securely guyed and braced wherever there is a considerable strain, and no span of wires shall exceed 100 feet in length, if possible to keep it within this limit. A separation between wires and the top of rails of 27 feet is required, and from other wires a distance of at least 5 feet must be maintained. Penalty for non-compliance with the act is also related.

SENATE BILL No. 392, introduced by Senator Scott, prohibits the issuing of franks to any person engaged in the collection or distribution of news, and such an act is made a misdemeanor subject to the penalty stated in the act.

SENATE BILL No. 343, introduced by Senator Scott, is an act to prohibit the giving of franks to any public officers of the State, and such an act is made a misdemeanor and punishable by heavy penalties.

IOWA.

HOUSE BILL No. 209, introduced by Mr. McAllister, provides that rural and farm telephone lines which do not charge or receive tolls shall be assessed by the assessors of the several counties in which such lines are located.

HOUSE BILL No. 253, introduced by Representative Geneva, is an act to exempt from taxation farmers' rural mutual telephone lines so long as no dividends or profits are derived therefrom, and amends section 1,304, paragraph 1, of the Supplement of the Code and section 1,328 of the Code.

SENATE BILL No. 145, introduced by Mr. Moon, provides that section 1,610 of the code shall be amended by inserting after the word "associations" the words "and Farmers' Mutual Telephone Associations." This bill relates to the exemption of such associations from the payment of incorporation fees.

ILLINOIS.

HOUSE BILL No. 306, introduced by Mr. Schermerhorn, Feb. 14, 1907, and referred to Committee on Corporations, is an act to limit telephone rates to $60.00 per annum for single party line telephones in cities or villages of more than 100,000 population; $36.00 per annum for single party lines in cities of less than 100,000, and $18.00 per annum for two or more party line telephones, these rates being for business service. The residence rates mentioned are respectively $30.00 for cities of over 100,000 population, and $18.00 for cities of less than 100,000 population, both these applying to single line service; $12.00 per annum in cities of the latter class for two or more party line service.

HOUSE BILL No. 152, introduced by Mr. Gillespie, Jan. 31, 1907, and referred to Committee on Corporations, is an act to provide for the interchange of business between all telephone companies doing business in the State.

KANSAS.

SENATE BILL No. 237, introduced by Senator Stewart, is designed to enable the city of Wichita to construct, own and operate a telephone system for local service and to extend and operate it through Sedgwick County in conjunction with other systems. The necessary action may be commenced when 50 per cent. or more of the electors file petitions with the city clerk requesting the city to purchase or install a telephone system, or this object may be accomplished by the holding of a special election on petition of 10 per cent. of the electors of the city. Other provisions in the bill relate to the manner of carrying out the details of the work, provided the project is undertaken on petition of the electors.

SENATE BILL No. 526, introduced by Sentor Dolley, covers certain restrictions on the employment of telephone operators by railroad companis for work involving the handling of trains.

SENATE BILL No. 329, introduced by Senator Stillings, has for its object to make it unlawful for any person to destroy an insulator used to support a telephone line under a penalty of a fine varying from one to five hundred dollars or imprisonment varying from one hundred days to one year.

MISSOURI.

HOUSE BILL No. 771, introduced by Mr. Hesseltine, provides that in mutual telephone companies each member shall be equally liable for all the expense of the company and no member shall be liable for more than his pro rata share of any expense or damages for which the organization may be liable. The fee for monthly rental which may be charged by such companies is to be limited to $1.50 for residence and $2 for business houses.

HOUSE BILL No. 368, introduced by Mr. Burch, was drawn as an amendment to Section 1259, Article 6, Chapter 12 of the Revised Statutes, making the clause fixing on telephone companies the liability for special damages, occasioned by the failure or negligence of their operators in handling messages, apply to all companies, whether organized in the State of Missouri or in any other State or Territory.

A New Method of Fastening Insulators to Metallic Pins

By Carl Egner, Chief Engineer of the Royal Swedish Telegraph Commissioners.

THE method which is most used at present for fastening an insulator to a metallic support, such as is commonly used in Europe, consists, as is well known, in the support being wound round with black oakum, or the like, after which the insulator is screwed on over the oakum. This latter material does not contribute in the least to the insulation, but, on the contrary, diminishes it in a considerable degree, as filaments of the oakum often hang down and serve to conduct the electric current from the lower part of the insulator to the support. The fixing by means of black oakum demands great practice, as a workman unaccustomed to the work finds it difficult to fasten the insulator properly, in addition to which the insulator easily cracks into pieces if the necessary precaution is not observed.

In the new method of fastening the insulator, invented by the writer of this article and first announced in *The Teknisce Tidskrift*, of Stockholm, the inconveniences just mentioned are obviated, at the same time that certain advantages are obtained.

The essential feature of the new method is the use of *insulating caps*, which consist of extra strong, durable paper impregnated with insulating material. The form of the insulating caps is illustrated in figure 1, and the way in which they are used in figures 2 and 3 which accompany this article.

The insulating caps are placed in the requisite number upon the support, the one upon the other (Fig. 2), and are pressed together somewhat by the hand, so that there will be no great space between the cap and the support. The insulator is then screwed on while simultaneously being pressed against the support. The paper is thus pressed into a small compass, and quite fills the space between the support and the inner, threaded part of the insulator, as is illustrated in Fig. 3, where the support with the insulating-caps is shown after the insulator has been first fastened on and then screwed off. The number of caps which are required is ascertained by trial for each special kind of insulator and support. The thickness of the paper is preferably so chosen that 4 to 5 caps have to be used for each insulator.

It will tend to improve the insulation if, before the insulator is screwed on, there are put on its inner surface some drops of an oil which will not become rancid, such as paraffin oil, which

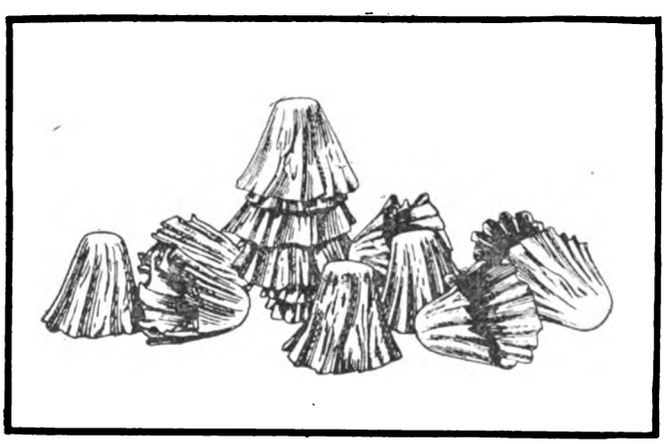

Fig. 1.—Paper caps used in new method of fastening insulators to metallic pins.

can, if desired, be mixed with raw linseed oil. For this purpose a small oil-can may be used.

THE EDITOR'S PAGE

IOWA'S BOOSTERS.

WHEN four hundred and twenty-five telephone men came together at a State convention it means something. They do not spend their time and money for a three days' trip in this way unless an inducement has been offered them which will make their excursion profitable; at any rate not in Iowa. The Indepepndent telephone men of Iowa evidently believed themselves both wise and fortunate in the choice of officers, which they made last year. Ever since these men were elected they have worked with intelligence and vigor in assisting the members in their competitive struggles, and have continuously devoted their best efforts to making the organization more complete, strengthening it, and improving the relations between separate companies. The work of the officers of the association, of the district agents, and finally of the Clearing House, have all contributed powerfully to the unification of a system made up, in the main, of some hundreds of comparatively small organizations. The men in the individual companies have everywhere kept in close touch with general development. The Independent spirit and the State spirit have been strong. The officers of the different companies are now, for the most part, working together, not merely as people who have business interests which are recognized as common to all, but as thoroughly friendly associates.

Good as have been the results in general, the convention itself would not have been the success it was without the final campaign to bring out every man that could get away from his home to attend. The work was begun early and followed up carefully The best men in neighboring States were secured as speakers. Strong men from Iowa's own telephone companies freely gave their time to preparations for the convention, and read papers which stand out with unusual merit. Features which were interesting and useful to the rural line companies were given as much attention as those appealing to the men with larger financial interests.

When the convention assembled the results surpassed even the expectations of the most confident. Every well-known telephone man in the State was present, and there were dozens of new men. Enthusiasm and personal good feeling were everywhere in evidence. As each man registered a badge bearing the number of his registration was handed to him, and this novel plan made it possible for each one to identify his newly made acquaintance. This friendly feeling prevailed throughout the meeting, and constantly became more in evidence throughout the proceedings in the convention hall, at the entertainment given at the theatre, and at the enjoyable banquet which closed the final day.

The officers, who received so fitting a tribute to their efficiency by their re-election as a body, and all the men who shared in the meeting, have gone back determind to put a Shield-bearing telephone in every house and business establishment in the State. Within a year they will have gone far toward accomplishing this. Iowa methods and Iowa push, proved by the showing made at this convention, furnish a remarkable example to every Independent organization in the country.

THE VALUE OF THE ESTIMATE.

SOME days ago a subscriber asked our query department what would be a safe figure for the average cost per line for a telephone system in his town. This question was apparently intended to stand alone on its own merits as there was no information given concerning the amount or character of the population, layout of streets, number of subscribers expected when the system should be first built or at the close of any definite period. Nothing was said which would indicate the class of distribution which could be most suitably employed, no figures which would give a line on the amount of underground conduit work and cable or aerial cable or open wire lines, nothing about the size or type of construction of the building or the immediate or ultimate central office equipment to be installed. Now, under the circumstances, wouldn't any telephone engineer have to confess that he was up against it on a proposition like that?

This case does not stand alone, for it is a fact that in a large number of systems which have been put in, the basis for the rates, in so far as it relates to the cost of the system, has ben assumed on insufficient data. The making out of an exact and detailed estimate is considered either to be not worth while or too difficult to be taken up. The men who are handling the scheme appear to think that there is some special Providence which will make actual costs come somewhere near the figures named after what may be called figuring, but from the inexactness of the methods employed is after all not much better than the wildest guesswork.

Telephone men who are going to install a small system should realize that it is just as important to figure its cost carefully in advance as if they were to build in a large city. In the first place, the entire plan of distribution should be worked out carefully so that it may be known at the start how much material of each class will be required. The amount of labor necessary to install each plant is a variable feature which can only be determined, as a rule, by consultation with an expert, and the benefits of such consultation should be obtained by those who are without the necessary experience to figure these amounts accurately themselves.

This sort of work gives a definite basis for all future projects; it enables those in charge of the plant to finance it on a sound basis and to have definite facts to present to those whose interest they hope to arouse. They can then show that the telephone system, far from being a mysterious thing, is a definite business proposition. The cost of a telephone plant may be figured in advance as closely as that of a building or factory and there is no excuse for the omission of this essential step in the undertaking by the promoters.

Once the estimate is made out and the system ready to be built the estimate becomes available as an aid to the prompt and accurate placing of orders. Only such equipment is ordered as will actually be used and this may be all arranged for at one time so as to derive all the benefits from the savings which may be made by avoiding the placing of numerous small orders to cover one piece of work. The estimate, too, makes it possible to keep a check on the actual construction work so that from the time of the conception of the idea of building the system until the plant is actually working the original estimate is in constant and valuable use.

It is possible to compare the actual costs at the close of the work with those estimated, and the figures which represent whatever differences may exist furnish data which make it possible to figure any new work with greater accuracy than was attained in the first attempt. Small telephone companies and organizations should bear in mind that when engaging in this business they cannot be too careful about making accurate schedules of the things which relate to the cost.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

RIGHT OF VILLAGE BOARD TO FIX RATES IN NEBRASKA.

(1) Our company owned and operated a telephone line along the highway and through the streets of a town before the town was incorporated, and operated a telephone station therein. After the town was incorporated, the company was granted a franchise for five years. Now the franchise being about to expire, the village board says it will not grant a new franchise unless the village board is given the right to fix and regulate rates. Under the circumstances, can the village board cause the telephone poles and lines to be removed if the demands of the village board are not conceded?

(2) Have village boards in Nebraska the right to fix rates?

(3) After rates are agreed upon by the village board and telephone company in consideration of granting the franchise, can the company raise the rates if the agreed rates entail a loss on the company?

(4) Has a village board in fact any authority over a telephone company, or its manner of conducting its business further than the ordinary police regulation relative to the placing of poles and wires?

(5) Three years ago we were granted a franchise in a newly organized village. Subsequently all ordinances, including the telephone ordinance passed at that time, were considered void, as no records were made or kept of the meetings or proceedings; thereupon all ordinances were repassed except the telephone ordinance. Upon a request by our company to re-pass the franchise ordinance, the village board refused to do so unless under certain modifications and restrictions as to rates. We have a copy of the original ordinance as passed and published and have proof of publication. We have established and maintained an exchange in the village underthis ordinance and in every way complied with out part of the contract and our rights have never been questioned. What do you consider is the legal status of our company? P. V. T., Nebraska.

WE will answer your questions in the order in which they are written, the numbers of our answers corresponding to the numbers of your questions:

(1) A telephone company has no right to occupy the streets of a village unless it obtains permission from the village board. This question was recently settled by the Supreme Court of Nebraska in the case of the Nebraska Telephone Company vs. Western Independent Telephone Co., 95 N. W., 18. The suit was for an injunction restraining the defendant from constructing its lines in the streets of Louisville, Neb., in such a way as to interfere with the complainant's occupation of the streets. The chief defense was that the complainant itself was without the right to occupy the streets of the village. The complainant based its right not upon the grant from the village, but solely upon the state law, which gives any incorporated telephone company "the right of way along any of the public roads of the State for the erection of poles and wires." The complainant insisted that the term "public roads" in the section quoted included the streets and highways of the village. The Supreme Court held that this was not a correct contention, and found that the complainant company had no right to use the streets of Louisville for its poles and wires. Under this ruling it would seem that the village board might cause the telephone poles and wires to be removed if its reasonable demands are not met. Whether a demand that the village board should be given the right to fix and regulate rates is reasonable, is another question.

(2) Village boards in Nebraska have no right to fix telephone rates as these are subject to regulation by the State Board of Transportation. Chapter 56, laws of 1897.

(3) After rates are agreed upon as a consideration for the granting of a franchise to use city streets, neither party to the agreement could lawfully raise them. We state this conclusion broadly, but the question has never been decided in Nebraska, and it might be held that the agreement to raise rates would be void owing to the lack of power in the village to establish such regulations. Such a ruling has been made in Ohio. Macklin vs. Home Tel. Co., 240 Ohio Cir. Ct. R., 446. An example of a ruling of contrary effect is found in the case of Mahon vs. Michigan Telephone Co., 93 N. W., 629.

(4) Under the decision, in the above item, it seems that village boards would have authority to refuse to permit the telephone company to enter the village limits with poles and wires.

(5) If your ordinance was validly and legally passed, and you can prove it, you are entitled to use the streets of the village according to its terms, in spite of the fact that no records were made or kept of the proceedings. It is the action of the board and not a record of its proceedings, that gives validity to any transaction.

CONDEMNATION OF PROPERTY IN NEW YORK.

IN a proceeding to condemn a right of way for a telephone line, along the highway, in the State of New York, the petition describing the property sought to be condemned included among other things, "the right to trim such trees as may be necessary to protect said line from interference." The condemnation law commanded that the petition should contain " a specific description of the property to be condemned and its location by metes and bounds with reasonable certainty." The court held that the extent to which such trimming would be required should have been specified and held the petition for condemnation proceedings to be insufficient. Under the code of Civil Proceedure (Section 3360, Subdv. 2). Bell Tel. Co., vs. Parker, 79 N. E., 1008.

COMPANY NOT LIABLE FOR LINEMAN'S DEATH.

THE jury in the case of Joseph P. Donohue, as administrator of the estate of Jeffrey J. Donohue, against the Northwestern Telephone Company, which was tried in the District Court at St. Paul, Minn., returned a verdict for the defendant. The action was brought to recover $5,000 for the benefit of the heirs of the plaintiff. His death, it was claimed, was caused by the defendant's negligence.

The telephone company in 1905 extended its wires through Washington county, passing under the wires of the St. Croix Power Company, which carried a powerful current of electricity from Apple River, Wis. At the point where the wires of the telephone company crossed the wires of the power company it became necessary for the defendant company to reset one of the poles of the power company.

For the purpose of measuring the distance from the power company's line to the ground a lineman named Ripson climbed one of the poles and placed a wire hook attached to the end of a tape line over the wire. Donohue held the other end of the tape on the ground. There were iron strands running through the tape and both Ripson and Donohue were killed instantly by the shock.

The defendant introduced evidence to show that both men disobeyed express commands in attempting to measure in that way. It was contended that the tape line was not furnished for that purpose and that both men were expressly warned and ordered to desist at the time they incurred the risk.

A NEW METHOD OF FASTENING INSULATORS TO METALLIC PINS.

(*Continued from page 208.*)

What is particularly gained by the use of the insulating-caps is an improved insulation. This increase in insulation is derived to a great extent from the fact that the space between the support and the inner mantle of the insulator is always free from

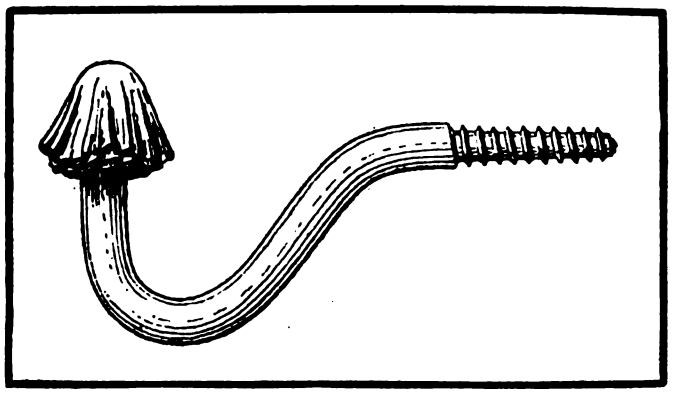

Fig. 2.—Paper caps in place on insulator pin.

filaments liable to become partial conductors when moist, and the like, in contrast to the opposite state of things when black oakum is used. Another cause of the improved insulation is that the insulating-caps cover the support not only at the side but also at the top with a water-tight, insulating mass. Thus a crack in the upper part of the insulator does little or no harm. A large number of experiments have also proved that the insulator can be quite broken off at the top, so that the hole for the support becomes visible, without the insulation being affected in any considerable degree, at least for some time after the accident. This fact is of the greatest importance in all places where the insulators are exposed to damage, and also where insulators are used without having been separately electrically tested, as among such insulators there are occasionally some which have fine cracks extending through them which cause leakage of current in bad weather.

A third and very essential cause of the increase in insulation which is obtained by the use of insulating-caps is that they are impregnated with an oily insulating material. The oily, creased surface of the lowest part of the caps, between the support and the insulator, offers a very great resistance to surface conduction; and as this surface is located at the best protected part within the insulator, it can keep clean and act for a long period. It is clear, however, that by degrees the oil will get dirty by the deposition of dust, etc., and that the insulation will diminish. However, for the reasons mentioned above, the insulation will always be greater than if black oakum is used, and it can easily be increased to its original value by unscrewing the insulator

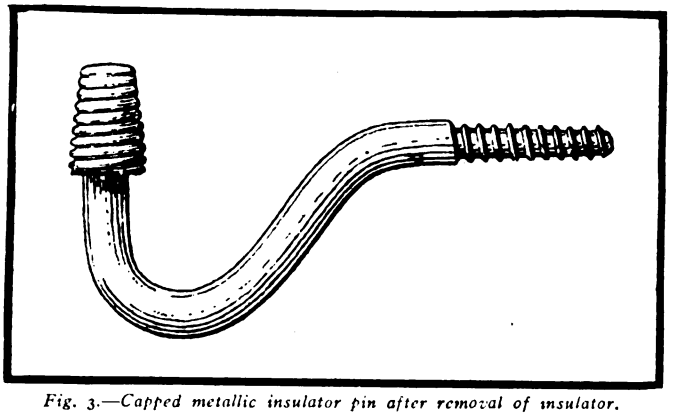

Fig. 3.—Capped metallic insulator pin after removal of insulator.

and putting on new caps; or, if desired, by again soaking the old ones in oil. This would be a most advantageous method of proceeding, especially in the case of important low tension current conductors, as, for example, long telephone lines.

A well known cause which contributes to the deterioration in insulation, always noticed in old lines carrying porcelain insulators, is that spiders and other insects frequent the openings on the underside of the insulators between the mantles and the supports. This inconvenience can probably be remedied to some extent, where insulating-caps are employed, by adding birch-oil or some other substance, the odor of which is avoided by insects, to the material with which the caps are impregnated. This has, however, not been tested in practice.

Insulating caps have other advantages besides the increase in insulation, and the first thing to be noticed is that the mounting of the insulators is greatly facilitated. Experiments have proved that, when insulating-caps are used, the mounting takes only half the time which is required when black oakum is used, while little or no practice is needed to do the work.

In addition to this, insulators with insulating-caps will always be mounted concentrically in respect to the support, for the reason that material in the caps automatically spreads itself equally around the support when the insulators are screwed on. Experience has also proved that breakage of insulators while they are being mounted seldom or never occurs when insulating-caps are used, which means a saving of some importance. Finally, it should be mentioned that the unscrewing of the insulators from the supports is considerably facilitated by this new method of mounting them, a fact of especial importance on some lines where the insulators are much exposed to soot and smoke, and must consequently be taken down to be cleaned.

In order to show in what degree insulating-caps affect insula-

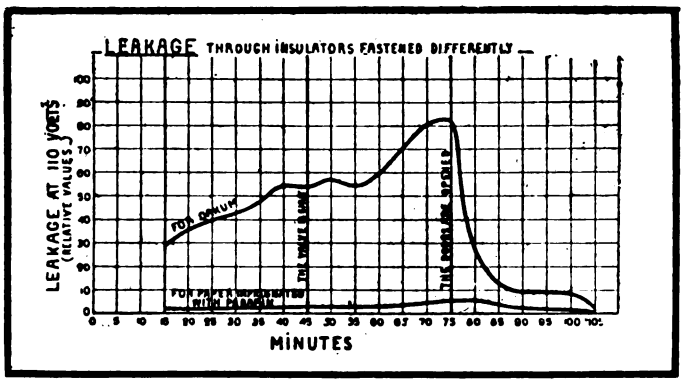

Fig. 4.—Curves showing comparative results of insulation tests with oakum and paraffined paper separation.

tions, diagram (Fig. 4) is shown above, which was prepared by the Material Testing Department of the Royal Technical College of Sweden after comparative trials between insulators fastened with oakum and some insulators fastened with insulator-caps.

The tests were made in a rain-chamber, and the diagram shows the leakage partly during the rain, partly a while after the rain had ceased. From the curves drawn it will be seen that the paper-fastenings gave when the leakage was highest more than 10 times better results than the oakum-fastenings.

REMARKABLE DECISION OF TENNESSEE SUPREME COURT.

TENNESSEE has been witnessing one of the bitterest and longest telephone fights ever known in this country, and it has developed more varied court opinions and peculiar conditions than any controversy of recent years. Nashville, the capital of the State, is the home of the Cumberland Telephone & Telegraph Company, the Bell system, which operates in Tennessee, Kentucky, Mississippi and Louisiana, and naturally the fights brought up in that State get the full benefit of all the tricks and schemes known to the Bell interests.

All these troubles, dating back for several years, have just been aired in the courts of the State and before the State legislature, now in session, and but for the fact that the legislature has just passed a bill providing that telephone companies, as public service corporations, have the right to use the streets and highways of any city or county without the consent of the

Digitized by Google

authorities, the end of the fight would not yet be in sight.

The State Supreme Court added another interesting and entirely new chapter to the telephone history of that State last Saturday by rendering an opinion to the effect that no telephone company had a legal corporate existence in the State, as the legislature had never authorized the organization of such companies. This decision was a part of an opinion dissolving the injunction secured by the Home Telephone Company against the Nashville city council after the Court of Appeals had decided in favor of the company.

Two years ago the Home Telegraph Company, a subsidiary corporation to the Home Telephone Company, applied for a franchise to establish an exchange in Nashville, and was about to get the franchise when all of a sudden the city council made a contract with the Cumberland Telephone Company by which the company was to pay into the city treasury $10,000 per year as long as no other company was given a franchise in that city. This put a stop to all negotiations in the interest of the Home Company, which proceeded to erect poles and construct its lines, claiming this right under the general law of 1878, which permitted electrical companies to construct plants anywhere in the State. The Mayor of Nashville ordered the street forces to cut down the poles of the Home Company, and this order led to an injunction granted against the city by a local judge. The city appealed the case to the circuit court, which dissolved the injunction. In turn the Home Company carried the case to the Court of Appeals, and three weeks ago that court reversed the circuit court and granted the injunction prayed for by the Home Company. The city carried the case on to the Supreme Court, which decided last Saturday that no telephone company had a corporate existence in the State, therefore the Nashville city council had a right to cut the poles and destroy the property of any telephone company at will.

The legal representatives of the Cumberland Telephone & Telegraph Company contended that as a telegraph as well as telephone company the Cumberland's corporate existence was intact and legal. On this point the court said:

"The telephone transmits the human voice; the telegraph does not. But the complicated, burdensome, dangerous character of its structure and fixtures is the feature of the telephone system, which makes it cumbersome upon the streets of the city and makes it necessary that it should be under the control and supervision of the city, whose duty it is to keep the streets safe and to protect the lives and property of its citizens. A telephone company has not more right to occupy the streets under a telegraph charter than a street car company would have under an interurban or commercial railroad charter."

In conclusion the court says: "We pretermit all discussion of the provisions and effect of the act of 1885, and also of the charter of Nashville, since complainant could not at the time the suit was brought, nor at this time, install a telephone plant and do a telephone business under a telegraph charter, and this is its main, if not only, object and purpose."

Fortunately for all telephone interests in Tennessee, the legislature has just passed a bill, which has been signed by the governor, authorizing all telephone companies to construct exchanges and lines in any city or any part of the State, so long as streets and highways are not obstructed, and no city has the authority to interfere with them, as they are public service corporations which cannot be controlled by local laws.

The effect of the Supreme Court's decision in this case would be disastrous to the telephone interests of Tennessee but for the new law, and as it is, will cause no little inconvenience to many companies. Good authorities have held that companies organized before the recent decision may now reincorporate under the new law and avoid all legal complications, but even with this holding many troubles confront the telephone companies of that State.

The mayor and twenty-three members of the Nashville, Tenn., city council are under arrest, charged with contempt of the House of Representatives. During the discussion of the telephone bill which recently passed the legislature, the Speaker of the House, John T. Cunningham, made the assertion that it looked very much as if the Cumberland Telephone Company (Bell) had purchased the Nashville city council outright. At a meeting of the city council soon afterward, a resolution was adopted denouncing Speaker Cunningham as a liar. The speaker took the matter to the House of Representatives, introduced evidence bearing out his opinion in the matter and was sustained by the House. The House then declared the mayor of Nashville and the aldermen who voted for the resolution to be in contempt of the House, and instructed the sergeant-at-arms to arrest them, and bring them before the House for trial on the charge of contempt. Habeas corpus proceedings have thus far prevented the city officials being taken before the House.

A LITTLE GIRL IN INDIANA WHO OPERATES TELEPHONE SWITCHBOARD TO SATISFACTION OF PATRONS.

INDIANA not only claims to be the birthplace of Independent telephony—the first Independent company being said to be the one organized to operate a plant in Noblesville—but also claims to have the most youthful operator on record. This distinction has been won by Orpha Estel Bateman, of Fayette, a prosperous village in Boone County. Orpha is now eight years old, and began work at the switchboard, which is situated in her mother's house, at the age of six. She steps upon a box or sits on a high stool and operates a switchboard to which are connected fifteen lines and seventy-one telephones. Trunk lines also extend to three other exchanges, so that she handles not only local, but a considerable number of toll calls. It is said that the youthful operator rarely ever makes a mistake when making calls.

Miss Orpha Estel Bateman, Indiana's Eight-year-old Operator.

SMALL COMPANIES IN INDIANA REFUSE BELL COMPANY'S OVERTURES AND CONSOLIDATE.

AFTER refusing the many flattering overtures and promises made by agents sent into the field by the Bell company, seven prosperous telephone companies doing business in the western and southern portions of Ripley county, Indiana, have been consolidated under one head. Perry F. Brown, of Napoleon, was made president and general manager of the company representing these consolidated interests. Mr. Brown has already made arrangements for free connection with the Decatur County Telephone Company at Greensburg, and through this arrangement Independent long distance service is obtained for the patrons of the new company. There is much rejoicing over the improved arrangements and the patrons are congratulating each other over the escape from the Bell company.

QUERIES

MOTOR STARTING CONNECTION.—(838).

Will you please explain to me how connections are arranged in a motor starting box of the automatic type so that current only goes through armature when the switch arm is against the magnet, and the arm falls back if the line is interrupted? R. B. C.

In Fig. 838 is shown a simplified diagram of a starting box for a shunt motor. This starting box is what is known as the automatic type. In order to start the motor it is necessary to throw the switch which connects the machine circuit to the power mains, and then to gradually push up the lever *l* over the various studs mounted on the face of the block until the arm is set against the magnet. Armature B is mounted somewhat loosely on the movable arm, so that it can set itself firmly against the pole pieces of the release magnet A.

It will be seen from the circuit of the starting box that as soon as the main switch is closed current passes through the field coils of the motor, and then through release magnet A, and several resistance coils, one of which is joined between each pair of the contact studs in a row set in the starting box. This causes the release magnet to be energized. The arm is then operated, and it will be seen that the stud with which it first makes contact is the one connected to the same side of the power line as the one to which the armature of the motor is attached

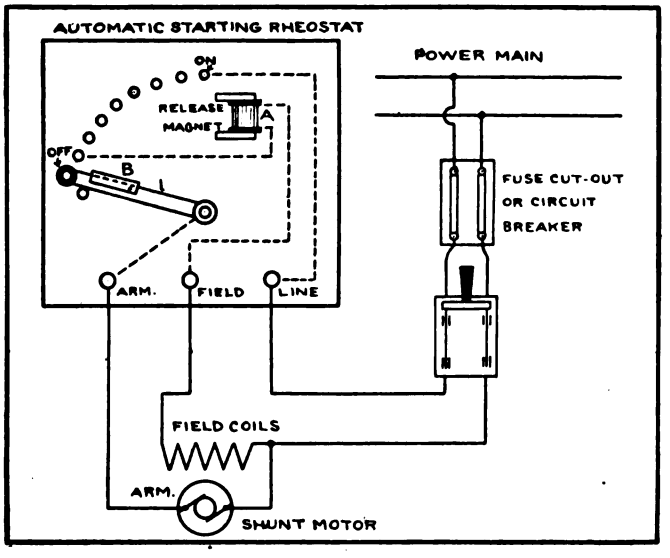

Fig. 838.

through the brushes. Consequently no appreciable current will flow through the armature, although there will be a small amount, owing to the resistance of the release magnet A and the field coils, which in this position of the arm shunt the armature. As the arm is gradually moved toward the "on" position, the amount of current through the armature is gradually increased, owing to the cutting out one by one of the resistance coils which are interposed between the free brush and the side of the line which is connected to the line terminals on the rheostat. When the last stud has been reached the motor is taking the full current for which it is designed. The reason for cutting out the resistance gradually is to give the counter electromotive force time to build up in the armature as if the full current were passed through it before the armature had reached full speed and brought about this action, there would be danger of heating the armature wires to a dangerous point. When the machine is in operation magnet A holds the rotating arm firmly against its pole pieces through its attraction for the armature B. As soon, however, as for any cause the source of supply is interrupted, it will be seen that circuit through the magnet A is interrupted, and the rotating arm, which is controlled by a spring tending to return it to the "off" position, immediately flies back against the stop. This breaks the circuit through the armature, but if, for example, the fuse should be replaced with the switch closed, thus turning power on to the field coil, the armature would be open and would not be subjected to the sudden rush of current which would otherwise be produced.

RUBBING CONTACTS.—(839).

Please explain to me why it is that rubbing contacts seem to be avoided in many parts of telephone apparatus where formerly they were very much used and recommended. B. G. F.

The experience of many telephone companies and manufacturers has been that rubbing contacts do not do what they were formerly supposed to accomplish. The idea was some years ago that the movement of one piece of metal over another would tend to keep both surfaces clean and bright, and in that way a good contact would always be insured between them. At the present time, however, there seem to be good grounds for believing that a considerable number of poor contact troubles occurred in these old rubbing contacts which would never have been brought in if the contacts had been good, clean and bright, and brought together always with a single positive movement. Platinum points are extensively used now, because they do not become corroded, and so there is always a certainty that, unless some solid matter is interposed, good electrical connection will be made when two points are brought together. If you will look over the various pieces of apparatus in which two contacts are brought together, you will find that the two points which are brought in contact do not slide over each other in the apparatus made by most manufacturers.

DUTIES OF A TRAFFIC MANAGER.—(840).

Will you please state in your columns what the duties of a traffic manager are, especially in the larger exchanges? C. B. T.

The duties of a traffic manager vary greatly in different parts of the country. Of course, it is understood that the traffic manager has control of the service and traffic in the entire territory in which the company operates, including all exchanges. To him are responsible, either directly or indirectly, all persons having anything to do with the routeing, operating, service testing or any other special branches of traffic work. His assistants look out for such work as figuring the amount of equipment which is necessary for switchboards and its arrangement at the several positions, the special arrangements for handling the company's business which must be made in the way of equipment for chief operators, information operators, supervisors, etc., in addition to that provided at the regular switchboard.

He also has charge of all matters pertaining directly to operating, such as the routeing of toll messages, and all details of methods of handling toll, local and trunk calls. He endeavors to keep in close touch with the actual amount of business handled, and arrange, in case of circuits between exchanges, for the most economical routeing, and plan such new lines as will probably be necessary sufficiently in advance of the actual requirements to give the construction department time to get the work done.

Service tests are made by special inspectors or by chief operators, and records showing the results of these tests are analyzed, as well as peg counts showing the number and classification of calls, and such action is taken as is necessary to bring the service up to the proper standard and to make a reasonable distribution of the load in the exchange.

Under these general divisions there is a great deal of detail which is handled in various ways by the department under the traffic manager's charge. These details vary greatly in different territories on account of the size of the system, etc.

IN THE OPERATING FIELD

MAKING DIRECTORIES PAY.

ON several occasions we have referred to the large number of advertisements carried in the directory of the Maryland Telephone Company, of Baltimore, Md., and the profit thus derived by the company, not only directly by printing advertisement of other people, but by using its directory as a means of advertising its own service. Not only are the inside pages of the book used for this purpose, but the company has obtained good results by pasting a sticker on the outside of the front cover. The latest book which has been issued carries a slip arranged and worded as follows:

IMPORTANT.

Are you losing telephone calls on account of "Line busy"? A 'phone for in-coming calls only will leave your present one exclusively for out-going service, and insure your receiving all telephone messages intended for you.

Get our rates for this special "In-coming" Service.

TELEPHONES:
Maryland 27 or 28.
Courtland 18.

MARYLAND TELEPHONE CO.,
Traffic Department.

That the company has other effective ways of getting new busibusiness is shown by the constantly increasing size of the directories which it issues.

BELL TELEPHONE COMPANY GETS AFTER FARMERS' LINE BUSINESS WHEN PUSHED BY ILLINOIS INDEPENDENT COMPANY.

AT Highland, Ill., up to a short time ago, the farmers were said to have been practically unable to obtain telephone service on any reasonable terms. Although the Bell company made connections in the thickly settled portion of the town, its charges for building in the rural regions were so heavy that the farmers could not afford to use its lines. The demand for telephone service became so urgent that an Independent company was organized and its lines are now being built.

Fearing the loss of its town business, as well as the opportunity to later acquire the country subscribers on advantageous terms, the Bell organization immediately became very active. The Independent company, however, being organized at a time when dissatisfaction with the company's methods was strong, has an immense advantage and is expected to obtain contracts from nearly the entire community within a short time.

The officers of the Independent company, which goes under the name of the Farmers' and Merchants' Telephone Company, are: Jas. S. Cuming, president; W. R. Lea, general manager, and J. F. Briethaupt, superintendent.

INDIANA INDEPENDENT TELEPHONE MEN MEET AT COLUMBUS.

AT the first quarterly meeting of the Fifth District of the Indiana Independent Telephone Association, held at Columbus, the interest taken and the encouraging reports of progress and increase of business showed the quality of the work which is being done by the representatives of the sixteen companies present. This district includes Bartholomew, Brown, Dearborn, Jackson, Jefferson, Jennings, Ohio, Ripley and Switzerland counties. The progress made by the Independents in this territory is indeed marvelous. A half dozen years ago the Bell company boasted that no Independent company could ever get a foothold in these nine counties. At present the Independents are operating three telephones to each one owned by the Bell.

One of the most interesting features of the meeting was the reading of a paper by Charles S. Norton, of Indianapolis, secretary of the State Association, on "How to Finance Telephone Properties." Mr. Norton's paper brought out numerous facts that the members had desired to know for some time.

One new company was added to the membership roll. W. H McPherson, of Brownstown, was elected president and W. B. Reed, of Seymour, secretary.

CUMBERLAND COMPANY DELAYS COMPLIANCE WITH DEMANDS OF MISSISSIPPI RAILROAD COMMISSION.

GENERAL MANAGER Leland Hume of the Cumberland Telephone Company is still battling with the powers in Mississippi in an effort to stay the execution of orders of the State Railroad Commission to reduce rates in numerous cases and improve service in others. A general complaint seems to exist in that State against the Cumberland company and the commission has demanded that the company shall act in a number of instances. General Manager Hume has just made a tour of the State endeavoring to explain to the complainants that the company will remedy all evils in due time, but did not state when. In the meantime there are coming to the commission every day complaints of the neglect of the company to carry out the orders of the commission.

OLESEN'S KICK.

MISTER Sandusky telefone and companne, Ohio city:

dear sir I receev de tellefone witch I by from you alrite but for why you don't send me no book what is de use of the tellefone when She don't have no book. i am loose to me what kustomer i don't can't call sure ting by no having de book and dats not very pleasure for Me. what is de matter wit you mister Sandusky tellefone and companne. is no my moneys so good like other mans. You loose to me my trade and i am veree angeree for dat and now i tells to you dat you are a dam fools and no good mister Sandusky tellefone companne. You should come at once to-morrow and skrew off the wall your tellefone for shure bekawse you are such a dam foolishness peeples.

Yours respeckfulle,
CHARLEY OLESEN.

P. S.—since i write dis letter i find de book alrite. excuse me.

FIFTEEN INDIANA SUB-LICENSEES SEVER CONNECTION WITH THE BELL LINES.

FIFTEEN rural and co-operative telephone companies in Boone and Hendrick counties, Indiana, operating nearly a thousand telephones, have severed all connections and business relations with the Bell telephone company, of which they formerly were sub-licensees, and returned to the original Independent field. This step is said to be the beginning of a movement upon the part of the several dissatisfied local sub-license companies in Indiana that have been beguiled into business relations with the Bell company. Independent long distance connections will be afforded these companies, so there will be no necessity for them to repeat their unsatisfactory experiences with the Bell service.

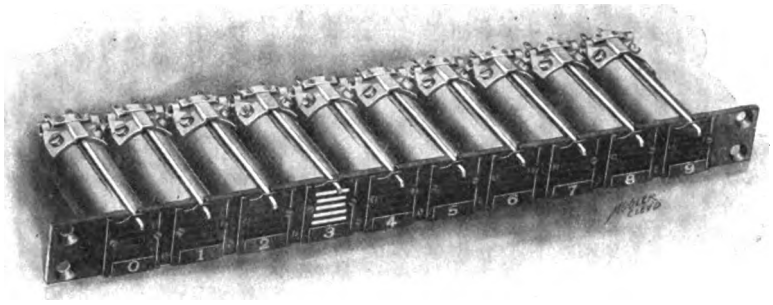
The Problem Solved

A self-restoring signal combining the advantages of a lamp signal with the simplicity and efficiency of North's standard magneto drop.

By its use your present operating force can handle a greater volume of business and at the same time raise the quality of your service to the best.



The signal is electrically self-restoring — this means the elimination of the numerous objectional features of the operator - mechanical - plug - restoring drops. In the first place it permits of mounting the signals and jacks separately, the signals above, so that the cords and plugs will not obscure or interfere with the line signals, and by being mounted apart permits of easy access to all the parts. Furthermore, there is no extra effort required on the part of the operator to force the plug into the jack, nor added mechanical complications and consequent increased wear on plugs and jacks, as in the push-plug restoring types. Being truly self-restoring, this signal can be used on multiple switchboards—a practical impossibility with mechanical-restoring drops.

The signal is identical in construction with North's standard magneto drop, with an auxilliary locking coil and circuit closing device. Instead of a drop shutter, a lift shutter of the gridiron type is used, which, when lifted by the latch displays a white front. Like the standard drop, a tubular shell bored from solid Norway iron rod is used, thus insuring the same effective magnetic circuit. The adjustment is also identical—simple and accurate.

The signal mounts on the same width strip as the standard drop, and can be used in the same switchboard panel with the standard drop.

The operation is simple—when a subscriber rings, the generator current operates the signal—the auxiliary circuit locks it in position firmly. The amount of current required to operate the locking coil is a negligible quantity. When the operator places answering plug in line jack, the locking circuit is opened and the signal restored to normal position.

We claim for this signal—simplicity—efficiency—reliability—flexibility—and excellence of mechanical and electrical design. We know we can substantiate our claims, if you will give us an opportunity to show you. Further, we know you will appreciate what it will do towards improving your service as well as reducing your operating expense.

Let us tell you more about it. Drop us a postal.

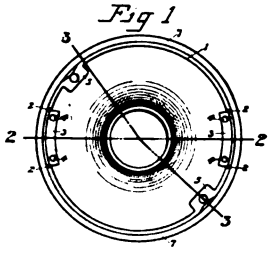
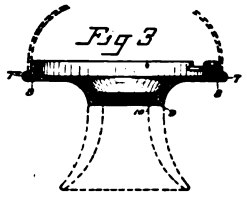
TELEPHONE PATENTS

TRANSMITTER FRONT.

Alfred H. Weiss, Chicago, Ill., patents (No. 847,449; dated March 19, 1907; filed January 2, 1907; serial No. 350,442) and assigns to the Kellogg Switchboard & Supply Company, Chicago, Ill., a transmitter front.

This invention provides for a method of manufacturing a transmitter front which may be pressed from sheet metal. It is originally formed in the shape of a complete ring, and sawed or cut at points 2, after which lugs 3 are bent in to form a support for the bridge, which is secured to these lugs by screws passing through holes 4. Damping spring supports are formed





by lugs 5, which are left upon the otherwise circular stock and are bent back at right angles to the rim. By suitable shaping machines the stock may be folded to form the shoulder 7, against which the enclosing case may rest, and also to provide the necessary thickness of stock for the threads 10 by folding back the sheet upon itself at 9.

SELECTIVE SIGNAL.

Michael H. Degnan, Nashua, N. H., patents (No. 835,704; dated November 13th, 1906; filed February 20th, 1906; serial No. 302,017) a selective signal.

This device consists of a grooved tilting plate mounted on a shaft in engagement with a cam which, on rotation, causes the plate to be tipped to an angle from the horizontal position. The shaft on which the cam is mounted is rotated by a succession of impulses communicated through the action of an electromagnet controlled by pulsating current from the exchange. If the number of impulses is such that the shaft stops when the lower part of the cam engages the stud connected to the plate a ball runs to the foot of the groove in the plate, where it closes a local circuit including a bell and battery. Cams at different stations are set with low points at different angular positions on the shaft, so that at all stations but one the low points pass the shaft quickly, while at the desired instrument the last impulse leaves the low point in engagement with the plate stud.

TELEPHONE SYSTEM.

James H. Gordon, Cooper, Texas, patents (No. 821,482; dated May 22, 1906; filed June 10, 1903; serial No. 160,939) and assigns one-half to James Patterson, Cooper, Texas, telephone system.

The inventor describes apparatus and circuits by means of which he intends that secret conversation may be held between any two instruments upon a party line. A specially arranged hook-switch is used to cut out all stations except those between the two which are talking. This separates the line into sections, to one of which the instruments between which conversation is being held form terminals, while at all the instruments intermediate between these two, receiver hooks are locked in their lower positions. Under these conditions it is obvious that the secondary circuits will be open, and no conversation will be possible. The arrangement for locking the hooks comprises a suitable magnet, operated through a ground connection from a grounded battery which is individual to each instrument and suitably connected to the line for action upon distant stations.

SELECTIVE LOCK-OUT PARTY LINE SYSTEM.

Homer J. Roberts, Evanston, Ill., patents (No. 837,251; dated November 27th, 1906; original application filed September 18th, 1902; serial No. 123,958; divided and this application filed October 1st, 1903; serial No. 175,265) a selective lock-out party line system.

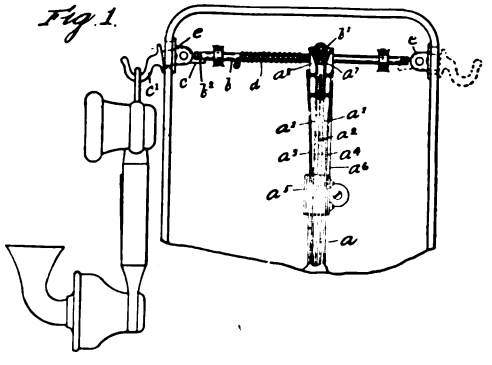
This patent covers a lock-out party line system employing at each subscriber's station three relays, with suitable auxiliary mechanism for controlling the circuits. A special switching arrangement is provided at the central office, in connection with a plug which the operator may insert in the jack connected with any line over which it is necessary that she should have control for the purpose of operating the selective lock-out mechanism at any station.

TELEPHONE SWITCH OPERATING MECHANISM.

Frank M. Potter, Jr., Rome, N. Y., patents (No. 847,367; dated March 19, 1907; filed May 28, 1906; serial No. 319,080) a telephone switch operating mechanism.

This invention covers a telephone hook switch mechanism which can be actuated from either side of the telephone box by a mounted hook.

In the illustration b represents a rock shaft supported by suitable bearings, and extending from side to side of the base which supports the part. Arm b^1 extends radially from the shaft b,



and its enlarged end is adapted to engage actuating springs of the switch a. Arm b^1 works in the slot a^7, which guides it. The spring d is connected to the shaft and to the base, and tends to force the arm b^1 into the slot between the springs a^7 a^8, while this tendency is opposed by the force exerted by the weight of the telephone through lever c. Upon the removal of the telephone the tension of springs causes the shaft b to rotate, effecting the necessary changes in the position of the switch springs.

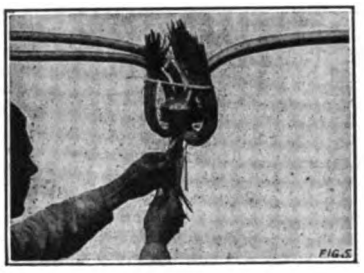
A MONEY SAVER



A MONEY SAVER

YOUR TIME

will earn money in direct proportion to your use of it. The use of the Hargis Cable Splicing Joint will enable you to save time. It will enable your regular linemen to make a better splice than an expert cable man. The picture above shows how easy it is to splice pairs by means of the Hargis Joint. They can all be tied out of the way while the splicing is going on.

The Hargis Joint is not a wiped joint in any sense of the word. The cables are simply put thru the cap and lead gasket and the lead is then poured in until the cup formed by the gasket and the brass cap is full. What wiping is done is simply to smooth off the rough edges, and does not add to the weather-resisting qualities of the joint.

HOW TO SAVE YOUR TIME

Let us send you descriptive matter of the Hargis Cable Splicing Joint shown above. By its use you can make a better splice in less than one half the time it takes to make a horizontal wiped joint, and at the same time you can always get into it by means of special tools to test out for trouble along the line.

It will pay you to write for our descriptive matter.

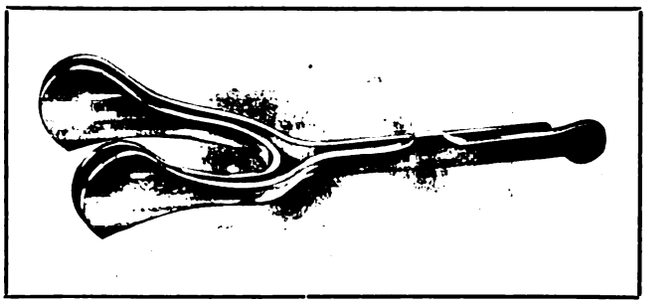
IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

THE DEAN REMOVABLE SWITCH HOOK.

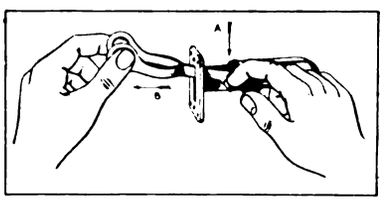
BEFORE refinements of design had been introduced into all the details of telephone apparatus there was no settled common form of switch hook, and many of the faults of operation and a large portion of the troubles in subscribers' instruments were due to bad springs and poor contacts.

The kind of switch hook now most commonly employed upon subscribers' telephone wall sets is known as the long lever hook. In spite of the many improvements in this class of apparatus, it is only recently that the Dean Company has eliminated certain weaknesses of design. For instance, the improvements which are employed in the design of the hook and switch illustrated on this page make it possible to put a hook in a position from the outside of its housings. It is readily removable by hand, and may be taken out when the instrument is to be shipped, so that it is not liable to injury in handling when packed, as it would be if it protruded from the instrument.

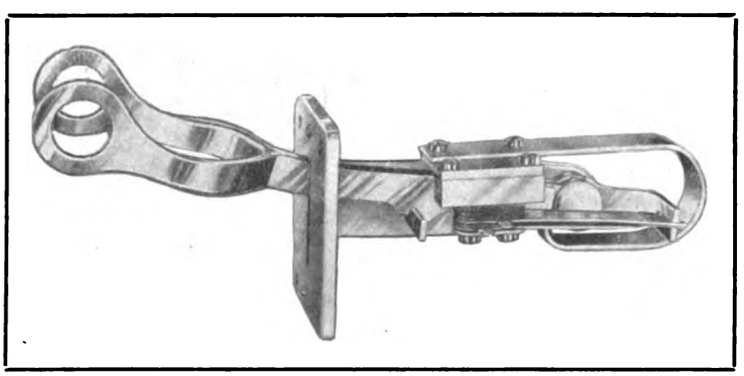


The Dean Hook Lever Blank, Formed of a Single Piece of Sheet Brass.

Although the hook is easily removed and replaced without the use of tools of any kind in the manner shown in one of the accompanying illustrations, it can only be taken out by opening the lid of the telephone box, as the release is located on the body of the switch. No amount of shaking or manipulation from the outside will cause it to become disengaged from its fastenings. All springs make firm contacts and have platinum points. The lever is made from a single piece of heavy sheet brass formed into shape cold, making a very rigid and firm hook designed to stand any ordinary or unusual strain which may be reasonably placed upon it. This is one of the details of design and workmanship which gives to the Dean subscribers' telephone set its high quality. Information concerning telephone instruments will be cheerfully furnished by the Dean Electric Co., Elyria, Ohio, on receipt of a request.



By Releasing the Spring and Pulling on the Hook It May be Withdrawn by Hand.



The Complete Dean Hook Switch, from which the Hook May be Removed Without the Use of Tools.

THE CENTRAL TELEPHONE AND ELECTRIC CO., 2131 Lucas avenue, St. Louis, and 237 Commerce street, Dallas, Tex., is sending out folders giving a special proposition on the Ajax dry battery, which is claimed to give just what telephone men want in the way of high and long maintained voltage with a large current output through its entire life. This battery has been tried out in a large number of exchanges. The company is ready to give prices on trial lots or annual contracts, and will tell what the cell can do to any telephone manager who will write for information.

THE NORTH ELECTRIC COMPANY, Cleveland, O., has brought out a new self-restoring signal, in which it claims to combine the advantages of the lamp signal with the simplicity and efficiency of the standard magneto drop. This signal is electrically self-restoring, and in no way resembles the plug restoring drops which are used in association with jacks. This makes it possible to mount the signals and jacks separately, and do away with any difficulty which may arise from possible interference of cords and plugs with other line signals. The company believes that this signal is a distinct improvement in this line of apparatus, and is sending out full details to all interested persons who write for information.

THE LAKE YALE LUMBER COMPANY is the new name chosen for the corporation formerly known as the Frost Cross Arm and Lumber Mfg. Co.

The headquarters of this company were formerly in Cleveland, Ohio, but are now at Grand Island, Florida, where the mills and timberland also are located. The company makes a specialty of heart specification cross arms of long leaf southern yellow pine. It is in an exceptionally strong position to supply these cross arms either from stock or specifications in all sizes.

The officers of the company are: A. S. Wade, president; I. R. Wade, treasurer; Rene Casters, secretary, and Fred D. Blake, general manager.

THE STROMBERG-CARLSON TELEPHONE MANUFACTURING COMPANY, Rochester, N. Y., reports the receipt of signed contracts up to March 23d, 1907, as follows:

Four sections, 700 additional line equipment, Main Exchange, Seattle, Wash.; two sections, 380 additional line equipment, East Office, Seattle, Wash.; two sections, 300 additional line equipment, Queen Anne Exchange, Seattle, Wash.

Switchboards have been ordered for use at Port Washington, Wis.; Fairport, N. Y.; Louisville, Ky.; Fort Wayne, Ind.; Hammond, Ill.; Magnolia, Ill. Seven central energy P.B.X. switchboards, Seattle, Wash.; Brackenridge, Pa.; Harrisburg, Pa.; Rochester, N. Y.; Leavenworth, Kan.; Minier, Ill.; Eden, Ill.; Goldonda, Ill.; Arcanum, Ohio; Joy, Ill.; Garfield, Ky.

Three generator call switchboards go to Seattle, Wash.; four to Sunnyside, Wash., and others to Pomona, Ill.; Peck, Idaho; Culdesac, Idaho; Des Moines, Ia.; Madison, Wis.; Louisville, Ky.; Des Moines, Ia.

Numerous orders for telephones are also reported aggregating over two thousand instruments.

NEW COMPANIES.

GUYTON, GA.—The Effingham County Telephone Company has been incorporated and the work on its system has been commenced. It is the company's intention to connect with Meldrim and Savannah.

FULTON, ILL.—Articles of incorporation have been filed by the Fulton Telephone Company. It has an authorized capital stock of $2,500, and the incorporators are W. H. Durkee, Robert Ritchie, Garrett Naniga and others.

VERMILION, ILL.—The Stratton Mutual Telephone Company, with a capital stock of $2,500, has been incorporated by Charles Watson, H. M. Huffman and O. J. Rowe.

CORY, IND.—The Perry Telephone Company, capitalized at $5,000, has been incorporated and expects to build and operate a telephone system in Cory and Clay county.

ELLETSVILLE, IND.—The Citizens' Telephone Company has filed articles of incorporation. The capital stock is placed at $2,600, and among the incorporators are F. I. Owens, J. S. Brown, J. H. Matson, J. K. Phillips and T. E. Minet. A telephone plant is to be constructed in Elletsville.

McCUTCHANVILLE, IND.—The Southern Indiana Telephone Company has been incorporated to build and operate a telephone system in McCutchanville and Vanderburg county. It has a capital stock of $10,000, and the directors are Philip H. Kippel, T. H. Umbalk and Daniel Crisp.

PLYMOUTH, IND.—The Patrons' Mutual Telephone Company, of Plymouth, has been incorporated with a capital stock of $50,000, and it is its intention to construct and operate a telephone system in Marshall county.

ELLSWORTH, KAS.—An Independent telephone company has been organized at Ellsworth, and the following officers have been elected: J. M. Reed, president; W. D. Sturgis, vice president; M. L. Amos, secretary; Robert Allan, treasurer.

OAKLAND, KY.—Articles of incorporation have been filed by the Three Forks Telephone Company, of Three Forks, Warren county (P. O. address Oakland). It has an authorized capital stock of $300, and the incorporators are G. W. and E. U. Mottley, of Allen county, and J. H. Souther and J. E. Moulder, of Warren county.

MISSOULA, MONT.—The People's Telephone Company, of Missoula, has filed articles of incorporation. The capital stock is placed at $10,000, and the incorporators are F. M. Taylor, R. D. Prescott, J. A. Moss and W. R. Hamilton, all of Missoula.

ASBURY PARK, N. J.—Owing to the dissatisfaction with the Bell company's service in Asbury Park, the Asbury Park Hotel Keepers' Association, of which M. E. Sexton, George Matthews and others are members, is endeavoring to organize an Independent company.

CEDAR GROVE, N. C.—The Cedar Grove-Egland Telephone Company, with its main office at Cedar Grove, has been incorporated with a capital stock of $10,000. Among the incorporators are J. F. Anderson, M. T. Wilson and others.

LIBERTY, N. C.—An Independent telephone company has been formed to build a telephone system in Liberty, and a long distance line from there to Ramseur. The new company will make connection with the Asheboro Telephone Company.

TAYLORSVILLE, N. C.—The People's Telephone Company, of Taylorsville, has been incorporated to construct and operate a long distance telephone line between Statesville and Taylorsville. J. L. Stevenson has been elected president.

McHENRY, N. D.—The Mutual Telephone Company, of McHenry, has been organized.

SPRATT, O.—The Muskingum County Farmers' Telephone Company, of Spratt, has filed articles of incorporation. It has a capital stock of $10,000, and J. T. Elliott, W. T. Blackstone, S. S. Neff and C. W. Elliott are among the incorporators.

HOOKER, OKLA.—The Hooker Telephone Company, Hooker, Okla., with a capital stock of $20,000, has been incorporated by N. O. Stephenson and others.

BRISTOL, TENN.—The Boone's Creek Telephone Company has been organized and has built part of its system.

DRESDEN, TENN.—The Weakley County Rural Telephone Company is being organized. Lines are to be built to Latham, Dukedom, Palmerville and Fulton, Ky., and connect with the rural lines there. The headquarters are to be at Dresden.

MUNFORD, TENN.—An Independent telephone company has been organized at Munford and the following are among the incorporators: J. B. Witherington, E. H. Wooten, P. W. Lanier, S. H. Bass, W. M. Abernathy, E. W. Starnes and others.

BRIGGSVILLE, WIS.—Articles of incorporation have been filed by the Briggsville & Big Springs Telephone Company, of Briggsville. It has an authorized capital of $2,000 and the incorporators are F. J. Kimball, A. L. McDonald and W. C. Kimball.

NOYAN, QUEBEC, CAN.—An Independent telephone company, to be known as the Citizens' Telephone Company, has been organized at Noyan.

FRANCHISES.

DOWNEY, CAL.—The Downey Home Telephone & Telegraph Company has been granted a franchise to operate a telephone and telegraph business in Norwalk, Downey and Los Nietos.

ANTHON, IA.—The Farmers' and Business Men's Telephone Company, of Oto, has applied for a telephone franchise at Anthon.

LA GRANGE, MO.—The Mississippi Valley Telephone Company has been granted franchises by the cities of La Grange and Canton.

DEXTER, ORE.—The Dexter Telephone Company has applied for a franchise to extend its lines from Dexter to Springfield.

SPRINGFIELD, ORE.—Application has been made by the McKenzie Telephone Company to construct a line from Springfield to Leaburg.

FINANCIAL.

BIRMINGHAM, ALA.—The People's Home Telephone Company has increased its capital stock from $200,000 to $300,000.

PELICAN RAPIDS, MINN.—A dividend of 10 per cent. has been declared by the Pelican Telephone Company.

KANSAS CITY, MO.—The directors of the Kansas City Home Telephone Company have increased the regular quarterly dividend from 1¼ to 1½ per cent., thus placing it on a basis of 6 per cent. per annum.

HARTINGTON, NEB.—The Cedar County Telephone Company has declared a dividend of 8 per cent.

HIGH POINT, N. C.—A 10 per cent. dividend has been declared by the North State Telephone Company.

BUCYRUS, O.—The Bucyrus Telephone Company has increased its capital stock from $65,000 to $100,000.

COMBINATIONS.

CHERRY VALLEY, N. Y.—The controlling interest in the Cooperstown, Cherry Valley & Sharon Spa Telephone Company has been acquired by H. P. McDonough, manager of the Otsego Home Telephone Company, and Henry Rathbone, manager of the East Springfield Telephone Company. Mr. McDonough has been elected general manager, and Mr. Rathbone, superintendent. Arrangements are being made by the new owners to extend the line to Sharon Spa.

ELECTIONS.

TEHERAN, ILL.—The Teheran Telephone Company has elected the following officers: Mr. Benham, president; Mr. Aldrich, secretary and treasurer.

ELIZABETH, IND.—At a recent meeting the Harrison County Telephone Company elected the following officers: President, P. J. Blonk; vice president, J. Zollman; treasurer, C. Treese; secretary, E. Smith.

NEW CAMBRIA, KAN.—The following officers have been elected by the New Cambria Telephone Company: Frank Knittle, president; Wm.

NEWS—WANTED

THE matter contained upon the message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

Contents

Telephone Instruments, Telephone Lines, Telephone Exchange, Telephone Operation, Automatic Telephone, Wireless Telephony, Magnetism, Measurements, Wiring, Telegraphy, Direct Current Dynamos and Motors, Electric Lighting, Railway Power and Lighting, Arc Lamp Development, Electrical Construction, Management of Dynamos and Motors, Power Station, Alternating Curren Machinery, Power Transmission.

FOR TELEPHONE MEN and ELECTRICIANS

This Cyclopedia contains more information on electricity and telephony than any other work published. It thoroughly explains all the duties of the manager, lineman, switch board and troubleman. It not only fully explains the entire operation of a working telephone system, but it tells how to construct such a system. Treats fully on the Automatic Telephone and Wireless Telephony. Filled with information on electricity in all its forms—undoubtedly the best set of books for the telephone man who wishes to secure a fine position and a large salary.

Cyclopedia of Applied Electricity

Five large volumes—2,500 pages,—2,000 full page plates,—size of books 7 x 10 inches; —bound in red morocco, fully indexed, Diagrams, Descriptions, Formulae, Sections, Tables —supplemented by practical test questions—prepared especially for practical men who have no knowledge of advanced mathematics.

Regular Price $30.00—Special 30 Days $19.80

Free for Inspection

Sent, express prepaid, for five days' FREE examination if you mention **American Telephone Journal.** Pay $2.00 cash and $2.00 a month thereafter until you have paid $19.80, if you keep the books. We send for them, at our expense, if they do not meet your needs. The only reason this set is offered at such a low price is to acquaint the public with the superior instruction of the American School of Correspondence—these books being partly compiled from the instruction papers.

WHITE BEAR LAKE, MINN.—The following are the directors for the White Bear Lake Telephone Company: B. M. Teesem, Ole Ronnie, Hans Gerder, O. Baukol, C. Lingen, P. W. Sylvester and Andrew Anderson.

BEATRICE, NEB.—The German Mutual Telephone Company has elected H. Harms, president; F. Saeckel, secretary; David Bassing, treasurer.

LEBANON, N. J.—At the fourth annual meeting of the Lebanon Telephone Company the following officers and directors were elected: President, S. J. Shurts; vice-president, Geo. Clark; secretary, O. A. Farley; treasurer and manager, E. W. Sutton; directors, S. J. Shurts, H. H. Miller, J. E. Ramsey, George Clark, J. C. Farley, E. W. Sutton and O. A. Farley.

SAVANNAH, N. Y.—The following officers have been elected by the Savannah Telephone Company: President, E. P. Brown; vice president, Perry Morgan; secretary and treasurer, C. A. Coleman.

TONTOGANY, O.—The Tontogany Telephone Company, at a recent meeting, elected the following officers and directors: President, W. H. Hannah; vice president, Jacob Huffman; directors, Henry Hubner, Thomas Falsted and John Wenig.

PERSONAL.

B. H. BROOKS has recently gone to Detroit, Mich., to accept the position of chief engineer of the Electric Construction Company of St. Louis, Mo., in charge of the work of constructing and installing the new plant of the Home Telephone Company. After remaining in Dayton two years he went which the Interstate Telephone Company will operate.

Mr. Brooks during the past six years has been engaged as engineer on a variety of important work, having been in 1901 chief engineer of the Cuyahoga Telephone Company of Cleveland, from which place he went to Dayton, Ohio, to take charge of the construction of the plant of the Home Telephone Company. After remaining in Dayton two years he went to Columbus, Ohio, in March, 1904, as chief engineer of the plant of the Columbus Citizens' Telephone Company. At this place extensive additions to the cable plant, removal of the exchange from the old to the new building, and the cutting over from the manual to the automatic service took place under his direction. He left Columbus to take his present position in charge of the work at Detroit.

New Construction in the Field

BERKELEY, CAL.—The Home Telephone Company, which was recently granted a franchise at this city, is to begin the construction of its system.

POMONA, CAL.—Lines are being constructed by the Pomona Valley Telegraph & Telephone Company to Claremont, Chino and other places. Its system is also to be extended to San Dimas.

COEUR D'ALENE, IDAHO.—It is the intention of the Interstate Telephone Company to expend $30,000 in improving its system in this city.

NAMPA, IDAHO.—The Independent Telephone Company, of Boise, is extending its lines to Nampa, Caldwell, Payette, Weiser and Emmett.

AURORA, ILL.—A telephone line from Aurora to St. Paul is being constructed by the Chicago, Burlington and Quincy Railroad Company.

CAIRO, ILL.—A line from Thebes to Willard is being erected by the Thebes and Cairo Telephone Company.

LEXINGTON, ILL.—The Home Telephone Company contemplates the erection of additional lines to Hudson.

PEKIN, ILL.—The Citizens Telephone Company is overhauling its lines in Pekin.

BIPPUS, IND.—It is the intention of the Bippus Telephone Company to greatly enlarge its plant.

MADISON, IND.—The Madison Telephone Company is planning many improvements to its system.

BELLEVUE, IOWA.—It is the intention of the Bellevue Telephone Company to make many improvements in its plant.

DES MOINES, IOWA.—A new switchboard is to be installed by the Mutual Telephone Company in its east side exchange. Many other improvements and extensions in its system are also planned.

MT. PLEASANT, IOWA.—The lines of the Mt. Pleasant Telephone Company are being extended.

NORTH LIBERTY, IOWA.—The North Liberty Telephone Company is considering the advisability of building a line to Tigin.

STORY CITY, IA.—The Story City Telephone Company has installed a new switchboard and is making many other improvements in its system.

GARDEN CITY, KAN.—The Garden City Light, Telephone and Manufacturing Company is planning to extend its lines into Colorado, and it is estimated that between $20,000 and $30,000 will be spent on the contemplated improvements.

HOMESTEAD, KAS.—The lines of the Rural Telephone Company are to be extended to Burns.

FREDERICK, MD.—The Frederick County Telephone Company contemplates the establishment of an entire new exchange in the building it has recently purchased at Frederick.

ONTONAGON, MICH.—The Ontonagon Telephone Company expects to construct lines to Rockland.

JOPLIN, MO.—The plant of the Home Telephone Company, at Joplin, is being considerably enlarged.

SPEED, MO.—A number of new lines are to be constructed by the Speed Telephone Company.

HEMINGFORD, NEB.—A new exchange building is shortly to be erected by the Hemingford Telephone Company.

CHERRYVILLE, N. C.—The lines of the Piedmont Telephone and Telegraph Company are being rebuilt from Cherryville to Falston and Belwood The Bessemer City line is also to be improved.

CAMPBELL, N. Y.—A new line through Curtis Hollow is among the extensions planned by the Campbell and Risingville Telephone Company.

LITCHVILLE, N. D.—It is the intention of the Litchville Rural Telephone Company to extend its lines from Litchville and Marion into Stutsman and LaMoure counties.

ARCANUM, O.—The Home Telephone Company plans the installation of a new switchboard and many other improvements in its system.

ASHLAND, OHIO.—About $50,000 is to be expended by the Star Telephone Company in improving its system.

DAYTON, OHIO.—It is the intention of the Home Telephone Company, of Dayton, to expend about $200,000 in enlarging its plant.

LISBON, O.—The long distance lines of the United States Telephone Company out of Lisbon are to be rebuilt.

NEWARK, O.—Much new construction work is planned by the Newark Telephone Company.

NORWICH, OHIO.—Many new lines are being built by the Norwich Mutual Telephone Company.

BENTON, PA.—A new switchboard is to be installed by the Benton Rural Telephone Company.

BIRDSBORO, PA.—It is the intention of the Conestoga Telephone & Telegraph Company to construct another line to Birdsboro. It will start from Geigertown and run via Culptown.

CARLISLE, S. C.—The plant of the Carlisle Telephone Company is being greatly enlarged and improved.

LEWISBURG, TENN.—A new exchange building is to be erected by the Cornersville Telephone Company to take care of its increasing business.

LYNNVILE, TENN.—The Home Telephone Company, now building a trunk line from Louisville to New Orleans, has begun work on a line to Lynnville, Tenn., and will put in an exchange there. The poles are up from the junction of the through line at Waco to Lynnville, three miles.

BIG SPRINGS, TEXAS.—The Western Telephone Company has under construction a line from Big Springs to Merkel.

RUTLAND, VT.—The Vermont Home Telephone Company, which has acquired the franchise of the Home Telephone Company, is to install an exchange at Rutland.

OAKFIELD, WIS.—Lines are to be built in Oakfield by the Lamartine and Rock River Telephone Company.

SUNNYSIDE, WASH.—Improvements in its system are being made by the Yakima Valley Telephone Company.

KENOSHA, WIS.—It is the intention of the Independent Telephone Company at Kenosha to build additional lines and otherwise improve its system.

RIPON, WIS.—The Ripon Mutual Telephone Company, recently incorporated with a capital stock of $10,000, is to not only build lines in Ripon, but lines will also be built in all directions from the city into the surrounding country.

LARAMIE, WYO.—R. D. Stewart contemplates the erection of a telephone line from Laramie Plains and Centennial.

BARRIE, ONT., CAN.—The council has asked the Ontario government for information regarding the construction of a municipal telephone system. Address J. H. Bennett, Mayor.

EMO, ONT., CAN.—The plant of the Rainy River International Telephone Company is to be completely overhauled at Emo.

SOUTHWOLD, ONT., CAN.—New lines are being built by the Southwold & Dunwich Telephone Company.

JUST A SUGGESTION

Take one of your busy 4-party lines and equip it with "POOLE" Lock-Outs. Leave it in service a month and then see how many of the four will stand a raise of $3.00 a year rather than go back to the old way. We know the answer, but we want your subscribers to impress on you the fact that the "POOLE" Lock-Out is a rate-raiser.

It won't cost you anything to try it, because we will loan you the Lock-Outs free and there is no other equipment required. Write today for our Booklet AL-2.

DEAN TELEPHONE APPARATUS

The Vital Parts of Telephone Equipment

Transmitters and Receivers

The talking and receiving parts of the telephone are its life blood. All other parts of telephone equipment are for convenience of switching and calling.

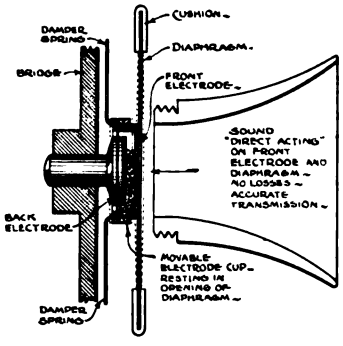

Diagram of Working Parts of Dean Transmitter.

The Dean Transmitter

This transmitter withstands climatic conditions and severe service tests. It is constructed to receive the sound waves direct on its front electrode. This direct action gives rise to a delicate and accurate action in the resistance chamber which cannot be had in an instrument having an intervening diaphragm or massive electrode holder. Direct vibration gives quality and penetrating power of transmission. Every part is perfectly made and all transmitters are thoroughly tested before leaving the Dean factory.

The Dean Receiver

Our receivers freely respond to the feeble incoming transmission from the longest lines and faithfully reproduce all the finer and individual qualities of speech. The interchangeable construction and permanent adjustment render Dean receivers absolutely uniform. The retaining case serves only as a finishing cover for the working parts. If the case should be removed or entirely broken away the receiver can still be operated until the broken case is replaced by a new one. Dean receivers hold their magnetism. Many otherwise good receivers soon demagnetize, making them almost useless as a receiving instrument.

Write us today about this equipment and we will mail you free bulletins.

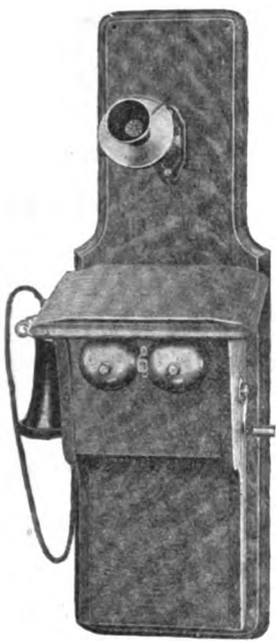
BRIDGING TELEPHONES



CENTRAL ENERGY STYLE.

If each of our successful and satisfied customers wrote you a strong letter, telling why they believe Stromberg-Carlson Bridging Telephones the best, you would give their views serious thought.

If every last one of them made the same recommendations you would be greatly impressed.

If each particular man told you he used Stromberg-Carlson telephones because he was satisfied with the results—service—you would be convinced that their unanimity of opinion was not a coincidence but a bit of information worth money to you.

If we can serve you and earn your endorsement we will have accomplished something—order your bridging telephones from us and give us the opportunity to earn it.

ANALYSIS OF "STROMBERG-CARLSON" CONSTRUCTION

TRANSMITTER: A perfectly constructed and efficient instrument equally serviceable over short and long distance circuits.

TRANSMITTER ARM: All parts of cold drawn steel, including the base. Indestructible and adjustable.

RECEIVER: The acknowledged standard for any kind of telephone service. Receiving qualities well defined and distinct.

RECEIVER CORDS: Standard Braided copper tinsel insulation with braided cotton and green spun machine silk used for each individual conductor, and green silk external covering. All Stromberg-Carlson telephones are equipped with silk instead of worsted or cotton cords.

INDUCTION COIL: First in order of merit when receiving or transmitting. Particularly superior in articulation when transmitting on long lines.

INDUCTION COIL MOUNTING: Simple self-fastening mounting, permitting coil to be removed at will without use of screw-driver.

GENERATOR: High voltage—efficient—perfectly designed generator with laminated carefully wound armature. Good steel used, assuring greatest permeability.

RINGER: Superior design of adjustable feature, improved form of spool construction to eliminate any chance of corrosion of winding. SPUN BRASS heavily nickel plated gongs, NOT SHEET IRON GONGS. Hexagon gong nuts that can be made fast without disfiguring appearance.

SWITCHHOOK: Its points of merit are—simplicity, good mechanical construction, positiveness in action.

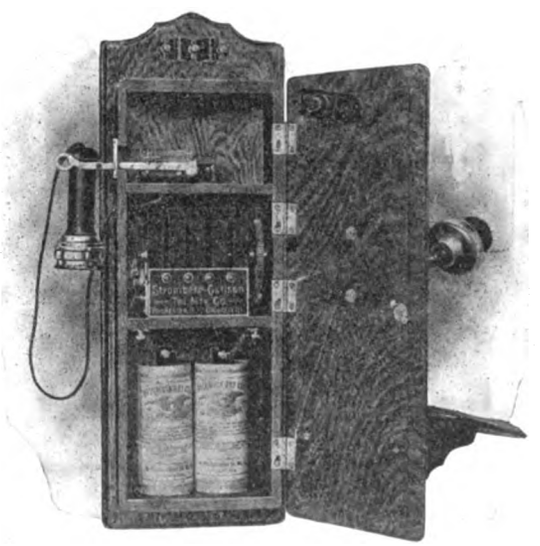
WOODWORK: The cabinet is made of selected quarter sawed oak, well seasoned and kiln dried, tongued, grooved, and glued at the corners. Each cabinet is sanded to a smooth surface and finished. First, it is given a coat of golden oak stain, next a coat of golden oak filler, then one of white shellac, and afterwards two coats of rubbing varnish, which gives a finish better than two-thirds of the furniture on the market.

WIRING: Tinned copper wire used entirely. All wiring through backboard EMBEDDED BELOW SURFACE IN GROOVES AND FILLED OVER WITH BEESWAX. Each leg of circuit wiring terminated on metal terminal or binding post.

ARRESTER: Line wire binding posts and carbon arrester combined. Carbon protected from dust and can be renewed without difficulty when fused.

LOCK: Improved spring screw lock with metal seat for screw securely fastened with two long screws.

TRIMMINGS: Improvements such as metal bushings in backboard for mounting screw, guard over clapper rod, nickel dipped spring hinges with soldered connections and milled hexagon binding post are important points denoting best telephone practice in manufacture.



COMPACT TYPE.

We will furnish standard bridging telephones with four and five bar generators with ringers of either 1,000 ohms, 1,600 ohms and 2,000 ohms in two forms: the Compact Wall type and the Central Energy Style Wall Telephone.

Stromberg-Carlson Telephones fill every telephone requirement, absolutely irrespective of name, price or form.

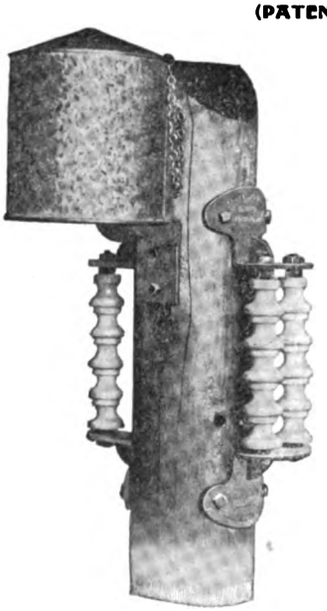
ROBINSON DISTRIBUTION RACK

(PATENTED)



This cut shows the ROBINSON RACK as used in connection with Can Top. Its extreme flexibility makes the Robinson Rack a most desirable method for distribution. No waste of insulation. Costs 50 per cent less than circle top. Easy to trace circuits. Can distribute five pairs from one side of pole; ten pairs from opposite side. Notice special drip feature.

Let us send you circulars and prices.

MANUFACTURED BY
The W. G. Nagel Electric Co.
26-30 ST. CLAIR ST., TOLEDO, OHIO

AS AN INVESTMENT

there's nothing more safe, more sure, more profitable—in the telephone business—than the securities of an Independent telephone company operating our AUTOMATIC TELEPHONE SYSTEM—

BECAUSE it gives more service, better service, prompter service, more accurate service than a manual system (and also an absolutely secret service, which no manual system can give) and

BECAUSE it costs less to operate, less to maintain, less to enlarge than a manual system, or

TO SUM IT ALL UP, the AUTOMATIC TELEPHONE SYSTEM produces a better telephone service, commanding a higher price, at less cost than inferior service can be produced for by a manual system.

THAT IS THE REASON WHY the AUTOMATIC TELEPHONE SYSTEM makes the securities of the company using it safe, stable and profitable, and why it has been adopted by the Independent telephone companies in the following cities:

Aberdeen, S. D.
Akron, Ohio.
Allentown, Pa.
Auburn, Me.
Auburn, N. Y.
Battle Creek, Mich.
Beaver Falls, Pa.
Bellingham, Wash.

Talks With The Buyer—No. 6

I want to digress from my "Talks" on our telephone apparatus and its particular adaptability to your requirements long enough to call your attention to another of our special price offerings.

We had designed and made for us a very large number of especially attractive

New Pay Station Signs

These signs are beautifully enameled on heavy gauge steel in red, white and blue lasting colors. The design appears on both sides. Flanged for support. These signs have been adopted by the International Telephone Association. They are better than any other sign which has ever been offered the telephone trade, both in the quality of the sign and the fact that on the 18 x 19½ size the words "Telephone Pay Station" appears; not shown on any other such sign. I wish it were possible for me to show you here a cut of the three-color signs, but I am mailing you illustrations direct, and assure you that they are especially seasonable offering at the following prices:

No. 10—18 x 19½ size.		No. 12—8 x 18 size.	
Lots of 5	$1.00	Lots of 5	$0.65
" " 15	.90	" " 15	.60
" " 25	.85	" " 25	.54
" " 50	.80	" " 50	.50
" " 100	.70	" " 100	.45

The signs on which I am quoting must not be confused with the cheaper signs frequently offered the telephone trade. This is the time of year to put out your signs. Send us your orders for immediate shipment. Delivery F. O. B. St. Louis, Dallas or Chicago.

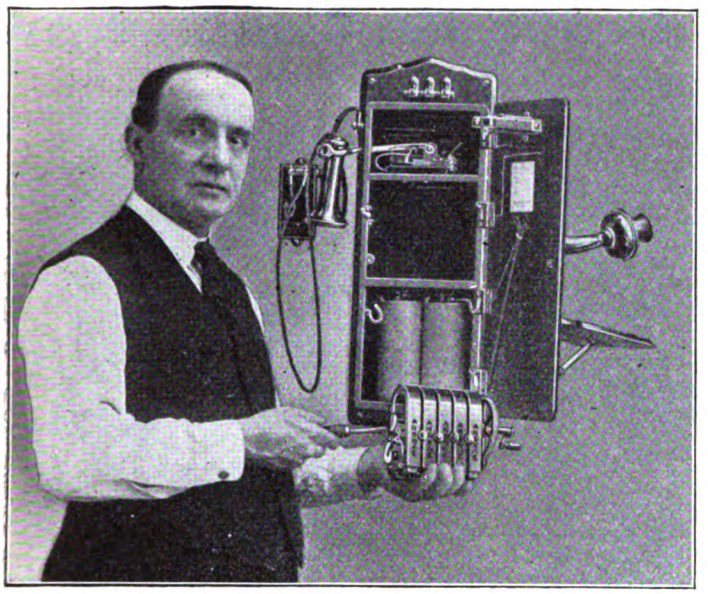
ANDRAE



No Trick At All.

Talks With the Trouble Man

Did you ever examine 10 or 12 generators, each of different make, that have seen 4 or 5 years' service?

At first glance they will look very much alike, but on closer inspection you will discover much difference in their mechanical construction. Some will run perfectly true. Every part will be firmly and substantially in position, and the generator will have a business-like appearance throughout. Others will be weak, wabbly and dilapidated.

Some will show practically no magnetism. This means cheap magnet steel. Others give very feeble current, due to errors in construction, poor contacts on the shunt springs, worn-out insulation or any one of a number of defects.

If one of these instruments happens to be an "ANDRAE," even if it is the oldest in the bunch, you will find it running in perfect condition, giving the same strong, steady-ringing current that it did the day it left the factory. This comes from careful construction, high grade imported steel magnets, positive shunt springs, with perfect connections, good insulation and no sharp corners to cut it; all of the little things that cost money and *cannot therefore be put into cheap telephones.*

I have tested a great many generators, but have not found one that gives the good, honest, rough and tumble wear and tear, long life and power of the "ANDRAE GIANT." All the parts of the Special Heavy Giant Bridging telephones are made on the same scale. You can depend on them to-day, to-morrow, next week, next year and years and years to come.

CONDENSERS

You will notice I still have a condenser attached to my instrument. I told you a little about this last month. If I could not get another, money would not buy this one. You people who are operating party lines without condensers, and wearing your lives out trying to chase up ringing troubles, don't know what you are missing. The sooner you get a few condensers on your party lines the happier you will be. If you are thinking of doing it to-morrow, do it to-day. It costs absolutely nothing to try them. Prices: No. 300, 85c. each. Lots of 50, 10c. discount. No. 301, 90c. each. Lots of 100, 15c. discount.
